COMPACTS, INTERSTATE. The interstate compact is one of the forms that federalism gives to the endlessly flexible, increasingly significant uses of the contract as an instrument of government. In the United States the term is derived from section 10 of article 1 of the constitution, which, after declaring that "no State shall enter into any Treaty, Alliance, or Confederation," provides that "no State shall, without the Consent of Congress, . . . enter into any Agreement or Compact with another State, or with a foreign Power." This, although in form a prohibition, is important practically as an authorization with congressional consent. Of the other federal constitutions that of Switzerland contains the most comprehensive authorization, allowing the cantons "to make conventions among themselves upon legislative, administrative, or judicial subjects" (art. 7) and "treaties with foreign powers, respecting the administration of public property, and border and police intercourse" (art. 9). The express provision in Germany is confined to foreign treaties by the Länder on matters within their legislative competence (art. 78); in Austria, on the other hand, to merely internal arrangements (art. 107). The constitutional stipulations in the federal systems of Latin America also lack the scope given in the United States. In Brazil provision is made for "mutual agreements and conventions of a non-political character" (art. 65); in Argentina, for "partial treaties for the purposes of the administration of justice, the regulation of financial interests, and the execution of public works of

common utility" (art. 107); in Mexico, for "friendly agreements" regarding boundaries (art. 116). The constitutions of Canada and Australia are silent on the point. Agreements in those countries are frequent, however, both among the provinces or states and between them and the central authorities. In all governments, whether federal or unitary, conference and contract arise inevitably on bases more natural and universal than the phraseology of constitutions. Even where explicit permission exists, as in the United States, the bulk of contractual understandings are reached in practise without reference to it.

The constitutional terms themselves have acquired no precision of meaning. Alluding to the words "agreement or compact" the Supreme Court remarked: "... we do not perceive any difference in the meaning, except that the word 'compact' is generally used with reference to more formal and serious engagements than is usually implied in the term 'agreement'" [*Virginia v. Tennessee*, 148 U. S. 503, 520 (1893)]. Congress, uncertain, has tended to couple them. The vital consideration is that, regardless of terminology or form, their contractual character has been established. In an early case the Supreme Court declared that "the terms compact and contract are synonymous" [*Green v. Biddle*, 21 U. S. 1, 92 (1823)].

The question of how the consent of Congress may be given and the more important question of when it may be dispensed with altogether remain full of doubt. The Swiss constitution invites less ambiguity by requiring action by the federal assembly "only in case the Federal Council or another Canton protests" (art. 85). In the United States, Congress has sometimes assented in advance; oftener it has acted after the conclusion of the agreement. Its consent may be implied, as was illustrated in the already cited case of *Virginia v. Tennessee*, holding that a compact made ninety years before had been approved because the boundary it involved had been recognized by Congress in connection with judicial and congressional districts and otherwise. Not all interstate agreements, moreover, require even the shadow of consent. This is the emphatic pronouncement of practise and is supported by unquestioned dicta. Where is the line between those that require the assent of Congress and those that do not? "We can only reply," it was said in *Virginia v. Tennessee*, "by looking at the object of the constitutional provision and construing the terms 'agreement' and

'compact' by reference to it . . . it is evident that the prohibition is directed to the formation of any combination tending to the increase of political power in the States, which may encroach upon or interfere with the just supremacy of the United States." With the receding risk of sectional intrigue or military opposition this doctrine would lead to an extremely narrow construction of the requirement of congressional consent, if it were not for the multiplication of the points at which a national interest is involved in problems which can be matters neither wholly of central nor local concern.

It is significant in this connection to note the extent to which the national government has recently participated in the negotiation of compacts. Before 1921 all interstate agreements formally approved by Congress were drafted without previous permission by it, leaving out of account a few to which it consented in advance. In the case of the Colorado River Compact, concluded in 1922, finally approved in 1928 (45 Stat. 1057, 1064) contingently on its acceptance by six instead of seven states and proclaimed as effective on June 25, 1929, the delegates originally chosen under state laws requested in 1921 that the national government designate a representative to sit with them. The statute they evoked (42 Stat. 171), permitting the formulation of a compact on the condition that a national agent be allowed to participate, has set a pattern for procedure in proposed agreements regarding water rights in the public land states. It has been copied in the following authorizations: Columbia River (Washington, Idaho, Oregon, Montana, 1925, 43 Stat. 1268, the time limit having been subsequently twice extended); Snake River (Idaho, Wyoming, Washington, Oregon, 1926, 44 Stat. 831); Belle Fourche and Cheyenne rivers and "other streams in which such states are jointly interested" (South Dakota and Wyoming, 1927, 44 Stat. 1247); Rio Grande, San Juan, Las Animas rivers, etc. (Colorado and New Mexico), Rio Grande, Pecos, Canadian rivers, etc. (Oklahoma, New Mexico, Texas), Cimarron River, etc. (New Mexico and Oklahoma), Gila and San Francisco rivers, etc. (New Mexico and Arizona) and Arkansas River, etc. (Colorado, Oklahoma, Kansas)—all by separate acts on March 2, 1929 (45 Stat. 1502-3, 1517); and supplementary agreements regarding the Colorado River (1928, 45 Stat. 1059, 1065). The force of these examples is only slightly weakened by the fact that the La Plata River Compact

between Colorado and New Mexico (concluded 1922, approved 1925, 43 Stat. 796) and one between Colorado and Nebraska regarding the South Platte River (concluded 1923, approved 1926, 44 Stat. 195) were arranged without the previous permission of Congress. The bilateral character of many of the foregoing proposals elicited repeated warnings from the secretary of the interior against agreements that fail to consider whole drainage systems. Aside from a boundary settlement between New York and Connecticut in 1911-12, belatedly "consented" to by Congress in 1925 (43 Stat. 731), the other compacts that have received the formal assent of Congress since 1921 have concerned bridges (Lake Champlain Bridge, New York and Vermont, 1928, 45 Stat. 120; Menominee River Bridge, Wisconsin and Michigan, 1928, 45 Stat. 300; Red River bridges, Oklahoma and Texas, 1930, 46 Stat. 154). The last of these is an instance of pre-approval. Such projects, however, are subject to control—at present, congressional consent subject to supervision by the Department of War—under the commerce clause of the constitution.

The fact just noted explains in part why it is difficult, almost impossible, to identify all of the virtual compacts to which Congress has in some way assented. Frequently Congress authorizes the private construction of a bridge over a boundary river with the stipulation that either or both of the states may take it over. Sometimes one state is authorized to build it, subject to the other's right to acquire a half interest; an arrangement of this kind gave rise to the contract enforced in *Kentucky v. Indiana*, discussed below. Sometimes authority is given without particularization to two or even three states [see for example Mississippi and Ohio River bridges, Missouri, Illinois, Kentucky, 43 Stat. 999 (1925)]. A growing number of instances of bridge legislation not treated as compacts recognize joint agencies of various kinds, although none of these is as complete as the Port of New York Authority or, on a much smaller scale, the Lake Champlain Bridge Commission. A single example serves to point the important lesson of the utility of a carefully considered formal agreement instead of reliance merely on concert effected through concurrent legislation. The Delaware River bridge at Philadelphia was built by a joint commission on the basis of laws passed by Pennsylvania and New Jersey in 1919. Congress sanctioned it as a bridge project (1921, 41 Stat. 1101); it was financed by the states

separately. In 1925, shortly before its completion, Pennsylvania declared by law that it should be free. New Jersey, alleging that its bonds had assumed tolls, countered by attempting to stop construction. Pennsylvania began a suit but early in the following year paved the way for an agreement by repealing its declaration against tolls.

Interstate compacts have been extolled as a method of dealing with problems beyond the limited powers of the nation and the incongruous physical limits of the states. They have been urged not merely as an expedient but as a desirable substitute for national action. Speaking from the other side Edward S. Corwin has said: "The compact clause can undoubtedly be utilized to good effect in those situations in which the national government is in position to force action under it as the alternative to direct national control. As a means of solving problems created by an untethered state selfishness it is probably of very limited value" ("The Lessons of the Colorado River Compact," *National Municipal Review*, vol. xvi, 1927, p. 461). The device of the compact is scarcely a substitute for national action. It is likely that the long time view will see both forms of action take their places with other elements as parts of the process which is crisscrossing all political boundaries with the lines of functional union.

On the administrative even more than on the judicial side compacts are likely to draw strength from national infusions. This will be true even if interstate agreements go further than in the past in creating genuinely cohesive, autonomous agencies of regional jurisdiction. Pregnant possibilities of course exist. The water compacts thus far approved, however, have been little more than guaranties regarding stream flow to guide the states in their separate action. The Rio Grande Compact approved by Congress on June 17, 1930, is in part an exhortation to the national government to augment the river by vast engineering works; the interstate committee that it sets up is confined to investigations, with the proviso that its findings of fact shall not be conclusive in any court. Embryonic regional organs are many, but the only well developed examples achieved through compact have been the brilliant accomplishment embodied in the Port of New York Authority (approved 1921-22, 42 Stat. 174, 822) and the application of the same idea for a very restricted purpose in the Lake Champlain Bridge Commission.

To say this does not belittle the usefulness of compacts, among their other advantages, in facilitating various kinds of extraterritoriality and thus in releasing the energies of the states individually. Numerous agreements, some of which are in the form of reciprocal legislation without consent by Congress, have made possible concurrent jurisdiction over boundary waters. An example of a different type is a provision in the South Platte River Compact, whereby Colorado and Nebraska enjoy the right to construct ditches in each other's territory. A compact approved in 1922 (42 Stat. 1058) guarantees that waterworks owned by Kansas City, Missouri, and located in Kansas, will be free from taxes there, while the same exemption is extended to waterworks owned by Kansas City, Kansas, and located in Missouri.

It has not been demonstrated that compacts in themselves will make possible more effective regulation of privately owned utilities. One suggestion of this sort concerned the marketing of anthracite coal in 1925-26 during the large anthracite strike, but it had no results. Another suggestion had to do with the stabilization of oil production, but a regional conference in June, 1929, failed to crystallize the movement for a compact, although it was evident that drastic restriction by the states separately would meet the stumbling block of interfield competition. The most important suggestions have dealt with the interstate phases of electric power. The impetus given directly by the Giant Power Board of Pennsylvania, which was constituted as an investigative body under a statute of 1923 and continued in 1925 by executive action of the governor after his legislative recommendations had been disregarded, led in the latter year to a conference of representatives of Pennsylvania, New York and New Jersey, attended also by official observers from seven adjoining states. Attempting to assume the desirability of a tri-state compact while discussing its terms, the conferees were unable to agree upon either subject matter or scope. Driven back to the main question they met the emphatic skepticism of the members of the New York Public Service Commission who represented that state. Following the withdrawal of the New York delegates the attempt to conclude a compact lapsed altogether. Subsequent criticism has noted other obstacles besides the aloofness of the state utility commissioners. Certain crucial factors like the holding companies are hardly regional at all. Legally considered, where interstate com-

merce is involved, the level of regional control can hardly rise above that possible for each state individually. To answer that such objections can be met by some kind of devolution under national legislation is an admission that compacts must find their role in the complicated movement toward a more cooperative type of federalism.

Another major use of compacts remains untried in the United States, although partial examples are available in the so-called concordats of the Swiss cantons. In its report of 1921 the Committee on Interstate Compacts of the Conference of Commissioners on Uniform State Laws stressed (in addition to state cooperation in the control of commerce and in penal and police matters, such as the much needed arrangement for the extradition of witnesses) two important phases of the relation of compacts to uniformity in commercial law. Neither was then a strictly new suggestion (see American Bar Association, *Reports*, vol. xxxiv, 1909, p. 1029; also, J. H. Wigmore in *Illinois Law Journal*, vol. x, 1916, p. 385, vol. xxiii, 1929, p. 734). One phase is the proposal that in adopting uniform state laws compacts should be used to restrain states from amending them except in unison. The other phase recognizes the need for international uniformity and the embarrassment of the federal system of the United States in meeting it. On this point the committee declared: "It is therefore absolutely necessary for the future international self-respect of this country that this power (of the states to make compacts with foreign powers) should be promptly exercised by the leading commercial States of the United States." It was urged that the national authorities should arrange for state representation at future international conferences affecting commercial matters.

The difficulties of adjudication as a means of interstate adjustment are conceded. It is true that in dealing with suits between states the court has rid itself of most of the numbing analogies drawn from international relations and has broadened its conception of the interest of the states in the affairs of their citizens. The judicial basis of adjustment is wider than the delegated legislative power. "Through these successive disputes and decisions," it was said in *Kansas v. Colorado* [206 U. S. 46, 98 (1907)], "this court is practically building up what may not improperly be called interstate common law." Special masters lighten the court's task. The court is not wholly without administrative

Compacts, Interstate — Companionate Marriage 113

resources. Repeatedly it has appointed and supervised boundary commissioners, assessing the costs on the states involved. In the case of *Kentucky v. Indiana* [281 U. S. 163, 700 (1930)], noteworthy because it enjoined specific performance of a contract between states, the highway department of Indiana was ordered to file semi-annually "a report to this court adequately setting forth the progress made." Interstate common law, however, cannot be a substitute for the creative force of legislation. The capacity of the court for continuous administration is narrowly limited. Even a successful decision can do little more than fix a starting point for the real settlement. A cogent illustration was the resolution of Congress in 1929 (45 Stat. 1444) requesting the president to confer with the governors of Texas, Oklahoma and New Mexico in order to arrange compacts for the complicated transfer of property made necessary by recent decisions of the Supreme Court in two interstate boundary suits which had been before the court since 1919 and 1913 respectively.

Adjudication has a place—crucial, but hardly prominent—in the future use of contractual relationships in producing varying combinations of governmental units. In 1925 representatives of New York, New Jersey and Pennsylvania unanimously signed an agreement regarding the use of the Delaware River watershed, but only New York ratified it; when the city of New York proceeded with its plan to draw water from the river, New Jersey brought suit. Even compacts less grudgingly hedged with saving clauses than those already approved in the field of water rights will bring their train of litigation. Doubtless such situations are not typical of a mass of essentially administrative agreements that will be made in the future. Of the thousands of written agreements now existing between national and state authorities a negligible number have reached the courts even obliquely. Such a condition is wholesome. Nevertheless, as increasing weight is put upon compacts, interstate and national-state alike, the courts can strengthen and steady the fabric by establishing further the fact of their enforceability.

COMPAGNONNAGES. See JOURNEYMEN'S SOCIETIES

COMPANIONATE MARRIAGE. Companionate marriage is a product of the industrial revolution. By that time, with the encroachment of money economy upon the older personal relationship and blood ties, the vestiges of the larger patriarchal family, consisting of several generations within a single household and discipline, had already largely disappeared from western European society. The factory system, which arose in the eighteenth and nineteenth centuries, reached into the family for individuals, drawing out men, women and children separately and rewarding them on a personal basis. Production left the home and education for the trades and professions followed. The rise of compulsory public schooling finished the cycle, depriving parents in growing urban communities of the productive services of their children outside the household. From being an economic asset children have become a heavy financial liability.

The home too has been economically transformed. Economic life is now in terms of money income. To add substantially to the money income the wife must generally work outside the home. Even what might be called "consumptive production," or the skilled preparation of pur-

chased raw materials for family consumption, has declined in importance as these processes have migrated more and more to the factory. The economic functions of the wife are reduced largely to those of a purchasing agent on an extremely small scale. If she has the financial capacity to turn these penny economies into anything even roughly equivalent to an income she is likely to rebel at spending her talents on such a job.

Companionate marriage is one answer of those whom the factory system has thus forcibly inoculated with economic individualism but whom the limits of the conventional family have prevented from exercising it. The perfecting of birth control methods and their general availability have provided a fairly reliable means of avoiding the burden of children. Salaried men and women in the trades and professions can now marry legally and even under the sanction of most churches without giving up the separate income of the woman or impairing her customary work. The "companionate," as this type of union was styled by the writer in 1924, is thus legally a "family," though it omits the central functions of the historic family institution: the bearing, rearing and education of children. Far from being the familiar sociological family unit, it is a union for companionship and mutual personal advantage.

Deliberately sterile marriages are not a new thing. They were given a distinctive name merely because they were growing so numerous in the cities that it seemed useful to contrast their peculiarly limited functions with those of the complete biological family. The companionate is not itself an institution, but merely a truncated form of a familiar institution. Sociologically, however, it is a good deal more than an arrested or rudimentary biological family. The peculiar common interests of the family with children are not only absent but have been replaced by others. Widely as writers on companionate marriage have differed about other things, all have refrained from applying the term to unions in which the woman is merely sterile.

The boundaries of the companionate are much too vague and shift too erratically to permit of classifying it entirely separately, even if it had any vital functions of its own to perform for society or the state. Some of the pairs use a common residence; some share the same family name; some earn approximately equal incomes; some pool their incomes; and some do none of these things. We might add that some com-

panionates exist from choice and some through the necessity for two incomes. Some are temporary and some are permanent. The only general requirement seems to be that both partners to the marriage refrain from reproduction in order that both may continue to hold their competitive places in economic society. As far as society and the state are concerned, however, those unions where sterility is involuntary could be added to the category if they conform to type otherwise. On the other hand, if the desire for economic independence is to be the criterion, we should exclude marriages where the wives are companionate through economic necessity. If we use this criterion, however, we are embarrassed by another group in which husbands and wives continue their separate employments in spite of one or more children. There is, finally, no solid basis for calling the companionate union a separate institution when it may become a family by the failure of contraceptive methods or because the partners change their minds.

The controversy about companionate marriage may be clarified by disentangling three separate aspects of the companionate that have commonly been confused. There is, first, a situation, growing out of the triumph of money economy and the factory system, which has dissolved important elements in the historic family institution. Second, there is the formation by an increasing group of shrewd individualists of a companionate type of union which avoids the growing burdens of the complete biological family without departing from its legal and social framework. Finally, certain reformers have turned a descriptive label for the above group into a slogan for making over marital relationships in general in line with their ideas. The word companionate has the proper vagueness and suggestiveness for a slogan, although not created for that purpose. In fact, its coinage was quite casual and unpremeditated, its direct antecedent being a pun of the French humorist Clément Vautel on the word *compagnonnage*.

As might be expected, these reformers do not agree with one another. They have presented a fairly solid front in public to an immense and furious group of opponents who deny that change in the family institution is necessary beyond minor details. Students of the social sciences have listened more calmly to assertions that the family has not kept pace with rapid economic change and with newer ideas of human relationships which have penetrated to the less

conservative institutions. Although both have expressed themselves at length on companionate marriage Bertrand Russell and Judge Lindsey, for example, are worlds apart when they turn from demolition of the conventional family to reconstruction. Russell's view "that the state and the law should take no notice of sexual relationships apart from children, and that no marriage ceremony should be valid unless accompanied by a medical certificate of the woman's pregnancy" (quoted in Lindsey and Evans, *The Companionate Marriage*, p. 210) does not call particularly for companionate marriage but for anything from free love to unregulated companionates for the childless. It is the continental mistress system divested of its stigma and extended to all classes. Russell would like all parenthood to be voluntary. This is a good deal to expect, without legal sanctions, from human beings as they now exist—especially considering the fact that under a reign of initial free love not parenthood but non-parenthood would have to be consistently willed and flawlessly planned.

Although Lindsey and Evans in America have quoted Russell's remark as an endorsement of their own propaganda, the companionate they urge is a married one. To Judge Lindsey companionate marriage means birth control, uniform and rational divorce laws and instruction and sensible advice for the young. He would have people marry for companionship fairly young, avoid children until the unions are solidly established and divorce each other by mutual consent in case of failure. Although this is evidently marriage on probation or trial, Judge Lindsey emphatically denies that it is "trial marriage." The distinction, he insists, is one of "psychological emphasis," the term companionate being reserved for the more "confident" entrances into marriage. Close study of his argument in support of an apparent contradiction shows that he has confused two meanings of the word marriage. The same word is used to designate the ceremonial and contractual act of entering the state of lawful wedlock and also that state or institution itself. Certainly the confident approach is devoutly to be wished, whether the union itself is to be voluntarily sterile for a time or fruitful at once; but such pious hopes have little to do with a concrete discussion of institutions.

The word companionate was found useful by some sociologists as long as it merely designated the arrested form of the family which retains the historic privileges without performing the vital

functions. This growing subdivision of the family institution into sterile and fertile groups raises not only questions of what is immediately good for individuals as such, or agreeable to them, but also very broad issues concerning the permanent interests of society at large. The observation of this subdivision involves the separate labeling of different things, no matter how much they may be confused in the language of the drawing room or the street. When a term used for this purpose acquires a high emotional temperature by being turned into a slogan to carry vast yearnings about the future, social science has no choice but to give it up. Henceforth it is of interest, like other organized popular propaganda, for its crude mass effects.

COMPANY HOUSING is the group of activities undertaken by industrial companies in order to house their own employees. It should be distinguished from the housing of agricultural workers on plantations and from the temporary sheltering of workers in labor camps. It had its origin in the primitive, pioneering conditions prevalent in industries which were isolated because they depended upon raw materials and power in secluded regions at a time when transportation was poorly developed. As an institution it represents a carry over from the days of agricultural feudalism, when it was the landlord's duty to provide a complete standard of living for his serfs.

In the United States company housing is as old as the industrial history of the country. It has moved with the industrial frontiers: the New England textile towns of the 1840's, the anthracite coal towns, the bituminous coal mining communities in Pennsylvania and West Virginia, the southern coal regions and Alabama iron mines, the coal mining sections of Colorado and

Wyoming, the copper mines in Michigan, the metalliferous mines of the far West and today the mill towns of the South. Company houses have constantly appeared in new regions, but those in the older sections have generally continued to exist.

Employers have embarked upon programs of housing for their workers for a great variety of reasons. The coal mine operator and the metal mine owner, for example, must supply living quarters because of the isolation of their enterprises. The other principal reasons for housing ventures have been: to maintain a permanent and stable labor force so that a nucleus of workers, particularly skilled men, would be available at all times; to reduce labor turnover in general; to control workers, particularly in time of strike, through the eviction of strikers or the housing of strike breakers; to attract married men; to facilitate part time employment; to create a collateral business; to develop popular esteem through this special phase of welfare activity; to encourage decentralization of industry; and to satisfy a humanitarian urge, which is sometimes vague and sentimental.

Employers have usually supplied the conventional type of house prevailing in a given region; the tall frame structure with one or more families on each floor in the New England region, the so-called shotgun cottage with three rooms in a line in the southern mine and mill towns, the single or double board and batten frame house of the mining region, the square hip roofed cottage of the West and the semidetached row or even apartment house in congested districts where land is expensive. The detached house still constitutes nearly half, the semidetached over a third, and the row type not quite one eighth, of all company housing types. There is a distinct tendency toward uniformity of type, and company houses generally present a dreary sight. However, during the World War the appearance and quality of company houses in the United States was improved through the influence of government architects and planners connected with the Emergency Fleet Corporation, which encouraged subsidized company housing, and with the United States Housing Corporation. Since then the better types of company house, although uniform in plan, have tended toward artistic individuality in the so-called model industrial villages.

Over half of the company houses in the United States are of four rooms or less. Five and six-room houses constitute each about one

sixth. About nine tenths are frame structures. Only a small proportion of company houses have any modern conveniences; less than a third have inside toilets and only about one fifth have gas or electric light. It is in the mining regions that one finds the worst conditions in these respects. It cannot be definitely said whether these conditions are generally better or worse than those of workers who supply their own housing. Examples may be cited, however, of certain companies which had disposed of their houses to employees and were forced to buy them back because of exploitation by landlords and because the standards of housing for the whole village were lowered by poor upkeep and unsanitary conditions and the lack of individual or private care. In eastern coal fields the company houses are scarcely more than shacks, with the standards of plumbing and sewage very low. Here the miner neglects the small repairs and the company the larger ones.

Company housing does not generally apply to all of the employees of the companies which undertake housing. Governmental studies in 1916 revealed that approximately a third of all the employees of over four hundred establishments investigated actually occupied company houses. Additional government reports, which appeared between 1920 and 1925, indicated that the approximate percentages of employees living in company houses in certain major industrial areas were 71 in the southern textile region, 61 in the bituminous coal fields, 22 in the Massachusetts cotton textile manufacturing industry, 18 in iron and steel manufacturing communities and less than 10 in anthracite mining regions. In the better maintained villages, where the percentage of occupancy of company dwellings is less, it is rarely the wage earner, but the managerial and technical office staff, that is housed.

The company house is usually rented by the employee and is therefore a "tied house," in which the industrialist is both landlord and employer. This enables him to use his position as landlord for fighting labor organization and to include housing as an important unit of a program of welfare capitalism. Evictions of strikers and their families, frequently performed in the harshest manner, have for years been a notorious feature of the American industrial scene and have generally meant severe suffering for the evicted. In isolated communities where evictions have occurred it has not been unusual for union tent colonies to spring up beyond the limits of

company property to care for those dispossessed by the employer. Employers maintain that they have room in their houses only for active workers, so that when they evict their employees whom they have discharged for striking or for other reasons they are merely enforcing their property rights. Thus the loss of a job practically means the loss of a home. This right of eviction gives the employer an effective weapon for terrorizing and dominating his employees.

Although Pennsylvania statutes entitle a tenant to thirty days' written notice to leave before eviction proceedings begin, a large proportion of the leases for Pennsylvania coal company houses require the tenant to waive this right. Instead, the leases generally provide for between only five and ten days' notice to the tenant. In addition, the lessee is usually required to waive his right to a trial if ejection proceedings are brought against him. In West Virginia the relationship between landlord and tenant in company towns has been held by the courts of that state to be one of master and servant. This ruling permits evictions without reasonable notice.

In the more built up sections of the country employers have worked out schemes for selling the houses to their employees through such methods as company revolving funds, subsidiary housing agencies, stock purchase plans and part payment plans. The majority of these houses have been purchased by the higher paid workers. In many cases houses sold under these systems have been built by employers as part of a general plan for the development of an industrial suburb.

Nearly all employers included in the government survey of 1920 were satisfied with the results of their housing. Nevertheless, opinion has been frequently expressed against the concentration of responsibility which makes the employer at once an industrialist and a community manager. In such a community "there is but one object to curse for everything—the company." The worker is dissatisfied with the system but is frequently forced to endure it, particularly in mining districts and in the newer textile regions, where the acceptance of a job generally means the acceptance of company housing. The American Federation of Labor has stood for municipal housing and housing aided by the state and federal governments without at the same time specifically condemning company housing.

In European countries the system of company

housing, while on a larger scale perhaps than in the United States, is carried out more indirectly through subsidiary companies and with the intervention of the state. There is little direct company housing as such except in the more isolated coal mining regions. The employer becomes an instrument through which the state exercises in part that particular function. There is as a rule no connection between European housing schemes and welfare practises, as there is in the United States.

Company housing existed in modern form in Great Britain in coal towns and around some of the new textile mills as early as the eighteenth century but has been most prevalent in the coal mining regions. In 1925 between a quarter and a third of all British coal miners lived in company houses, of which over a third were rent free. Overcrowding, dilapidation and poor sanitary conditions were common, and many dwellings were found by government inspectors to be "unfit for human habitation." Company housing has been connected with the British coal industry in one form or another for over a century and a half and has often been taken advantage of by employers who wish to fight labor organization. The institution had been so far developed by 1844 that during the great Durham and Northumberland coal strike of that year the ruthlessness of company evictions of strikers and their families was worthy of a Pennsylvania coal operator of 1928.

Since the World War some new methods have been tried to remedy the extreme squalor of the ordinary run of company houses in Scotland, Wales and North England. A beginning was made in Yorkshire by employers associated under the philanthropic leadership of Lord Aberconway. They acquired capital through government loans and by putting up joint capital of their own. Under able management this joint enterprise has constructed 12,000 houses, which are leased to the colliery companies on thirty-year repairing leases. They have all modern improvements and attention has been given to site and community amenities.

The employers' housing enterprises at Bournville and Port Sunlight are still the outstanding examples in modern industrial villages. The part of the employer here is principally to prevent land exploitation. The housing work is done through the public utility building societies, which limit dividends and are favored with government loans and which receive governmental supervision and architectural and town

planning aid. Bournville was started in 1895 by George Cadbury as a semiphilanthropic venture, and in 1900 the property was turned over to the Bournville Village Trust, which controls the whole estate outside the Cadbury cocoa factory. It has erected more than eight hundred houses of relatively good quality. Rents are fixed so as to net a return of 4 percent on the cost of the site and construction, and profits are applied to public purposes. There are also several philanthropic enterprises which have built houses in the community; but the underlying control of the land rests with the employer's village trust. The trust has also acted as a promoter of good housing among other employers.

Although French coal mining companies and private railway companies engaged in a considerable amount of company housing prior to 1914, after the war the practise was greatly stimulated by the need for new and additional housing in devastated areas. Employers around Lens and Anzin in the northern coal mining district erected modern sanitary houses for their workers. Railway companies and textile mill owners have also contributed to the supply of company houses since the war. Firms belonging to the metal, mining, electrical and engineering industries combined to establish two organizations to aid associations of employers in these industries to build cheap houses for their workers.

German employers have engaged in housing in both the older and the newer industrial areas. The Krupp firm is among the most famous in the former field. It started in 1861 to build company houses and by 1919 housed 12,000 of its employees. It also made loans to employees who preferred to build houses of their own. Some German companies encourage collective building among their employees. State loans are extended to employers for housing purposes, subject to the usual restrictions of limited dividends, maximum rents and quality of accommodation. Laws have been passed in Prussia, Bavaria and Saxony under which employers may be forced to contribute to the housing of their employees, but numerous houses have been built by German employers without public aid or compulsion.

In Latin America company housing is being increasingly engaged in by foreign business enterprises. The practise is found in the sugar mills of Brazil, in the metal mining and nitrate companies in Chile and in the basic industrial

and agricultural developments in Costa Rica, Cuba, Ecuador, Haiti, Honduras, Peru and Paraguay. Near Asunción, to cite an example, meat packing concerns have erected groups of one-story houses containing living room, two bedrooms, kitchen, bath and porch. Each house has a garden and each community a modern, well equipped playground.

In the Asiatic countries also it is the foreign concessionaire who has found it convenient to include housing as a capital cost in his enterprises. A typical instance is that of a considerable number of Bombay mill owners who during the last few years have erected an increasing number of dwellings for their employees. These enterprises have been uneconomic except in so far as they tie the workers to their jobs; but they secure no greater efficiency nor any less absenteeism. In the mining regions of Japan one finds the complete institution of houses, stores and community, all owned, managed and controlled by the operator.

Japan also has a peculiar type of company housing known as the dormitory system under which employers either shelter their workers in dormitories built near the factory or turn the second story of their factories into sleeping quarters. This system of industrial barracks has been primarily designed to shelter the great number of workers, especially young girls and unmarried women, who have been attracted by factory recruiting agents from distant villages. The system has reached its greatest development among female textile workers, although 37 percent of all Japanese wage earners in factories, mines and transport were housed in dormitories in 1926 (83 percent of these were females). Most of the dormitories are overcrowded, although conditions are better in some of the newer dormitories. In 1927 governmental regulations were promulgated to promote the health, safety and freedom of women dormitory dwellers.

COMPANY STORES. See COMPANY TOWNS.

COMPANY TOWNS. A community is known as a company town when it is inhabited solely or chiefly by the employees of a single company or group of companies which also owns a substantial part of the real estate and houses. Such a community is typically unincorporated; it may, however, be part of a larger, incorporated municipality or it may be a separate, incorporated town. This article deals only with permanent or semipermanent communities, but many of the conditions herein described are characteristic also of purely temporary logging and construction camps and of certain plantations and tenant farming communities.

Company towns have existed in several countries. They are found, for example, in eighteenth and nineteenth century British coal fields, around twentieth century coal mines in Japan and at the Krupp works in Germany. But it is in the United States that the company town has reached its greatest development. Here it is met with in nearly every important industry. The total number of people living in company towns is probably in excess of two million, and if dwellers in company camps and farm tenants working under the direction of an overseer were included this figure would have to be greatly increased.

The isolated company town is a major social problem. Isolation may be geographic or social. Geographic isolation is sometimes imposed by

the nature of the case, as with the extractive industries or with industries dependent on water power, but it may also be sought deliberately. Thus in the United States the establishment of cotton mills in isolated sections of the southern Piedmont region resulted in some measure from an attempt of northern capitalists to escape both the higher wages and the higher taxes of New England. Geographically isolated towns have few connections of any kind with the rest of the world, and this frequently results in the stagnation or degradation of their inhabitants. Social isolation also occurs when Negro and immigrant company towns adjoin native white communities but have few contacts with them and when as in many of the new industrial cities of the South an invisible barrier exists between the native white inhabitants of the company town and the rest of the city's residents.

The purpose of the company town is to attract, hold and control labor. When a new plant is opening up in an isolated community the company must make some provision for its prospective employees and often finds it necessary to house them all. If the houses so built are not afterwards sold off, the company town becomes a permanent institution. Company towns are also built near established communities: scores of such "towns" were built during the World War, when the problem of labor turnover became serious.

The company town as such is usually not run as a money making proposition. The United States Bureau of Labor Statistics found that a gross return of 8.3 percent on the investment was typical. Rents are generally low; a few companies charge no rent at all. Although the town may be a success from the standpoint of the labor manager and may even provide its inhabitants with somewhat better housing than they had previously experienced, it has many decided drawbacks from the point of view of the tenant workers. Most of these drawbacks result from the combination of the functions of landlord and town manager and employer. Indeed, it is the question of control which overshadows all other problems in the company town.

There are certain objectionable features in connection with housing. First, there are those to be found in insecurity of tenure and in the unnecessarily poor quality of most company housing. Secondly, the company's usual policy is to install the largest number of workers possible in each house. Where only some of the

employees are housed by the company discrimination may be shown in favor of the families who take in boarders and lodgers or who withdraw their children from school to send them to work for the company. If a house ceases to supply any workers to the plant—because, for example, the tenants are on strike—the company may and commonly does evict the tenants. Thirdly, the low rents are frequently a cause of low wages. Finally, tenants in company houses are more apt than other workers to be called on for compulsory overtime work in an emergency.

With a few notable exceptions the planning of company towns has been below approved standards. A large majority of towns are unsewered and the houses have no running water. Other defects are summarized as follows by John Nolen, a noted town planner: "The houses and other buildings have not been well placed or grouped, and there is no real recognition of street and site planning. The architecture almost invariably has been commonplace, or worse. The provision for play, outdoor recreation and social relaxation has usually been altogether inadequate. The communities have been too small in total area and population for a satisfactory social life. Finally, sufficient attention has not been given to the very important matter of the management of these housing enterprises, after the buildings were once erected." Some company towns are managed with laudable efficiency; in many others the houses go unpainted for years at a time, garbage is collected seldom and ashes never, repairs are left to the tenants and the streets in the rainy season are quagmires.

The company usually participates directly or indirectly in the control of church and school. Sometimes it owns both institutions; quite often it subsidizes the salaries of school teachers and ministers, and some high official of the company is frequently found on the school board and on the governing body of the church. Several cases are on record where ministers and teachers who attacked the company's policy have been forced to leave the town. Responsible church bodies have condemned this condition but have not corrected it.

Two recent studies on the advancement of school children in North Carolina have confirmed the popular impression that schools in company towns are below average. One of them attributed the poor showing of the children in company towns in part to "the lack of stimulating influence in the mill school and a mill en-

vironment." There is now a slight tendency for the public authorities to assume greater control of schools and for the influence of the company in school affairs to diminish.

Company stores (also known as commissaries) are widely found in company towns. They may deal in a large variety of goods or confine themselves to a few lines. The motives in conducting such stores are various. Some were opened during the World War to help combat the high cost of living and were closed again when prices became stabilized; most have been established to supply the inhabitants of the town with the necessities of life at a time when no other sources of supplies were available. Some are continued for profit; certain employers make more money on their company stores than they do on their main enterprise. Some company stores sell at cost. Some follow an intermediate policy, retailing groceries at cost and clothing, furniture and other goods commonly sold on credit at unusually high prices.

Company stores are a continual source of irritation to employees, who commonly refer to them as "pluck me" stores. The United States Coal Commission made in 1925 a careful comparison of the prices charged by company stores and independents. Presumably it compared cash stores with cash stores and credit stores with credit stores. It found that prices in company stores were seven percent higher in an Alabama mining town and four percent higher in the Kanawha district of West Virginia for goods of apparently the same quality. The company store has special competitive advantages. It is always favored by a location convenient to the purchasers. It commonly carries a larger stock of goods than the independent roadside stores. When the company contemplates a shutdown or an increase in the scale of operations, the company store is appraised in advance and can diminish or increase its stock. The manager of the company store has access to information regarding the earnings of his customers and uses this information in granting or withholding credit.

Even more serious than higher prices are the compulsory features of certain company stores. In many towns no other stores exist. Where workers are paid in scrip (store orders) in place of cash or in advance of pay day they are forced to have recourse to the company store, since it alone can redeem scrip. In times of slack work, when the plant is operating part time and pay envelopes are correspondingly small, the whole

community goes on to a credit basis and the company store flourishes accordingly. By making credit unduly easy the company store even encourages wasteful buying, and the company may aid in the collection of debts to the store. Finally, it is known that foremen and other company officials frequently influence the men to trade at the company store and that men have been discharged for no other reason than trading with independent dealers. The manager of the company store sometimes has to pay for this co-operation from foremen.

Company stores have had a longer history than the company town and have existed independently of it. They have been a curse to the workers of many countries. In England, where they were a particularly frequent subject of complaint during the nineteenth century, they are known as "tommy shops." Here the forced acceptance of store orders in place of money wages was for long especially serious. Institutions similar to the industrial company store also have long existed in agricultural regions, and seamen have suffered for centuries under the exactions of the ship's "slop chest."

Company stores have almost universally acquired an unsavory reputation. England started to legislate against them in 1831. Truck acts passed in that year and in 1887 and 1896 provide with some exceptions that workmen may not be required to spend any part of their wages at a particular shop and that wages must be paid in the coin of the realm. Most industrial states of the United States have passed laws for the control or even elimination of company stores. Laws of the latter class have not had much effect; in Pennsylvania, for example, it is illegal for a mining company to run a company store but not illegal for the stockholders of the company to be, as they commonly are, the owners of the store. In France also the company store has survived laws aiming at its abolition; it is run as a co-operative, with the controlling interest in the hands of a few salaried employees. A third type of law has prohibited companies from forcing employees to trade at company stores and has compelled payment of wages in lawful currency. The practices which these laws were designed to correct have declined, but the effect of the laws is difficult to trace and abuses are still widespread. It is of interest that on both sides of the Atlantic truck acts have commonly been ineffective when workers have not been strong enough to compel their observance. Laws for regulating prices at company stores are usually

accompanied by such weak administrative provisions that they are of little or no effect.

The number of company stores is apparently diminishing, but they are still numerous. Where they come into active competition with independent stores, especially chain stores, the abuses incident to their operation are in effect limited to those inherent in the credit system. One check on the abuses of the credit system is found in more frequent pay days, a reform which has been advocated for many years by the United Mine Workers and other trade unions.

Where there is no trade union and the company's economic control over the town is undisputed its political control is taken for granted, and if the company has no wider political ambitions political life in the company town is inactive. Some southern textile towns do not even go through the formality of an election. But when the company desires to have a voice in some larger field, such as county, state or national offices, its foremen may at election time act as bosses for the favored party, lining up the largest vote possible.

The company must have a certain amount of political control if it wishes, as it often does in isolated towns, to keep the company town closed to "undesirables," in which class are usually included hucksters, peddlers and especially "agitators." The last category consists of any individuals who might organize an opposition to the company's economic or political control, especially trade union organizers. So solicitous is the proprietor to preserve the peace of mind of his employee tenants that he often builds a fence around the "town" and stations guards at the entrance. The walled-in company town is a common feature of the American landscape. The guards are technically officers of the law. In the state of Pennsylvania they are known as industrial police and formerly were known as coal and iron police. Their salary is paid by the companies whose property they protect. In most states the guarding is done by deputy sheriffs, and accordingly the control of the office of sheriff has become a prime interest of the employer.

In the mountain fastnesses of West Virginia whole counties are "closed." Thus in 1922 some thousands of union coal miners, finding that it was impossible for union organizers to enter Logan county, West Virginia, marched on Logan. They were dispersed by federal troops and by the influence of the United Mine Workers of America. Logan county is still closed.

With the development of technically interlocked industries towns controlled by several companies, such as Kingsport, Tennessee, and Longview, Washington, have appeared. It is not clear, however, that this diversification necessarily diminishes concentration of control. In both the towns mentioned the industries are financially as well as technically united.

The most serious abuse in the present situation is that the guardians of law and order are paid by the company. This system has today few or no public defenders, but it still persists. In West Virginia the payment of deputy sheriffs by coal mining companies has been condoned on the ground that the public authorities were unable to maintain law and order. The argument appears specious. During the coal strike of 1927-28 the West Virginia legislature made special emergency appropriations to meet the cost of maintaining order; they were turned back into the treasury unused and the coal operators continued to appoint their own mine guards. It has been repeatedly demonstrated that the employment of mine guards is a source of friction, and it is an open question whether mine guards are not guilty of causing more violence than they prevent. The way the system operates at present was thus described by the United States Coal Commission in 1925: "The clamor raised against these deputies caused a change in the method of paying them. The operators now 'loan' the county an amount equal to the extra cost of maintaining these special deputies. There is no record that their 'loans' have been repaid and the operators do not seem to be pressing for payment" (*Report*, vol. i, p. 173). Company funds have also been used to defray the extra expenses of the militia and the National Guard when these have been called upon to do strike duty, the advance being classified as a loan in these cases also. Legislation on this subject is urgently needed.

A second abuse which calls for legislative remedy is that of the closed company town. Trade unionism corrects this, but the day when all company towns will be organized is far distant. Nor is there much prospect of closed towns being opened through court action alone. The company can and commonly does assure its legal right to close its town by provisions inserted in the house leases. The following excerpt from a lease used by the Clarkson Mining Company in Ohio is typical: "... lessee will not use or suffer or permit to be used said lands or the private way or road through or over the lands of the

lessor to said dwelling house for any other purpose than that of ingress or egress to and from the public road for lessee and the members of his family, nor do any act or thing nor permit nor cause the same to be done whereby the public may be invited or allowed to go or trespass upon the lands of lessor." The United States Coal Commission entered a sharp protest against "house leases which prevent free access and exit," but no legislation resulted. In British Columbia the Company Towns Regulation Act of 1919 provides that any community which has been declared by the lieutenant governor in council to be a company town shall thereafter be open at all times to the general public.

Thirdly, the employer who is also the landlord is likely to abuse his power as landlord. In company towns the company, in addition to the power of evicting from its houses any of its workers and their families who challenge its supreme authority, may legally force them to go with their belongings beyond the limits of its private domain. This situation needs a fundamental change which will place control of employees' houses and the right to live in a town definitely beyond the employer's power.

Where control has remained unchallenged the abuses to which the company town is subject are as serious today as they ever were. Any effective move for decentralization of industry might well foster a new growth of company towns. Yet there are forces in operation which tend to weaken employer control. Foremost among these is improved transportation, which enables employees to live at a distance from their work. A coal mine employing one hundred and fifty men was recently opened near Butler, Pennsylvania, and operated for a year without a company town being built; the miners arrived each day by automobile and interurban car line from distances up to twenty miles. Improved transport has helped to break up the company town in the coal fields of Indiana and Illinois especially but has had little effect in mountainous West Virginia.

The company town which grows into an incorporated city develops independent businesses and the grip of a single company tends to be weakened. But the effect on company control of mere incorporation or of absorption of the company town into a larger municipal unit may be very slight. An aggressive, determined company may dominate a city of considerable size.

It is evident that for isolated non-union company towns, in which the employer owns all the

land, no effective steps have been taken to obtain for the employees the practise of those "immemorial rights" of free speech and free assemblage which are supposedly guaranteed by state and federal constitutions. There is no place where a meeting to criticize the employer's policy may be held. The employer controls the job and the political machinery; he dominates the school, the church, the organized amusements, the local business and professional men and often all medical service. The employee's freedom is limited to activities which do not tend to weaken the employer's control. Democracy is an empty mockery. Employees have no real property and no means of acquiring any. They are treated, in effect, like irresponsible children. The welfare work sometimes undertaken by employers can never compensate the employees for their lack of economic and political self-rule.

COMPANY UNIONS. As the name implies, company unions are "unions instigated and practically dominated by the employers, organized and conducted for the purpose of combating or displacing independent unionism" (Hoxie, p. 51). The terms company union and employee representation are often used interchangeably, especially in the United States, where trade unionists commonly refer to any shop committee, works council or industrial assembly established without the assistance of trade unions as a company union. In recent literature, however, company union has come to designate a special form of employee representation which not only seeks to become a substitute for the trade union but also uses the methods and the forms of organization of the trade unions. It is usually an employees' association within a plant making collective bargaining contracts with the employer. It is likely to employ such weapons as compulsory membership and the "yellow-dog contract," although this latter is most often used alone as a particularly drastic instrument against unionism.

While employees' committees, both as a part of trade union arrangements and as an attempt to establish collective relations where trade unions do not exist, date back to the middle of the nineteenth century, company unions for the purpose of combating or displacing organized labor are in the main a post-war American development. In Germany the "yellow trade unions," instituted in the late nineties by such employers as Stumm and in Great Britain the isolated attempts to establish profit sharing and copartnership schemes on the part of employers like Henry Briggs in the mining industry and Sir George Lavesey in the South Metropolitan Gas Company never gained much headway, because of the strength of the independent trade union movement. During the World War the United States War Labor Board established shop committees as agencies for collective bargaining in more than two hundred plants. The American Federation of Labor, which was represented on this board, intended that these committees should be dominated by the trade unions in the case of organized industries or should lead to the organization of unions where none existed. This was in fact the result of the establishment of the war committees. The employers, however, fearing that they might be forced to deal permanently with trade unions, put an end to the committees as soon as possible after the dissolution of the War Labor Board or replaced them

with other types of employee representative boards or with company unions. In European countries the strength and established position of the labor organizations prevented such a development.

Most of the early plans for company unions in this country were prepared by the management and were either put into operation by an order of the company or presented ready made to the employees for adoption. In more recent arrangements, although the initial move is made by the employer, the question of the desirability of a company union is voted upon by the employees, and joint committees of management and workers are elected to participate in the preparation of the detailed program, which is then submitted to a vote by the workers. If the result of this vote is favorable, representatives are elected to work with a committee of the management. The company union generally operates through elected representatives or officers of the employees' association, who meet alone and who submit their decisions to the management or its appointed representatives. Meetings of the entire association are infrequent and are practically without exception held within the plant itself. Proposals for the consideration of the company union may come from either side. Usually final decision on the action of the company union rests with the management; sometimes it is provided that the decision of a single representative of the management may be vetoed by a two-thirds vote of the company union, but in practise this course has very seldom been followed. Payment to officers of the company union for time spent in negotiation and conference may be made by the company or, in rare instances where company unions have a treasury, out of that treasury.

It has been estimated that about a thousand industrial establishments, employing nearly a million and a half workers, now have some form of employee representation. Except by careful study of their actual operation it is impossible to tell which of these establishments have real company unions and which are mere shop committees. The distribution of these million and a half workers by industries shows that 25 percent are in the railroad industry and that the railroad company unions have developed largely since the failure of the shop crafts' strike in 1922; almost another 25 percent work for other large scale public utility concerns. Large single corporations, like the General Electric Company and the Bethlehem Steel Company, each account

for a greater number of company union workers than all the printing and lumber industries combined. The National Industrial Conference Board estimated in 1925 that over 840,000 company union workers were engaged in plants employing more than 15,000 workers and that 57,000 were engaged in plants employing between 10,000 and 15,000. This estimate also indicated a general decline in the number of company unions in smaller establishments. It appears that the company union has been instituted where trade unionism has been most severely blocked. In industries of a monopolistic character or in highly capitalized corporations the company union serves as a convenient substitute for dealing systematically and in some regulated fashion with large bodies of workers.

While the persistence of many of these company unions has been due primarily to management interest and activity, certain weaknesses in current trade union structure and tactics have contributed at least partially to the acceptance of company unionism by many workers. The craft structure of American trade unionism would mean the division of the employees of most of these large corporations into a great number of separate international unions. Often trade unions do not include the majority of the workers and are therefore ineffective. Certain industries and trades are characterized by corrupt unionism. Immigrant workers have often been excluded by high initiation fees and other devices. Unskilled laborers, semiskilled specialized machine operators, women workers and Negroes have all been subjected to a variety of discriminations on the part of trade unions. Factionalism within the trade union and the necessity for vigilant participation by the membership to insure efficient management are likely to make the machinery of the company union appeal to many workers as simpler, even if less efficacious. Many trade unions have failed, moreover, to take advantage of supplementary negotiating and conference machinery which might be afforded by shop councils or committees of workers within the plants in order to make adjustment to the intricacies of modern industry and the variations in manufacturing processes from shop to shop.

As a means of equalizing bargaining power between employers and wage earners and improving conditions for the laboring classes company unions as now organized have certain fundamental defects. Organized labor always has a political and social program even when it

eschews a separate labor party; it employs legislative agents to look after labor's interests in matters of government and it secures the enactment of factory laws and other legislation designed to improve the lot of wage earners. Company unions, since they include the employees of only one plant or corporation, are in no position to take part in such activities. As long as they remain unfederated they must confine their activities to the plant or the plants of the company which employs them. This prevents them also from performing one of the most important functions of trade unions, namely that of forcing backward employers to adopt the standards of the most reputable and progressive. The long hours and low wages of the southern cotton mills are a matter of concern to the national trade unions; but the company unions do not send organizers to help the workers in these mills to improve their conditions. On the other hand, company unions profit from the existence of strong trade unions in other plants of the same industry. In such cases the wage standards won by the national unions are likely to be the standards which the company unions adopt.

Impartial studies of several company unions by the Russell Sage Foundation—especially of the Colorado Fuel and Iron Company, which was the largest pre-war company union experiment—suggest other weaknesses. Even within the plants a company union cannot do as effective work as a well managed union, because the representatives of the workers (with rare exceptions) must be employees of the company, not specialists in bargaining or trained labor sales agents like the officials of many trade unions. Nor are employee representatives paid by the employer likely to be as independent and forceful in protecting the interests of the workers as representatives chosen and paid by trade unions. The employer may honestly guarantee freedom of action, but the company union representative may nevertheless remain fearful of discrimination. In case of disagreement between management and workers on questions important to the wage earners a national union also has the financial resources to employ technical and legal counsel to aid the workers in a single plant, whereas members of company unions must rely either on workers in the plant, who may be ignorant and untrained in such matters, or else on the experts paid by the employer to advise the management. Such aid for employees is particularly necessary in cases of arbitration, but company unionism is hardly in a position to pro-

vide it. Perhaps this is the reason why arbitration is rarely resorted to by company unions. Management decisions are likely to be final and the employer may veto vitally important improvements proposed by employees.

Furthermore, should the members of a company union feel that a request which is vetoed is justification for a strike, they find themselves again at a disadvantage. Unlike members of trade unions they have no trained leaders experienced in conducting strikes and in maintaining the morale of strikers. While they are out of work they can get no strike benefits, which the powerful national unions can pay from their large treasuries or from assessments levied on their members in various parts of the country. Nor can they expect moral and financial support by making appeals to organized labor everywhere as any group of union workers may do. Strikes are almost bound to fail when conducted by company unions, because of the inherent defects of this type of organization.

Several suggestions have been advanced concerning the future of the company union. One possible development is a growth of independence and power of the company unions. Illustrative of this is the statement of the representatives of the Pennsylvania Railroad Company union. "General Atterbury has put something in the field which he would have a hard job to take out, and we have gotten so far that we say this—we dare him to take it out." If along with such a development the regular trade unions persist in their attitude of opposition to the company unions without making any of the changes in organization or policy which would seem necessary to win over their membership, the company organizations may aim at a separate movement, which would compete with the American Federation of Labor. It has been pointed out that the Christian, the Hirsch-Duncker and the Fascist unions compete with the regular trade unions in European countries. The direction of these unions did not come, however, as in the case of the company unions, from individual employers, nor is the policy followed of replacing trade union labor on strike.

Another possible development is the transformation of the company unions into trade unions. This may occur when the company union has been spineless, ineffective and compulsory and the workers have had a tradition of unionism and realign themselves with the trade union. It may come as a result of the type of strategy followed by the Amalgamated Clothing

Workers Union which converted A. E. Nash, who had instituted a "Golden Rule" company union in his Cincinnati clothing factory, even before winning over the workers themselves. The existing competition and antagonism between company unionism and trade unionism may be compromised on some such basis as that involved in the contract of the Mitten management of the Philadelphia Rapid Transit Workers and the Amalgamated Association of Street and Electrical Railway Employees, if that experiment is at all successful. According to this contract the firm agrees to drop a vigorous policy of opposition to collective bargaining with the trade unions if after a stated time the union has demonstrated its success in other centers and if—without opposition from the firm—a majority of the Philadelphia workers after an organization campaign express their desire for trade union organization.

The adoption of a broader social attitude of the type represented by the employee representation plans of the Dutchess Bleachery Company, the Dennison Manufacturing Company and others, together with a reconstruction and invigoration of trade unionism, may lead to a peaceful combination of the two now antagonistic forces. The basis of the combination of the two may be the inclusion in the employee representation plans of the trade union method of bargaining over wages and hours on a national scale with the aid of trained experts chosen by the workers themselves and, on the other hand, the adoption by trade unions of the shop committee methods of the company unions for handling the problems that are peculiar to each plant.

COMPARATIVE LAW may be divided into three branches: descriptive comparative law, comparative history of law and comparative legislation, or comparative jurisprudence.

Descriptive comparative law is the inventory of the systems of law of the past and present as a whole as well as of individual rules which these systems establish for the several categories of legal relations. Comparative studies of specific institutions of the law are naturally the most numerous. Modern law is described comparatively in manuals such as Lehr's; in comparative expositions such as Ernest Roguin's *Traité de droit civil comparé* (vols. i-vii, Paris 1904-12) and Franz Schlegelberger's *Rechtsvergleichendes Handwörterbuch für das Zivil- und Handelsrecht des In- und Auslandes* (vols. i-ii, Berlin 1927-29); in collections of codifications concerning a branch of law, such as Oskar Borchardt's *Die Handelsgesetze des Erdballs* (35 vols., 3rd ed. Berlin 1906-14; incomplete American ed. Boston 1911-15) and Karl Heinsheimer's *Die Zivilgesetze der Gegenwart* (vols. i, iii, vi- , Mannheim 1927-); and, above all, in the publications of the societies of comparative legislation. The most important of these societies, with the places and dates of their foundation and the titles and dates of first publication of their periodicals, which unless otherwise noted are still current, are as follows: Société de Législation Comparée (Paris 1863, *Bulletin* 1872- , and *Annuaire de législation étrangère* 1872-1927); Internationale Vereinigung für vergleichende Rechtswissenschaft und Volkswirtschaftslehre zu Berlin (Berlin 1894, *Jahrbuch* 1895-1914, *Blätter für vergleichende Rechtswissenschaft* . . . 1905-26). As indicated, these two publications were discontinued—the one at the time of the war, the other after the death of the president and founder, Felix Meyer. The association, reconstituted in 1927, is now represented by the *Zeitschrift für ausländisches und internationales Privatrecht* (1927-), which is the organ of the university institute of the same name and has absorbed the *Auslandsrecht* (Berlin 1919-26). There are the Society of Comparative Legislation (London 1896, *Journal* 1897, which in 1899 became the *Journal of Comparative Legislation and International Law*) and the Institut Belge

de Droit Comparé (Brussels 1908). The latter's *Revue trimestrielle*, after having published seven volumes up to 1914, was interrupted during the war but reappeared in 1922. There is also the Istituto di Studi Legislativi (Rome 1926, *Annuario di diritto comparato e di studi legislativi* Milan 1927-). This institute hopes to play in Italy the same roles which are played in France by the Société de Législation Comparée and the Société d'Études Législatives (Paris 1901). The latter, in its *Bulletin* (1902-), emphasizes comparative law as a tool in its work of stimulating legislative action. In many countries substitutes for societies of comparative legislation are to be found in boards or committees of information on foreign laws, organs of governmental departments, associations of jurists or business men or institutions having an autonomous existence, like the International Intermediary Institute at The Hague.

Comparative history of law is closely allied to ethnological jurisprudence, folklore, legal sociology and philosophy of law. It endeavors to bring out through the establishment of a universal history of law the rhythms or natural laws of the succession of social phenomena which direct the evolution of legal institutions. Its students have been up to the present principally interested in the reconstitution of the most obscure phases of the legal history of human societies. The two following periodicals will give a sufficient idea of the enormous bibliography of this branch of comparative law: *Zeitschrift für vergleichende Rechtswissenschaft*, founded by Bernhöft and Cohn, first appearing in 1878 and brought to full development under Joseph Kohler's direction from 1882 to 1916 and since then continued by Leonhard Adam; and *L'année sociologique* founded by Émile Durkheim in 1898, interrupted by the war, but recontinued in 1925 for the years 1923-24.

Comparative legislation, or comparative jurisprudence proper, represents the effort to define the common trunk on which present national doctrines of law are destined to graft themselves as a result both of the development of the study of law as a social science and of the awakening of an international legal consciousness. The functions and present activities of comparative legislation are far from being the same in the several fields of positive law. It has more easily taken root in the field of public than in that of private law, because of the association of constitutional, financial and industrial law with political science and financial and industrial eco-

nomics in the curricula of many universities. But in general this discipline works only toward scientific or technical education. Contrariwise, comparative criminal law, which at present constitutes the most vigorous branch of comparative law, aims at an interpenetration of the laws compared. A spirit of universalistic science has been given to penal law—above all to its general part—by the activity of the international anthropology and criminal sociology congresses which began in 1885; by international penitentiary congresses which were started in 1872; and above all by the Internationale kriminalistische Vereinigung (*Mitteilungen* 1880-), which was practically dissolved during the war and has only begun to function since 1926 in its German section; also by the Association Internationale de Droit Pénal (Paris 1924, *Revue internationale de droit pénal* 1924-), which held its first congress in Brussels in 1926 and has provided in its constitution for progress toward a universal penal law. This movement toward internationalization has been further accentuated by the penetration of criminology and penitentiary science into the teaching of penal law; by the simultaneous publication in a large number of countries of codifications of penal law taking as their point of departure the critical comparison of existing laws; and finally by the efforts made to graft an international criminal law on public international law, as in the work of Donnedieu de Vabre and Travers.

Some workers in the field of comparative law have detached themselves from the domain of private law to form the first experimental laboratories of comparative legislation dealing with such subjects as the law of patents, designs and trademarks on the one hand, and the law of copyrights on the other. The Bureau International de l'Union pour la Protection de la Propriété Industrielle (Berne 1883, *La propriété industrielle* 1885-) and the Bureau de l'Union Internationale pour la Protection des Oeuvres Littéraires et Artistiques (Berne 1886-87, *Le droit d'auteur* 1888-) are comparing the several laws on these subjects in preparation for the final coming of "uniform laws of justice and honesty." The beginnings of a uniform code can be traced in maritime commercial law, for which useful international accords have been made or prepared by the similar action of the International Maritime Committee, the International Law Association and diplomatic conferences. The same tendency can be traced in agricultural law, for which abundant documentation is

furnished by the Institut International d'Agriculture at Rome in its *Annuaire international de législation agricole* (1911-), and in labor law, which has been well equipped by the establishment of the International Organization of Labour in connection with the Treaty of Versailles. The need for the extension of this equipment to other fields of private law has given birth to the Académie Internationale de Droit Comparé (Geneva 1924, *Acta* 1928-) and to two organizations attached to the League of Nations: the legal section of the Institut International de Coopération Intellectuelle and the Institut International pour l'Unification du Droit Privé (1928).

Comparative law is still seeking its courses, and its students are not all searching in the same directions. 'This lack of harmony is due in part to a too frequent neglect of the necessity of distinguishing, where comparative jurisprudence is concerned, between the law of domestic relations and real property on the one hand and, on the other, the law of commercial relations. For the former, unification or reconciliation is neither desirable nor realizable. The comparative study of law is here reduced to an auxiliary discipline of legislative policy or to a complement of the theory of the conflict of laws. But as far as the law of contracts and obligations is concerned, in its application to commercial and industrial law, greater pressure exists against the obstacles placed in the way of international trade by the diversity of local regulations as a result of the economy of the capitalistic world.

Comparative jurisprudence has proceeded by adapting to the international sphere previously existing disciplines, which have made for the creation of the *droit commun coutumier* in France or the *deutsches Privatrecht* in Germany. A similar process of unification is to be seen in the evolution of the American common law, which has been drawn by university teaching from a general view of the forty-eight systems of law of the American federated states. The analytical school in England and the school of the *Allgemeine Rechtslehre* in Germany represent impulses which are strongly related to the growth of comparative jurisprudence; and going further back the *jus gentium* of the Romans and the universal striving for "natural law" may be mentioned.

However, the principal ancestor of comparative jurisprudence is Roman law in the modernized form which the glossators, post-glossators and humanists have given it. By a process of re-

ception, the intensity of which varied with different chapters of the law and in different regions, this Roman law gave continental Europe the benefits of a relative community of law for centuries. Its power as positive law has been progressively destroyed by the nineteenth century codifications except perhaps in South Africa. Yet it is still the instrument of scientific liaison between Latin and German law. England, on the contrary, resisting the attraction of Roman law has constituted an original corps of law which colonization has made the common law of the English speaking peoples. The task of comparative jurisprudence is to remedy the situation arising from the coexistence of these two bodies of common law by bringing back at least to the commercial law of the capitalistic world the spirit of humanism with which the doctrines of the civilians were formerly inspired. Thering had already assigned this role to comparative law, but his appeal was not heard until the beginning of the twentieth century under the influence of Raymond Saleilles, and no practical advances were made until the Treaty of Versailles created the necessary international point of view.

The rudimentary but perfectible instruments of action which comparative jurisprudence has at its disposal at present may be enumerated as follows: (1) organs of legislative action (a) in international treaties, (b) in uniform laws, such as those adopted in various European countries and in the American states, dealing principally with various branches of commercial law (the Instituto-Luso-Hispano-Americano has advocated the adoption of uniform laws in Latin countries and the *Revue juridique internationale de la locomotion aérienne*, Paris 1910-28, sponsored uniform laws in its field), (c) in international collections of statutes such as the *Legislative Series* of the International Labour Office (London 1919-); (2) organs of judicial action: in the beginnings of international law reporting, as in the *Revue de droit maritime comparé* (Paris 1923-) and *International Survey of Legal Decisions on Labour Law* (Geneva 1926-); (3) organs of action on trade practises: as represented by the York-Antwerp rules, and such collections as Ishizaki's *Le droit corporatif international de la vente de soies* (3 vols., Paris 1928); (4) organs for teaching. Comparative legislation is represented in all the French universities by chairs or courses which are optional to students and in Portugal by similar courses which are obligatory; in Germany only—save in

rare instances—by seminars, where it is often connected with private international law. University institutes of comparative law are increasing in civil law countries: in Lyons (Séminaire oriental, 1906, *Travaux* 1913-; Institut de Droit Comparé, 1921, Bibliothèque, *Études et documents* 1922-28, with a *Série de criminologie et de droit pénal comparé* 1929-; in Paris (Salle de Travail, *Collection d'études théoriques et pratiques de droit* . . . , ed. by Henri Lévy-Ullmann, 24 vols., 1923-30); in Strasbourg; in Toulouse (collections of constitutional and Latin civil law); in Berlin (the Institut für Ausländisches und Internationales Privatrecht, under the direction of Ernest Rabel and Viktor Bruns, *Zeitschrift*, *supra*); in Munich and Heidelberg; in Breslau (studies in eastern European law); in Hamburg (studies in Ibero-American); in Oslo (the work of Professor Fredrik Stang); and institutes are in formation in Italy, Argentina and other countries.

Common law countries have been slower to experiment. In England the first fruitful attempts have been made at the London School of Economics rather than at the older universities. In America the adaptation of the English common law to native conditions has itself represented a form of comparative jurisprudence, and a growing interest is now manifested in the field. In general, comparative law will have most difficulty in forcing entry where law teaching is not presented in a framework of economics and political science; for comparative jurisprudence and law as a social science are two aspects of the same thing.

COMPARATIVE PSYCHOLOGY. Logically and practically, comparative psychology should denote the study of mind, its conditions, expressions and relations, by means of the method of comparison. Actually, the term is synonymous with animal psychology, which as it happens is mainly the study of behavior. But whatever the accident of usage the linking of "comparative" with "psychology" has long implied scientific study of the growth or development of mind and its behavioral patterns in the individual organism and their evolution in the race. Indeed, genetic description or the history of mind is quite as distinctive of comparative psychology as is its special method, and since the achievement of such description necessitates the use of all materials of ontogeny and phylogeny comparative psychology is inclusive of the greater part of human psychology as well as of that of all other organisms. Only to the extent that it is the science of experience (the psychology of the self) is human psychology sharply separated from comparative psychology. The two contrast significantly in that comparative psychology has always tended to be more highly objective, to concern itself especially with problems of genesis and development and to constitute, historically at least, a bridge between general biological science and introspective psychology.

More intimately than the general science of psychology comparative psychology is associated with the comparative disciplines of zoology,

anatomy, physiology, pathology and sociology. From these subjects it constantly borrows facts and methods. Its origin traces to natural history—historically the naturalistic uncontrolled observation of animal life. Evolutionary hypothesis at various times has extended and intensified interest in comparative psychology and finally, following the publication of Darwin's views, focused it on mental evolution. During the latter half of the nineteenth century naturalistic observation of the senses, instincts and habits of organisms was gradually supplemented by the introduction of experimental method with its development of special techniques for the analysis of behavior and control of conditions of observation. By the end of the century the experimentalizing of comparative psychology had progressed conspicuously. The movement was especially vigorous and influential in America, where as contribution to animal behavior, animal psychology, genetic psychology and comparative psychology a large amount of important observational and theoretical work has been reported.

Notable in the history of comparative psychology are invention and refinement of methods of observation, perfecting of observational controls, increase in accuracy and completeness of description, and extension of influence. Both methodologically and factually the subject has exerted significant influence on the general science of psychology and its technologies and on education and the social sciences. Evidently the remarkable development and persistence of the experimental movement in the comparative study of mind and behavior are due chiefly to the robust objectivism and methodological resourcefulness of investigators. Uncontrolled naturalistic observation, anecdotal description, anthropomorphism and careless interpretation have been gradually replaced by careful, critical inquiry, increasingly objective description and eminently fruitful speculation.

Necessarily objective, because the method of introspection is applicable only in the study of the psychology of the self, comparative psychology more than most other branches of the science has tended to study the organism as a whole. Thus with the aid of other sciences it has achieved knowledge of interrelations of structural, functional and experiential phenomena. Much of its work may properly be designated as psychobiological. Illustrative of lines of inquiry which have been fruitfully developed are the following. For convenience of description the

three major categories, receptivity, affectivity and adaptivity, are employed.

Studies of receptivity (sensory phenomena) are numerous and conspicuously important. They include: discovery and analysis of general and specialized modes of qualities and sense, their characteristics, relations and values; interrelation of sensory and other phenomena and association of processes of reception with those of response. It is through receptive capacity that the organism maintains contact with its environment. Many aspects of the problems within this category have been investigated in a wide range of organic types, often with special attention to adaptation, ontogeny, phylogeny, variability, thresholds, norms, abnormal deviations, modifiability and educability. The phylogenesis of vision, and more recently of color vision, has interested many investigators. The layman is as a rule surprised to learn that whereas monkeys and apes apparently possess color vision similar to that of man dogs and cats are either color blind or possess color sensitiveness radically different from our own.

In the field of affective phenomena studies are less numerous than in that of receptivity. Observation and analysis of affective experience and behavior in many types of organism have been attempted. Feelings, emotions, sentiments and their behavioral correlates are recognized as worthy of experimental study, but techniques for this purpose are less satisfactory than in the case of receptivity and of adaptivity. Even the present terminology for affective phenomena is obviously inadequate. The term *fear*, for example, denotes an experience or a bodily picture, either or both. While the student of human psychology has studied especially the experience, the comparative psychologist has endeavored to observe, so far as practicable to measure, and thus to obtain accurate description of the bodily picture. Temperament, which possibly is primarily affective in its constitution, seems more likely to be serviceably analyzed, measured with respect to its constituent processes, described genetically and ultimately modified and controlled through and by means of the efforts of the comparative psychologist than otherwise. It is recognized especially by social scientists that there are various reasons for looking to comparative psychology and psychobiology for experimental conquest of affective experience and behavior and for the achievement of diagnostically valuable measurements and of a degree of experimental control of the specific

phenomena which will place affectivity, as represented for example in temperament, no less definitely within the sphere of human engineering than are now phenomena of receptivity and adaptivity (intelligence).

Studies in adaptivity are mentioned last because they most obviously and conspicuously command attention. Whereas a generation ago instinct and habit were being studied comparatively as sharply contrasted tendencies in animal life, today there is substituted for both the concept of behavioral adaptivity. Knowledge is sought of types, characteristics, external and internal conditions, relations and values of the processes of learning, habit formation and modifiability, all of which are forms of behavioral adaptation. Through numerous scientifically admirable experimental studies of adaptivity comparative psychology has greatly extended and perfected knowledge of the processes involved and of the nature and relations of the hereditary basis of action (formerly called instinct) and of those developments and modifications of structure which condition the appearance of distinctively individualized patterns of behavior. Research has largely emancipated the comparative psychologist from the *ex cathedra* pronouncement that certain behavior patterns are inherited and certain others acquired individually. It has been demonstrated that certain structural conditions are inherited and that from and upon these develop structures and reactive capacities which finally gain expression in more or less definitely, complexly and permanently adapted activities. Adaptivity is therefore exhibited by current work in comparative psychology as a fundamentally significant category and concept. Modern studies of instinct and habit tend more and more intimately to involve and engage the materials and techniques of experimental zoology and structural and functional neurology as well as of psychobiology.

Of theoretical positions the teleological and the mechanistic (see MECHANISM and VITALISM) appear in comparative psychology as in all science. That they are other than expressions of temperamental differences among investigators has not been proved. Extremists are not lacking, but the majority of comparative psychologists appear to be pragmatic in their objectivism and to harbor the hope, if not also the belief, that their division of biological science is more likely to be advanced than retarded by open mindedness, breadth of view, freedom from dogmatism and willingness to try all methods and all points

of view. Few of them have denied or are prepared to deny that mind may be an aspect of activity or at least of organic activity. As a rule they strive disinterestedly for reliable genetic description of mind and its expressions in behavior and thus for a better understanding of life.

COMPARATIVE RELIGION. Although religions have actually been compared for more than two thousand years, comparative religion as a scientific discipline is modern, having its point of origin in the study of religious data by scholars in the second half of the nineteenth century. Made on the pattern of comparative philology and comparative mythology, the term comparative religion has always been awkward and unsatisfactory. It may be regarded as synonymous with the science of religion, *science des religions*, *Religionswissenschaft*, and inclusive of *les sciences religieuses*. The generally accepted divisions of the study are history of religions, psychology of religion and philosophy of religion, corresponding with Goblet d'Alviella's classification of hierography, hierology, hierosophy, although L. H. Jordan among others has steadily advocated a further division to be devoted to comparison of religions (see Third International Congress for the History of Religions, *Transactions*, Oxford 1908, vol. ii, p. 365-452).

From the time of the mingling of religions in the Greco-Roman world thinkers have been forced to evaluate their own religion in relation to others. Scores of theories have been advanced for the reconciliation of religions, theories as to the nature of religion, laws of religious development and interpretations of religious origins.

The professedly scientific theories of modern scholars in the field of religious origins were often anticipated by those of earlier thinkers: for example, the worship of the souls of dead heroes advanced by Euhemerus (c. 300 B.C.); fetishism and astrolatry, by C. De Brosses (1709-77); satisfaction of human needs, by A. Court de Gébelin (1725-84); animism, by N. S. Bergier (1718-90); astrolatry, by C. F. Dupuis (1742-1809); fetishism, deified men and astrolatry, by C. Meiners (1747-1810); and the sense of wonder and mystery, by C. G. Heyne (1729-1812). A note which runs consistently through all these centuries is the steady assumption of the supreme status and transcendent worth of Judaism and Christianity. All work on religions therefore resolved itself into apologetics. Conditions were not ripe for the development of religious sciences until toward the close of the nineteenth century. Then several factors converged to make possible a more objective approach to religious materials. After many false starts there developed a historical and critical spirit best represented in the mid-century by K. O. Müller in his *Prolegomena zu einer wissenschaftlichen Mythologie* (Göttingen 1825). Then, also for the first time, there was made available in adequate mass of reliable materials relative to many religions which had been collected by European conquerors, travelers and missionaries. The conflicting and discordant attempts to interpret these religions made more than ever apparent the necessity of finding a method free from bias and *a priori* reasoning. At the same time the achievements of the new science of comparative philology, followed by the first flights of comparative mythology, turned the philologists to the study of the religions revealed in the newly discovered sacred books of the Orient. A still greater stimulus was the theory of biological evolution, which encouraged anthropologists and students of society to seek a law of evolution in the religious history of man. Outstanding investigators in theology, history and the sciences were attracted by these developments and undertook to put the history of religions on a scientific basis; a new objective attitude and an effort to escape the hampering hand of apologetics became signs of the new trend.

The new science found an eager welcome. University departments were given over to it and before the close of the century there were chairs for the study of religion in Holland, Switzerland, France, Italy, Denmark, Belgium

and America. The science rapidly acquired special lectureship foundations, its own journals, museums, textbooks and international congresses. Although freed from the shackles of apologetics, it soon became clear, however, that comparative religion could not remain a discipline circumscribed within definite boundaries, for its development as a science depended upon research in all phases of the history of man. Specialists in all the sciences which deal with human culture have during the last century been its builders, and the great names which mark the stages of its development are also the important names in the various social sciences.

The exploitation of the rich heritage of materials and tools of research furnished by earlier scholars was undertaken by no less than six distinct groups, each with its own special interest. The chief figure of the philological school was Max Müller (1823-1900), who had made a brilliant application of comparative philology to the study of mythology and who now turned to the interpretation of religion in the opening lectures of the Hibbert Foundation (*The Origin and Growth of Religion as Illustrated by the Religions of India*, London 1879) and of the Gifford Foundation (*Natural Religion*, London 1889; *Physical Religion*, London 1891; *Anthropological Religion*, London 1892; and *Theosophy: or, Psychological Religion*, London 1893). The anthropological school, which was interested chiefly in primitive religions, had as its outstanding figures before the opening of the century E. B. Tylor (1832-1917), J. G. Frazer (1854-) and A. Lang (1844-1912). The method of both of these groups was comparative and psychological. Not to be classified in any school but of great influence was Herbert Spencer, who began his *Principles of Sociology* (3 vols., London 1877-96) with a treatment of religious origins. In France in the closing decades of the century Émile Durkheim (1858-1917) announced a new objective sociological method, while earlier in Germany M. Lazarus (1824-1903) and C. Steinthal (1823-99), later joined by W. M. Wundt (1832-1920), had established the school of *Völkerpsychologie*. In addition to these influences there were scholars like Albert Réville (1826-1906), Jean Réville (1855-1908), Conrad von Orelli (1846-1912), Chantepie de la Saussaye (1848-1920), Maurice Vernes (1845-1923), C. P. Tiele (1830-1902) and many specialists in the realm of a single religion, who continued the tradition of the historical school. Finally, there were the theologians and anthropol-

ogists who continued to write histories of religions and comparative religion colored with overt or disguised apologetics. The story of the last half century of development is thus largely a record of slow emancipation from presuppositions and the refinement of methods on the part of all groups, with a gradual realization of the necessary synthesis of the sciences in the interpretation of the constantly changing social process of which religion is a function.

The escape from unconscious biases which are part of the intellectual climate in which scholars live has also been a slow process. Experience indicates that the attainment of a purely objective approach to the materials of religion is especially difficult. Although scholars early and easily abandoned the concept of primitive revelation, a species of revelation theory continued to hold the ground for decades. Theological dogma was likewise discredited, but the continuation of its fundamentals in the religious philosophies of G. W. F. Hegel, F. E. D. Schleiermacher, Immanuel Kant and A. B. Ritschl shaped the world view of many scientific workers and colored their interpretation of the facts of religions. Only in the last decade have theological ideas and concepts of the supernatural, regarded as functions of social groups, been brought completely within the control of the religious sciences. The science of religion has not even yet outgrown fully such concepts as a "faculty of faith," the psychological unity of mankind, religious sentiment, religious instinct and religious consciousness. A third bias and a much more serious one was the presupposition that a unilinear law of evolution might be discovered in the social realm and therefore also in the development of religion. Herbert Spencer, Max Müller, Émile Durkheim and the early anthropologists shaped their materials in terms of this hypothesis. The general titles of the Hibbert lectures also indicate this interest. Reckless use of the comparative method did make possible the arrangement of the materials of the religions of preliterate peoples into a plausible scheme of evolution, but inability to find agreement regarding origins and conflicting reconstructions of the supposed law of development led to the chastening of the method and removal of its influence from the field. A more persistent bias—the identification of religion with ideas of the supernatural and attitudes toward it—was the result of the peculiar nature of Christianity as a religion. Indeed, when the long search for religious origins is

examined it often turns out to be only a search for the earliest and simplest idea of the supernatural. The controversy over magic and religion was made possible only because religion had by definition been identified with man's relation to divine beings. This long logomachy ended in the discovery that so-called magic is simply an irrational, emotionally created technique and hence, unless a distinction is arbitrarily read into the two terms, inseparable from other phases of the religious complex. When the idea of a progressive evolution from the simple to the more complex and the idea of religion as *belief* in the supernatural were ultimately removed, the religious sciences were able to see religions in their manifold varieties as behavior patterns of groups in search of the necessary values in life. The drive of human desires for physical and social satisfactions thereafter took the central place in the study of religion, while ideology, cult and the specific values of the ideal could be clearly seen as relative to and shaped by the environmental situations of the group existence.

When this life process, moving through changing social human situations in relation to a natural environment, was accepted as the creator of the elements of the religious complex, the method of the religious sciences became clear. The interpretation of a religion must depend upon an adequate description of these changing situations. Then idea, ideal and cult technique will be naturally oriented in their setting as functions of group life. To attain that adequate description is the task of the science, and its fulfillment requires the collaboration of all the social sciences and their specific methods. For materials, instruments of research and refinement of method the religious sciences depend upon prehistory, archaeology, geography, physical anthropology, ethnology, psychology, history, philology, sociology, social psychology and the criticism of documentary data and all the other social sciences which interpret economic, legal and institutional materials. Probably the great interpretative works of the future in the science of religion will be works of collaboration by groups of specialized scholars familiar with the materials and methods of these various sciences.

COMPAYRÉ, GABRIEL (1843-1913), French educational administrator and author. Compayré was professor of philosophy at Toulouse, inspector general of public instruction and a member of the Academy of Moral and Political Sciences. He published many books on the history and science of education, translations of Locke, Sulley, Huxley, and pamphlets on J. J. Rousseau, H. Spencer, Pestalozzi, J. Macé, Condorcet, Herbart, F. Pécaut, Montaigne, Dénia, Horace Mann, le Père Girard, Fénelon and Froebel. In 1909 he became director of *L'éducateur moderne*, an educational review.

Compayré was not only a popularizer of pedagogy but a scientific pedagogue; although he had no pedagogical system of his own he understood and explained all systems. He was the first in France to base pedagogy upon psychology, especially child psychology, which he tried to build up experimentally. His *L'évolution intellectuelle et morale de l'enfant* (Paris 1893, 6th ed. 1913; tr. by M. E. Wilson in International Education series, vols. xxxv, liii, New York 1902-09) is based on observations of his own children concerning senses, memory, imagination, instincts, imitation, curiosity, judging and reasoning, language, plays. His *L'adolescence: études de psychologie et de pédagogie* (Paris 1909, 2nd ed. 1910) introduced to France by means of an exhaustive and sympathetic review the work of G. Stanley Hall. While some of his work is

obsolete his book is still of use, and his conception of pedagogical science as independent of general philosophy was wholly new in its time and place. He gave scientific pedagogy a pre-eminent place in normal school training, in universities and in educational councils and was chiefly responsible for the development in France of pedagogical science.

COMPENSATED DOLLAR. The compensated dollar proposal is one of several plans which have been suggested to cure the evils of inflation and deflation. The object of these plans is to control money and credit with a view to maintaining an approximately steady general level of prices. This does not mean the control of individual prices or "price fixing." The general level of prices can be maintained while individual prices are perfectly free to move, just as the waves of the sea are free to move up and down relatively to the general sea level.

It is only since the World War that the idea of a monetary unit stabilized in purchasing power has attracted any widespread attention. Although there had been many similar schemes for varying the gold content of the dollar proposed by earlier writers, the compensated dollar proposal was most fully set forth by Fisher (*Stabilizing the Dollar*). As a result of the new interest in the problem the plan has been widely discussed and embodied in several bills which have been laid before Congress.

The chief characteristics of the compensated dollar plan may be briefly summarized. First, upon its adoption all gold coins would be dispensed with and replaced by gold certificates. These would not, like the present gold certificates, entitle the holder to a fixed quantity of gold, but would entitle him to a fixed value of gold.

Second, the weight of gold which would have this fixed value, i.e. would purchase the same market basket full of goods, would vary from time to time and would be determined in accordance with an index number of commodity prices. If, for instance, the commodity price index should rise to 102, that is, 2 percent above the par agreed upon, the gold content of the dollar would be increased by 2 percent. If the index should decline to 97 the gold content of

Comparative Religion—Compensation and Liability Insurance 135

the dollar would be reduced by 3 percent. In other words, the price of gold at the United States Mint, instead of remaining immutably and artificially fixed as it has been since 1837 at the figure of \$20.67 an ounce, would vary from time to time just as the price of silver or any other commodity varies according to market conditions.

Third, in order to keep a 100 percent reserve behind the gold certificates so that they would be fully covered like the present gold certificates, any decrease in the value of the covering gold would require that the government buy more gold with gold certificates to make up the deficiency. Conversely, if gold should increase in value additional gold certificates would be issued.

Fourth, the equivalent of the present free coinage of gold would be retained. The right to deposit gold in exchange for certificates and likewise the right to redeem certificates in gold would have the same effect as free coinage has today. Free coinage would then mean, as practically it does mean today, not the actual coinage of gold but the unlimited purchase of gold by the government at the price set. The government would pay for gold with certificates just as it does today. The difference would be that the price of gold under the compensated dollar plan would vary in accordance with the variations in the official index number. Conversely, the government would redeem gold certificates, just as it does today, in gold at the market weight per dollar, in whatever amounts and whenever presented. The difference in redemption would be that under the new plan the amount of gold paid out to redeem each dollar would vary from time to time.

Fifth, there would be imposed a small brassage fee of, say, one percent. That is, the government would charge one percent more for gold than it would pay for it. The object of this charge would be not to remunerate the government for its services in operating the system but to prevent speculation in gold at the government's expense. Such speculation might otherwise occur if, for instance, gold could be bought on one day at \$20.50 an ounce in the open market and it were known that it could be sold back to the government the next day at \$20.80. This brassage fee of one percent, coupled with the restriction that on no one date would the government change the price by more than one percent, would suffice to prevent speculation injurious to the government. Any speculation

which might remain would be merely in anticipation of expected price changes, would be beneficial rather than otherwise and would not be at the expense of the government exchequer.

From the standpoint of actual cost of operation the compensated dollar plan is far superior to any other plan for stabilization which still maintains gold as the basis of redemption. If the gold standard were to be given up, an entirely different and simpler system could be substituted, such as that proposed by Professor Gilbert Lewis of the University of California, who would have certificates virtually, although not literally, redeemable in composites of commodities. The "managed currency" of Professor John Maynard Keynes is another proposal for achieving the value standardization of the money unit. He proposes to reject gold as a dangerously harmful monetary standard and to substitute paper credit currency in its stead. In his scheme also the amount of the currency issued would be determined by index numbers.

W., "The Plan for a Compensated Dollar" in Quarterly Journal of Economics, vol. xxvii (1912-13) 401-16.

COMPENSATION AND LIABILITY INSURANCE. The purpose of liability or third party insurance, including workmen's compensation insurance, is to indemnify the insured for damage to the persons or property of others for which he has been held legally liable. Although frequently written in the same form, insurance against the hazards of injury to the persons of third parties and to the property of third parties represents entirely separate covers and separately calculated premiums. The third parties suffering personal injuries may be employees or members of the public. For actions arising out of industrial injuries to employees employers' liability and workmen's compensation policies are used, while claims by the public are covered by one of the numerous so-called public liability insurances. For damage suits originating from injuries to the property of third parties parallel property damage policies have been devised where there is a hazard.

The development of liability insurance has been conditioned by the increasing employment of practises involving danger of injury to third parties and by the changes in the law governing liability. Until the last quarter of the nineteenth century the law in all countries held a person liable for injuries caused by his own acts of commission or omission or (except in England and the United States) those of his agents, wards and servants, if it could be proved that this person did not exercise a reasonable amount of prudence and care, where law was based on *de facto* responsibility for ownership or control (e. g. Prussian act of 1838). The mere occurrence of injury caused by ownership or control created liability. On the continent liability was linked to negligence by the doctrines of civil law, and in English speaking countries by common law as interpreted by the courts. In the latter the liability for injuries to employees as such was for a long time non-existent. The courts held the employer blameless if it could be shown that the injury was the result of an act of another workman or was a usual risk of occupation or was due in however small a part to some action of the injured party. Any of these defenses of the employer was sufficient to defeat a suit for damages except in a very few cases. It was not until 1880 that the Employers' Liability Act was passed in England which invalidated to some extent the "fellow servant" defense of the employer and for the first time penetrated the almost complete immunity of the master in industrial accident suits. Soon thereafter the American states entered upon a period, which was to last for a quarter of a century, of employers' liability legislation attempting to restrict the scope of employers' defenses. The injured worker could now hope for a measure of relief in the courts, and although his case was weak according to modern standards it created a new hazard for his employer, who called for insurance protection. The first company, the Employers' Liability Assurance Corporation, began business in England in 1880; in 1886 it also wrote the first employers' liability policy issued in the United States. The first American company was the Travelers of Hartford founded in 1889.

Despite the modifications of employers' defenses introduced by employers' liability enactments very little improvement was effected in the condition of the employee. For the essential feature of a negligence system is that liability

must be tested and proved in a court of law, and no matter how broad minded its administration no court can overcome the handicap of a code of rules originated centuries before the factory system. Most injured workers received no indemnity at all. Those few who were successful were compensated months and even years after their injury. A remedy was sought in substituting the principle of compensation for that of liability for negligence. The principle of compensation is based on the assumption that the complexity of the modern industrial structure makes it a practical impossibility to allocate blame for an industrial injury. It goes much further than the mere statement that it is unjust for the employer to leave to his employees the burden of meeting the industrial injury hazard; it postulates that industrial injury is an occupational risk and as such is one of the costs of production which like all other costs must be borne by the final consumer of the product. The employer is made responsible not for the occurrence of the injuries but merely for collecting from the group the cost of paying for them. As soon as an industrial injury as defined in the appropriate statute takes place it is compensated by the employer or the insurer to whom he has transferred his liability. The defenses of the "fellow servant" and the "assumption of risk" rules are entirely gone, and that of contributory negligence is almost entirely gone. The first English compensation law was enacted in 1897 and the scope of its operation was materially extended in 1900 and 1906; it was revised again in 1923. The first effective American compensation statute dates from 1911, and since then all but four American states (Arkansas, Florida, Mississippi and South Carolina) have enacted compensation legislation.

Generally speaking, on the continent of Europe liability for industrial injuries was from the beginning of the nineteenth century governed by the doctrine of negligence of the civil law, which did not differentiate between employees and members of the public and consequently did not offer the defense of the "fellow servant" rule. The risk borne by the employer was therefore greater than in English common law countries and at an earlier date he sought to protect himself by taking out collective insurance for his workmen with a private company or by insuring himself in a state fund, as in France, or by making contributions to workmen's benefit organizations, as in Prussia. With

the spread of industrialism the principle of compensation was eventually substituted for that of liability. The steps in this development were the shifting of the burden of proof in industrial injury cases to employers, the development of the concepts of occupational risk and the extension of the compensation principle from a few hazardous trades to a great majority of industrial occupations. Beginning with Germany in 1884 European and South American states enacted general workmen's compensation laws; in some cases these statutes were merely an extension of liability legislation which heretofore applied only to railways, shipping and mining. This process received an additional impetus from the trend toward social insurance in the post-war period, so that at present virtually every country of occidental civilization has some amount of compensation legislation.

Compensation laws created a new hazard for the employer and made insurance protection imperative for all but the very large concerns and for industries in which the occupational risk is extremely small. Since compensation laws are enacted for the benefit of the workmen and payments may extend for as long as a generation after the occurrence of the accident, insurance protection is essential in carrying out the purposes of the legislation. Compensation statutes in practice, however, do not always connote compensation insurance. Thus the English take the extreme position of permitting the employer to remain uninsured, although in fact a majority pool their risks in mutual employers' associations or insure with private carriers. In France workmen's compensation insurance is also optional, but the payment of compensation is safeguarded by a state guaranty fund supported by taxation of non-insured employers. On the other hand, where compensation is an integral part of a more comprehensive program of social insurance, compensation insurance with a specified insurer is likely to be compulsory. In Germany, for example, every employer must insure his accident risk in a mutual employers' association; in addition both employers and employees must contribute to sick benefit funds, which cover incidental disability from industrial accidents. Although the German system is highly autonomous in administration, the insurance funds are closely supervised by the state. Seven American states which compel insurance with a state fund (although two of these permit self-insurance) offer an example of still another form of compulsory insurance.

In other American jurisdictions the general rule is that the employer must either insure or satisfy the state that he is able financially to bear the risk himself.

Self-insurance may under certain conditions be almost as satisfactory as insurance with a carrier. If the establishment fund of a large concern were carefully segregated from its other assets, managed as an independent entity and efficiently supervised by public authority it would be as safe as any other insurance fund. But even in such circumstances the fact that compensation is paid directly by the employer is likely to intimidate the employee into accepting less than his just due. In too many cases self-insurance means only that the employer is relieved from making insurance premium payments and pays benefits as long as his assets warrant. A disgraceful blot on the American compensation record is the frequency with which the victims of accidents, especially of a catastrophic character, receive little or nothing because the employing corporation is insolvent and passes out of the picture.

Where the American employer insures his compensation risk with a private carrier he may choose between the stock company, the mutual company and the reciprocal exchange. The stock company, a profit making enterprise, relies for its business upon a system of agencies which in many cases extends to every part of the country. It promises to the employer a fixed cost of covering the compensation risk and the superior service of its widespread organization. Legally the mutual insurance company represents an association of persons or corporations who have combined their compensation risks. Mutual companies differ, however, from many mutual associations of employers found in European countries in that most of them are, like stock companies, operated by a corps of specialists; generally the members of the mutual are no closer to the details of the business than are the customers of the stock carrier. Mutuals do not maintain an expensive agency system, and they refund profits to their members in the form of dividends. The so-called reciprocal or interinsurance exchange is a variety of mutual. In legal form it is an association of persons each of whom agrees to indemnify every other member severally and not jointly. Each member maintains a separate deposit which corresponds to a premium in an insurance company and constitutes the base of the entire interinsurance structure. The size of the deposit determines

the proportion in which each member is charged upon occurrence of loss and the liability of each member for debt. The affairs of the exchange are in the hands of a manager or attorney-in-fact, who is paid a certain percentage of the deposits. The reciprocals insist that legally they are not insurance corporations and that their organization makes them immune from all insurance legislation as such. Their exact legal status is almost entirely undetermined, and the legislation which governs them is totally special and inadequate. Also in ten American states and some foreign countries the employer may (and in seven American states must) insure his risk with a state fund which is actually a mutual company administered by government appointees.

The comparative importance of these carriers in the United States at the present time may be measured by the distribution of premium income among them: the stock company still obtains 60 percent, although it is faced with ever keener competition; the share of the mutual company is about 20 percent and that of the state fund, including the exclusive funds, runs consistently between 16 and 17 percent; the reciprocal exchange wrote about 6 percent of the business in 1923 but its share had declined by 1929 to about 3 percent.

A scientific comparison of insurance carriers would involve three elements: cost of insurance to employers and of administration of compensation to the state, security to both employers and beneficiaries and the standard of service maintained in promptness and adequacy of compensation payments and in accident prevention work. Such comparison is, however, difficult; the carriers differ from each other in the type of business done and comprehensive data on all these questions are not available. As compared with the mutual the stock company claims superior security because of its broader base of operations, and in American practise it has been outstanding in efforts toward industrial accident prevention. It is to be observed, however, that there have been failures among stock companies and that their expense ratio is about twice as high as that of the mutuals. On the other hand, the lower costs of the mutuals are due not merely to the fact that they have eliminated the agency system but also to the fact that as a class they write larger risks which tend to produce lower loss and expense costs. The reciprocal exchange operating on the assessment plan is not in a position

to offer the advantage of fixed cost to its members, unless it reinsures or severely limits its members' liability; moreover, if it can limit the liability of its members for debts to third parties (a privilege recognized in one state), the reciprocal as a type of insurance carrier does not maintain an adequate standard of security for compensation beneficiaries. Apart from public subsidies sometimes received, the expenses of a properly administered state fund should not be lower than those of a mutual company, nor is the security of payments by it superior, except morally, perhaps, to that of an efficiently managed private carrier. As a public agency it cannot select its risks, and in the case of certain industries with a high injury hazard it is often the only carrier willing to insure. Theoretically a state fund does not have as much inducement as a private carrier to engage in "short changing" settlements with victims of industrial accidents and to delay the payment of compensation by prolonged litigation. In fact, one of the conclusions of the investigation carried out by the United States Bureau of Labor Statistics covering the period from 1917 to 1919 was that "state funds are more liberal in settling claims and appeal fewer cases to the commissions or courts" (*Bulletin*, no. 301, 1922, p. 4). Other equally authoritative students of the question, however, point to the fact that for political reasons the personnel of the state insurance fund is often mediocre and that appropriations to maintain it are often cut down to a point where efficiency is hampered. Moreover, it is alleged that employees of the state fund sometimes consider themselves trustees for the insuring employers rather than for the injured employees and resort to the same practises of paring down claims as do the less scrupulous private carriers. This is particularly detrimental to the interests of employees when the settlement of claims is in the same hands as those which manage the state fund.

As compared with self-insurance and competitive insurance carriers monopolistic insurers have a great many theoretical advantages. They enjoy considerable economies in the cost of operation: their selling costs are wholly eliminated and smaller savings are effected in policy issuance, claims adjustment and plant inspection. In the matter of security of payments to beneficiaries they have the undoubted advantage of unlimited power of assessment upon the insureds and of a base of operation usually sufficiently broad to yield a premium income of

safe magnitude. Where the monopoly is vested in a public insurance fund separated from the administration of claims settlement, the monopolistic insurer should have a better record than a competitive insurer in the prompt and equitable adjustment of claims. These are the considerations which underlie the agitation in the United States for compulsory insurance with a state fund, espoused by organized labor and the American Association for Labor Legislation. The American experience with exclusive state funds, however, has not been as satisfactory as theoretical considerations would lead one to expect—particularly on the score of promptness and liberality of payments and initiative in undertaking accident prevention work.

In most American states employers' liability and workmen's compensation insurance are combined in one policy. The reason for this is that compensation nowhere applies to all industrial injuries: not all intrastate occupations are covered, interstate and foreign commerce are entirely left out, and under the so-called elective laws either employer or employee may elect not to come under the compensation law. Victims of industrial injuries not protected by the compensation law may sue and obtain relief under provisions governing employers' liability. The contract in general use is known as the Standard Workmen's Compensation and Employers' Liability Policy. It is required in many states and is used everywhere by the companies in order to secure uniformity. The principal clauses of the policy contain the promises of the company to inspect the insured premises, investigate reported accidents, defend suits and settle claims. Every part of the compensation law, whether mentioned in the policy or not, is in fact a part of the policy and governs its interpretation. The policy period is always one year, because of rapidly changing conditions that affect risk and premium. There is no policy face or limit; in every respect the company stands in the place of the employer.

Rate making in compensation insurance must be based on an adequate system of risk classification; otherwise the losses of one industry will be paid by another or, where a company carries other lines, by an altogether different group of insureds. A risk class or classification may be an entire industry, as cast iron pipe manufacturing; or an occupation, as carpentry; or a process, as blasting. In a classification are placed the loss and pay roll data for all insured risks and the average loss cost or pure premium

ascertained. The risk classification must be broad enough to develop a dependable experience for rate making; it must be homogeneous in respect to physical hazard in order to yield a true rate; and it must coincide as far as possible with the actual divisions found in industry in order to eliminate a multiplicity of rates for a single plant. The requirement of homogeneity, then, conflicts with that of following the lines of industrial division and even more so with the requirement of sufficient volume of data. The rate maker may not simply pile up loss and pay roll data by adding the experience of the years cumulatively, for rates of accident frequency and severity change, wage levels rise or fall, the compensation laws themselves are revised and their administration is consistently liberalized. Some of the changes which invalidate uncorrected data, such as the effect of an amendment to the schedule of benefits, may be exactly measured; others, such as changes in wage level, are so tenuous that the actuaries no longer attempt to take them into consideration. At the same time, the data cannot be confined to the very recent past because what would be gained in homogeneity would be lost in volume. Again, territorial differences hamper the rate maker when he attempts to add to his data by using nation wide experience. Every state has its own compensation law; liberality of administration varies between the states; accident rates are not the same; wages are pitched at different levels. In order to be comparable and susceptible of combination data must be adjusted. These adjustment and correction factors and procedures, no matter how carefully conceived and executed, are nevertheless artificial and capable of error.

After years of attempting to pitch rates at precisely the correct level and to project rates made today into the future the compensation rate structure has become comparatively simple. National or basic pure premiums are constructed for all the risks of a given classification throughout all the states; thus the desired volume of loss and pay roll experience is secured. The resulting pure premiums are "reverted" (corrected) to the required state level. It is important to note, however, that this average pure premium is used only when the experience of a state is deficient in quantity. In the current rate structure an important factor in rate making is that of credibility, or standard for measuring the reliability of a single state's experience. Its purpose is to permit a

state to make its own pure premiums to the extent to which its experience measures up to the standard of experience adequacy. The final rate as given in the manual is obtained when the pure premium is loaded for expense such as taxes, the cost of acquiring business (commission to agents and brokers and the expense of field supervision), the expenses of maintaining the home office, of inspection and accident prevention, of claim adjustment and the like. Among the recent innovations proposed in premium making is the application of premium constants designed to make the smaller risks bear a greater share of expenses and loss costs.

The manual rate is further refined in application to individual risks by merit rating, which has reached its highest development in workmen's compensation insurance. Merit rating has been evolved in part as a competitive weapon and in part as a means of accident prevention. The stock companies, which require some means of combating the low cost argument of the mutuals and rely heavily on the service given to their policyholders, have naturally led in this development. One type of merit rating is schedule rating, in which the award of debits or credits on the manual rate is made by reference to a schedule or list of the physical features of the risk. If the individual risk is more safely guarded and operated than the standard of safety set it will receive a credit or reduced rate; in the opposite case the insured must pay a rate higher than the manual. The essential feature of the schedule rating plan is that it assumes a direct relationship between the physical features of the risk and losses. Despite the fact that it leaves out of consideration the intangible causes of accidents it is unexcelled as a specific means of calling attention to undesirable equipment and practices. But it is expensive to operate and is subject to abuse by the companies, which are naturally tempted to make rates as low as possible. Where schedule rating is prospective and gives credit for appearances, experience rating, the other type of merit rating, is retrospective. It awards merits and demerits on the basis of individual experience; where it is worse than that of the group, the insured is penalized; where it is better, he is given a credit. Thus experience rating measures both the physical and intangible causes of loss. Its great advantage from the point of view of the carrier is its cheapness, because it is purely an office operation. As a way of giving an object lesson in accident prevention it is necessarily

inferior to schedule rating, since the offending process or machine is not specifically pointed out. The two plans at present are used together, even on the same risk, but the trend is toward placing more emphasis on experience rating. In the future the two rating schemes will probably be combined, experience rating serving as the basis and attention being called to the specific dangerous features of the risk. In the past one of the serious defects of both types of merit rating has been the persistent deficits resulting in premium income.

The National Council on Compensation Insurance is the dominant organization in compensation rate making in the United States. It is affiliated with local bureaus in all but a few states and through them it applies rates. Its entire operations are under the direct supervision of a representative of the Insurance Commissioners' Convention, who is chairman of all committees entrusted with matters of rating. For the other liability lines the national organization is the National Bureau of Casualty and Surety Underwriters. In general both organizations confine themselves to rating and allied functions and leave inspection, education and other services to the individual companies.

Perhaps even more important than correct rates are correct reserves. A reserve is a fund set aside to meet an obligation; it is held by the company in trust for policyholders and beneficiaries. There are two principal reserve funds: the unearned premium reserve and the loss reserve. The first of these consists of premium payments by the policyholders which have not been earned by the company at the date of valuation. This sum must be on hand to meet losses that will surely take place during the remainder of the policy period. Should the carrier go out of business it would reinsure all of its risks by transferring the unearned premium reserve to another company. It is needed also to make refunds to canceling policyholders. While the unearned premium reserve takes care of future obligations, the loss reserve is a fund for the payment of those already incurred. It is peculiarly vital in compensation and liability insurance: in workmen's compensation many of the payments are to be made in instalments extending over years, and the settlement of liability claims often requires considerable time.

The state regulates compensation and liability insurance at many points, of which the most important are rates, reserves, methods of claim settlement and production expense. In

Compensation and Liability Insurance — Competition 141

the United States the insurance departments of the state governments exercise only a most casual supervision over the making of rates. In over half of the states not even the filing of rates is required, and when power over rates is given a board or official it is generally only that of approval. The usual standard to which rates must conform is that of adequacy, supplemented sometimes by the requirement of reasonableness, but there are many states that have no standard at all. Only in the state of Texas does the public authority make and enforce its own rates. The regulation of reserves is more stringent. The uniform liability loss reserve law adopted in twenty states requires the maintenance of a reserve equal to obligations on policies over three years old discounted at 4 percent and to 65 percent of the earned premium (less payments already made) on policies less than three years old. The regulation of production expense has so far been attempted only in New York, but in matters of insurance regulation the influence of the insurance commissioner of this state is so far reaching as to be almost nation wide. The restrictions which he has approved have not yet been entirely successful, but the trend of the times will demand for workmen's compensation the same restrictions as are already imposed on life insurance.

Public liability insurance has been less affected by legal developments than employers' liability and workmen's compensation insurance because liability for injuries to members of the public is still governed more or less by the old law of negligence. With minor exceptions public liability insurance acquired independent importance only with the introduction of machines in transportation, building and other exposed industries. It was the increasing use of the automobile more than any other single factor that stimulated the expansion of public liability insurance. The first automobile liability policy was written in England in 1895, and the first automobile property damage policy in the United States in 1898. At present automobile liability and property damage (liability) premiums represent about one third of the aggregate casualty premiums in the United States, and the present trend points to further rapid growth. Thirteen states in this country and two Canadian provinces have already enacted some form of semicompulsory or compulsory automobile liability insurance. An interesting recent development in compulsory automobile insur-

ance is the suggestion that the principle of compensation without fault be applied to indemnification for automobile accidents. The numerous other public liability and property damage (liability) coverages available at present (see CASUALTY INSURANCE) are comparatively insignificant even in the United States, where they have reached their highest development. In 1929, for example, the net premiums for public liability and property damage other than automobile did not exceed 9 percent of total casualty premiums. Technically the various public liability lines closely resemble employers' liability and compensation insurance: they are written by the same carriers; rates and reserves are computed on the same principles. Important differences affecting rates and reserves are that while the compensation policy has no face, public liability forms have definite limits for injury to a single person and for total payments on a single accident and that a very important part of the public liability policy is the promise to defend suits against the insured, many of which are groundless and exaggerated.

COMPETITION is a term in social theory which associates the fact of a struggle with the function of order. It is the key word in an account, real, abstract or fictitious, of how rivalry for prestige and income, for power and wealth, comes to promote organization. It is by compe-

tion—whether of persons, firms, industries, nations, races, beliefs, habits or cultures—that the fittest survive; individuals, instruments and institutions of different capacities are given places in a going society; and an industrial system, whose personnel passes, materials decay and arrangements change, is adapted to new conditions. Competition is at once a process of selection, an economic organization and an agency of social development.

The genus, of which competition is a belated sport, is rivalry. The fact of rivalry is universal in life and in society. It is manifest in a struggle between germ cells for a chance at life; plants, for sunlight and growth; bats and heavers and elephants, for food and mates; and kind against kind and like against unlike, for a foothold on the earth. It is evident in the strivings which attend the round of everyday activities; one against another, bakers contend to provide wholesome bread; undertakers, to give peaceful rest to the dead; salesmen, to break down resistances; scholars, to surprise truth and make contributions to knowledge; and uplifters, to do good. It appears in every social order under which men have lived; in the conflicts of tribes for the unhappy hunting grounds; of holy men, for the glory of making the most prayers; of barons, for castles on the Rhine; of merchant adventurers, for the spoils of the East; and of capitalists, to bag the largest profits and to establish the biggest and best foundations. As event follows event into history a machine process wins its way against ancient crafts; a novelty called business displaces custom and authority in the control of industries; a fresh interpretation is read into the established law; a modern creed replaces outworn dogma in dominion over the human mind. If all the world's a shifting stage, rivalry distributes the ever changing parts among the ever new players.

Competition is rivalry subdued into organization by rules of the game. Nature after centuries of creative effort produced no such scheme of arrangements as the competitive system. No great convention, called to consider how industrial activities might be put together, contrived such a constitution for the economic order. It grew up at a time when the mediaeval regime of prelate and baron, of fief and glebe, was passing; it was essentially the product of petty trade. Into its making there went an element of choice, apparent in a few big decisions. The older way of authoritative control was rejected because of the mischief it had done; monopoly was unac-

ceptable because of the threat it carried. But there was no conscious judgment to abandon status, to establish contract, to transform landed into commercial property or to replace custom with the market in the making of prices. For the most part, such arrangements just grew up. They represent the accommodations of a myriad of men, in a million places high and low, to their own little necessities; they are the survivals of a series of chance judgments. The general features which characterize competition came into existence long before its elements were remarked or put together into a mental picture.

In spite of haphazard growth a structure may be discovered within the competitive system. It consists of two pairs of institutions: private property and contract; profit making and freedom of a trade. The usages of private property determine who is to hold and to control the various resources of society; the usages of contract, how persons, instruments and materials are to be brought together in the productive process. Together property and contract supply the mechanics of competition. The lure of profits draws individuals and corporations into industry and impels them to produce and market goods. The openness of an industry to all who care to take its chances prevents monopoly and limits money making to reasonable gains. The bait of profit is beacon and guide; the freedom of the trade is brake and governor. Together they direct industry, keep it orderly and adjust it to a changing social order.

Yet in no industry is competition as simple, mechanical or articulate as this. Each of the four institutions is a compound of many usages. The right to property is a bundle of equities, such as a voice in control, an interest in disposition and a claim to income, which may be put together into many permutations. An ownership of the old homestead in fee simple is one thing, the agglomeration of privileges which make up the ownership of a great railway system quite another. A shift in demand, the revision of a statute, an innovation in technology or a change of management may affect the character of a right or rob property of its value. The right of contract, once thought of as a voluntary agreement between equals, is a changing thing; it has been remade by the rise of the corporation, the coming of business and the growth of large scale production. At present many bargains with all their conditions are proposed by one party and accepted or rejected by the other. The profit motive appears in many forms; the corn grower

and the automobile manufacturer, the baron of steel and the baronet of coal, may be equally devoted to their own pecuniary interests, but the arts of money making which they practise are very different. All trades may at law be equally open, but in fact they are buttressed about by very different barriers against the intruder. Competition is too living to know a set pattern; the current organization of the shoe industry did not prevail at the turn of the century; the competition of grocers who vie for trade on the same street is unlike that of the cotton planters of twelve states who sell in a world market. The competitive system is sprawling and conglomerate as well as neat and orderly; it is contrived of institutions, each of which is prone to depart from its type; its operation depends upon men quite unlike each other in intelligence, knowledge, foresight and judgment. As a product of inconsequential growth it is a part of all that it has met. The norm may well be there, but a tangle of colorful detail confuses the simple lines of its structure.

Accordingly, a single explanation of competition is hardly to be expected. As with every attempt to run an abstraction through a mass of human behavior, the subject invites varied and conflicting statements. In popular writing, which is voluminous, competition is not distinguished from free enterprise, laissez faire and capitalism, and judgments are passed upon it as if it were a synonym for the prevailing economic order. On the one hand, competition is the gigantic motor which has caused nearly everybody to use his mental and physical powers to get ahead; it develops in the individual the habits of self-reliance, deliberation and eager, interested, universal watchfulness; it is that reconciliation of men to productive processes which issues in the largest aggregate of wealth. It is in alliance with morality, gives to a man material goods only upon condition that he become something of an idealist and allows him plenty only when he is personally capable of abstinence. It has lifted our race to a standard where the mode of living of common laborers is more comfortable and desirable than the everyday existence of the kings of whom Homer sings. On the other hand, competition is a nice new name for an ugly, brutal fact of all against all, without plan or system, without pity or mercy; it is a metamorphosis of the protean genius of graft; it is not law, but lawlessness; carried to its logical outcome it is anarchy or the absence of law. It is hymned by penny-a-liners and

philosophers as the god of all society; perhaps there is competition among the angels and Gabriel and Raphael have won their ranks by doing the maximum of worship on the minimum of grace. It might well inspire an epic on the consecration of cannibalism.

In professional thought competition is isolated and reduced to abstract statement. The economists were captivated by the Newtonian physics which, for the moment at least, had brought law, order and economy into the world of nature. So, with little thought of deliberate borrowing, they set about creating a mechanics of competitive business. To this end they employed a bit of observation, a goodly amount of abstraction and a bountiful measure of the most rigorous logic of the day. They made price—or value—the focus of their attention, selected buying and selling as the essential phenomena to be studied, disentangled the market process from general industrial activity and sought out the principles of the economic order.

The crux of the matter was to them the problem of economy. Its basic terms are a population of insatiable wants and a world of stubborn and inadequate resources. Out of the gifts of nature goods and services are to be produced which satisfy the demands of men; since there is not enough to go round, the wealth of the community must be made to go as far as may be. The result is a great productive system, with the market in the foreground, through which resources are painfully converted into pleasure giving goods. The actors are human beings, impelled by the utilities which articles of consumption possess to overcome the disutility of personal effort. Each must take his mite of service or his property to market and fetch away the wherewithal of his living. In the market goods and services are all tagged with prices and personal wealth comes by way of careful and shrewd calculation. In disposing of goods and services each has to compete with others who have like goods and services to sell. In seeking what one would have each has to bid up against others who would take it away. As a result value is a sovereign in the great competitive economy; an upward dart of price or a downward drop allows those who will pay most to purchase, gives a market to those who will sell for least and effects a neat adjustment between supply and demand. Under the double competitive process of seller against seller and buyer against buyer it cannot well be otherwise. For if it chances that a price is too low to effect a balance, a flood of bids

speeds it to the proper level; and if too high, a host of officers brings it down. The domain of competition is almost universal. The march of invention opposes new wares to old: motor busses to street cars, electric refrigerators to ice, radio to the phonograph. Wants even vie to create a competition between unlike goods: a modern car and an antique couch, an evening down town and a Sunday in the country are rival claimants upon one's income. With price as a guide competition continuously accommodates the production of goods to the changing demand for them. A delicate structure of responsive prices must keep on effecting the best mediation that may be between the wants of the people and the productive capacity of industry. The self-seeking individual is forced to have a thought about the community; acquisition is endowed with a social purpose. Thanks to the economic harmonies, there is no fundamental antithesis between competition and cooperation; competition is the way of cooperation.

There is, in short and in the abstract, a competitive order of economic forces acting of themselves and by themselves. The industrial system is an automatic self-regulating mechanism which must continuously secure from a niggardly nature just such goods as yield the largest surplus of pleasures over pains. It is a Newtonian economic system wherein matter is replaced by wealth, attraction and repulsion give way to utility and disutility, the phenomena of the market like those of the heavens are given an equilibrium, a system of checks and balances keeps the machine in order, and the theory of the conservation of energy finds a parallel in the law of the economic maximum. At the deft hands of the theorists competitive activity was converted into an account which was at once the great explanation and the great apology.

An abstraction easily becomes a norm to which reality must correspond. An ideal competition finds its counterpart in a policy of competition for a going industrial system. Accidents, tricks of one kind and another, combinations, frictions great and small, whatnots which will not fit in, are discarded as no part of competition. In the here and now - not *in vacuo* or by benefit of *ceteris paribus* - a practical competition gives assurance of order and economy to the affairs of industry. Its regime promotes efficiency in organization, economy in resources, fairness to the interested parties and orderly development in business. It tends to make each establishment in an industry tight and tidy, to

fit establishments neatly together into industries and to articulate industries into an orderly system. It allows little tolerance to waste; the producer who would survive must give constant thought to cutting his expenses and must keep his house in order. Accordingly, the ventures which together make up an industry cannot continue to absorb more laborers, use more materials or claim more investment funds than are necessary. Its rule safeguards the interest of the consumer. No seller can persist, against others who would have his market, in palming off low quality goods or in selling wares for what they are not; nor can he keep on charging more than the traffic will mercifully bear. Since the producer is ever alert to costs there is a constant spur toward progress in the industrial arts; since advances in technology quickly become common property the consumer is the lasting beneficiary of discovery and invention. The rule of competition insures to the workman the true and full value of his service; and reasonable arrangements in regard to hours, safety, health, discipline and hiring and firing. He is free to take or leave work in a shop, offer his services to a rival firm or hawk his labor in another industry. Finally, with some friction but without extravagant waste, competition accommodates an industrial system of many changing elements to the novelty in demand and circumstances which change brings. All in all a decentralized system is far preferable to the way of authority. It is far better to take a chance on a multitude of little judgments, made by interested parties, properly checked and balanced, than upon a few big decisions.

As fact, theory and policy, competition-as-it-is and as-it-is-set-down-in-books invites a varied attack. Critics, according to their several bents, are disposed to dispute its assumptions, to insist upon its limitations and to question its working. A first count, leveled against postulates, is an aspect of the prevailing skepticism. As a general challenge the critics wonder if industrial phenomena lend themselves easily to mechanical analogy; if a uniformity and a purpose have not been given to an inchoate mass of human activity; and if an alien explanation has not been driven where it does not belong. They inquire whether simplicity and symmetry are not of the mind rather than of things, a fashion in truth long since outworn. From this they proceed to more specific doubts. Are men in industrial activities impelled exclusively or even primarily by self-interest? If they are, has not

interest an economic objective? And, if it has, can it be written down in pecuniary terms? Are the myriad of human judgments upon which the operation of the system depends adequately grounded in knowledge, reason and foresight? Are materials, funds and labor responsive enough to direction to give the controlled flexibility which the working of the system requires? Will the march of time and unwilling events be kind enough to allow intent to be realized? Is the process that converts a host of petty decisions into a competitive order at work free from serious hazards? Here the essence of the matter is the start of the argument. As these questions are differently answered, the competitive system becomes to different students a reality, a norm, an abstraction, a hypothesis, a myth and a fiction.

A second count is directed at the pretentiousness of the competitive explanation. It aims rather to limit the province than question the rule of competition. The system works, not automatically but in response to human judgments; in any enterprise what is done depends upon where discretion lies. In different business units bondholders, owners of shares, directors, managers, underofficials, laborers and investment bankers have very different places in the scheme of control. Since each group has an interest of its own not identical with that of the concern the making of policy knows no set procedure. Nor is the way of discretion straight and narrow. A lack of knowledge of the business or of the industry makes for mistaken judgments. Oftimes a cake of custom makes management so much a matter of routine that a chance obtrusion of competition becomes a disturbing influence. The fear of losses and the promise of gains lead rivals to see merit in brotherly understanding; thus in many matters agreements come to replace the answers given by the operation of competitive forces. The state, departing from an ideal of non-interference, thrusts its regulatory will into the domain of private business. But even a qualified competition does not extend to the confines of the industrial system. Combination is not unknown in the land; railroads, telegraphs, telephones and waterworks bear only vestigial marks of a competition that is gone; the waning domestic industries are still under family control; and many important undertakings, such as the national defense, the maintenance of roads and the provision of education, are under the auspices of government. In short, a competition that will not run true to type has been com-

promised by a confusion of ends, by custom, by understandings and by interference from without; and the uncertain domain of a compromised competition shades off into monopoly, public utilities, household economy and state enterprise.

A third count is aimed at the competitive system at work. A test of theory by reference to facts is difficult. There are no certain standards by which the quality of its operation may be judged. Competition does not assure measurable results; the promise is only of getting as much as may be out of the resources and effecting the best mediation that may be among conflicting interests. As yet the facts that can be brought to judgment are a mere handful. The studies of its actual operation are far fewer in number than the accounts of how competition is supposed to work. But though available facts cover a mere fragment of industry they reveal a serious discrepancy between ideal and actuality. The consumer has his case: the quality of the ware is uneven and below standard, the sum he pays is in excess of the necessary costs of production, and a fitful price divides users into the favored and the unfavored. The laborer has his complaint: working conditions seem to be dictated by unenlightened self-interest, rates of wages defy explanation in terms of the laws of price, and existing standards of life are not adequate livings. The industrial engineer cannot easily reduce the competition-that-is to an orderly diagram: establishments keep on being wastefully run; bankruptcy claims the unfit but reorganization keeps them going; a potential capacity to produce is vastly in excess of market demand; shops, plants, factories and mines are jumbled into untidy industries. It is only crudely, irregularly, wastefully and with much suffering that businesses are accommodated to changing circumstance.

If specific studies fall short of an indictment at least they reveal a lag in economic organization. A scheme of arrangements which grew up amid the conditions of petty trade is hardly adequate to the great industry. The presumptions which underlie competitive policy do not belong to the world of the machine process, the corporation and quantity production. In the small town the tradesman can keep one eye on his customers, another on his rivals and both on his own shop; in the great industry customers are distant markets, an understanding of the industry demands a research organization, and the ups and downs of business depend upon factors

which lie at the ends of the world. In the small town the conditions of trade stand out in clear cut relief; all costs are direct, price is a guide to production, a gradually increasing unit cost prevents untoward expansion and insures sound growth. In the great industry each hides from his fellow his sales strategy, overhead costs click on with the clock, a diminishing unit cost tempts to expansion, and an overdone capacity makes for disorderly growth. In the small town an occasional improvement is made in an ancient craft; as its use becomes general there is time for an easy accommodation. In the great industry invention and discovery appear and take their turbulent way through the economic system. A competition adapted to the deficit economy of petty trade may fail to serve the surplus economy of big business.

In like manner competition has invited the attention of those who would do something about it. One group demands that it be preserved, pure and undefined, in all its native simplicity; another would eradicate the evil, root and branch, and substitute for it a moral economic order. But since the shortcomings especially remarked have been in specific performance, the general demand has been to mend the system and make it work. Revision has been a labor of love for those who would retain competition yet help it over the hard places and make smooth its going. Its arrangements have been modified from within. Business men, through trade, industrial and commercial associations, have aimed at only so much of cooperation as will make competition less ruthless and more rational. Farmers, resolutely opposed to monopoly in all its forms, have organized cooperatives to escape the tyranny of an uncontrolled market. Laborers have used the trade union only to secure a bargaining power equal to that of employers. If the state has interfered in private matters, the use of formal authority—to conserve natural resources, to set up weights and measures, to insure the quality of the ware, to fix hours of labor, to provide compensation for accidents, to distinguish "fair" from "unfair" competitive practices, to determine a plane of competition and to establish great industrial codes—leaves the rival firms in an industry as free to compete as before. In the wake of collective action and state intervention there appears a regulated competition.

The integrity of competition is not proof against such amendment. An up to date competition which has a moral code, rules of the game

and an umpire is not the old fashioned competition of each for himself and the devil take the hindmost. Even if rivals continue to be free to vie for custom, the matters brought under direction are no longer determined by resort to the ordeal of the market. If quality, hours and compensation are rescued from the play of economic forces and placed under authoritative control, wages, prices and performance might well follow. As item after item is withdrawn, competition ceases to be the great arranger of economic affairs. A voluminous literature is concerned with the possibilities of a controlled competition. In it a formal authority, such as the government or an economic council, is alike to determine quality, service and price and to fix wages and working conditions. Since neither consumers nor laborers may be exploited rival traders can earn profits only by improving technical processes and reducing the expense of waste. Hostile critics, conscious of its vanishing domain, have referred to the new competition as an engaging name for a novel sort of collectivism.

A constructive effort has been made to maintain competition. The free competition of the books has been paralleled with the enforced competition of the courts of law. In its dependence upon contract lies an inherent weakness in the institution. So long as buyers want goods and sellers are willing to accept dollars, liberty of contract gets things done and promotes order. But on occasion the lure of the same dollars makes it to the advantage of producers to agree among themselves to control capacity, to regulate output and to stabilize prices. Again the state is invoked, this time to make rivals compete. Freedom of contract is to be allowed along the vertical line, between buyer and seller; but it is to be prohibited along the horizontal line, between buyer and buyer and seller and seller. It is to be allowed where competition makes insecure the gains; it is to be prohibited where agreement is used to secure the gains. As long ago as the reign of Elizabeth there were statutes against monopoly; a comprehensive code against the restraint of trade has become part of the common law; the states of the union have attempted by statute to protect the good people against combinations; and in the Sherman, the Clayton and the Trade Commission acts the national Congress has read enforced competition into the law of the land.

The statutes in behalf of competition invite a study in law enforcement. A violation of a act and a sentence of conviction are separated by

many barriers. An overworked department of justice may never get around to the case. The evidence, in the possession of persons who have an interest in concealing it, may not be forthcoming. A clear violation of the spirit of the act may not be comprehended in the letter. A maze of legal issues, upon any one of which the decision may turn, may divert attention from the main question. A complicated procedure of exception and demurrer and appeal, of review and re-review, of questions of fact and of law, may in the end wear the case out. Over a period of forty years the administration of the federal antitrust acts has resulted in an insignificant number of penal sentences, the collection of only a few million dollars in fines and the confiscation of a few cartons of cigarettes illegally shipped in interstate commerce.

A translation of an economic policy into legislation is always an uncertain adventure; the words of the antitrust statutes have not been free from peradventures. At one time the none too definite standard of the rule of reason was set up as the test of whether or not monopolistic practises fell afoul of the law [Standard Oil Co. of New Jersey et al. v. U. S., 221 U. S. 1 (1910)]. At present activities of trade association that stop measurably short of price fixing are within the tolerance of the courts [Cement Manufacturers Protective Association et al. v. U. S., 268 U. S. 588 (1925)]; but agreements among competitors to maintain prices, even though they be reasonable and impose no additional burden upon consumers, are under the ban [U. S. v. Trenton Pottery Co. et al., 273 U. S. 392 (1926)]. In the British dominions, on the contrary, rivals may take reasonable precautions against cut-throat competition, and English law has no place for "a rule of possible evil" (Attorney-General of the Commonwealth of Australia v. Adelaide S. S. Co., 1913 A. C. 781). It is not without significance that many cases under the Sherman Act have arisen out of small scale business and that conspicuous victories for the statute have been won in outlawing practises of trade unions. If legislation has helped toward the preservation of competition the result must be due not to effective and vigorous enforcement but to the devotion of captains of industry to the spirit of the law.

A thousand trends which attend the coming of the new industrial revolution are amending the individual competition of petty trade into an organized competition within and between great industries. A competition, never so pure or

prevalent as assumed, is likely to be further compromised by acts of the state; it is more likely to be transformed by the growth of a scheme of formal control within business itself. It may well lose its identity in an authoritative economic order which will come to replace the state, just as the state replaced the church, as the dominant agency of social control. In any event the devices and procedures, the understandings and arrangements, which make up competition are being remade by changing circumstance; presently only a surviving sport will tell of an institution that once lived, inspired schematic economics and perplexed its critics. Its place and function are to be taken by some scheme of control for subduing conflict into organized struggle, for in any future ordering of human affairs, however backward, revolutionary or utopian, rivalry must have its place. Only in such a non-economy as heaven, where celestials are free from wants or there is a surfeit of all good things, can it be absent. The parties, the forms, the fashions, the rules, the intensity and the ends of struggle may change; but the norm of competition among persons, goods, industries, ideas, institutions and cultures must remain.

COMPOSITION. See LAW.

COMPROMISE is that mode of resolving conflicts in which all parties agree to renounce or to reduce some of their demands. A compromise, in contrast to a dictated solution such as is involved in coercion and conformity, implies some degree of equality of bargaining power. The agreement involved in compromise is also to be distinguished from that involved in integration. In the former case each party is able to identify

the precise extent of his losses and gains; in the latter, new alternatives are accepted of such a kind as to render it extremely difficult to discern the balance between concessions made and concessions received. Conflicting demands about wage scales, for example, may be deferred to an indeterminate future, while it is agreed to experiment meanwhile with a new means of inaugurating and of sharing production economies. The latter course of action may have arisen during struggle or negotiation, and it may have brought about a redefinition of the interests of the contending groups.

Any theory of the strategy of making compromises would prescribe that adjustments be sought before differences have been so sharply drawn that considerations of prestige distort calculations of expediency. Compromises are often made impossible because the conflicting parties have gone so far in pushing their demands that they cannot compromise and still "save face." Such a theory would emphasize the advantages of drawing attention to the values which are cherished in common, in the hope of avoiding too much concentration upon values which are mutually exclusive. When there are many such values held in common, success in the pursuit of any particular value is secondary to the preservation of the whole network of common interests and sentiments. But when a working arrangement is reached through compromise under the stress of emergency, it can survive only if it becomes fortified by the accretion of other interests and by the growth of emotional bonds.

Society relies on compromise to adjust the conflicting claims of law and right that are couched in terms which if taken literally would render collective action impossible. In the memorable phrase of Burke, "All government . . . is founded on compromise and barter. We balance inconveniences; we give and take;—we remit some rights, that we may enjoy others." No constitutional system can function smoothly without the growth of conventions which represent the sacrifice of formal claims to working necessities. This is particularly obvious when there is a division of power between central and local units of government and where there is a separation of powers among several branches of government. Even in absolute monarchies and dictatorships the ruler must concede much to the sentiments and interests of his subjects. While it is common to cite these instances as cases of compromise, this usage is not strictly accurate, since constitutional usages generally

grow without conscious arrangement. The true compromise is the conscious modification and adaptation of demands. It is more likely to be found in democracies, where the party system is relied upon for everyday governmental functioning, and especially when, as under a multi-party arrangement, a process of bargaining between the parties for political advantage precedes the formation of a relatively stable government.

One salient feature of compromise is that it implies the objectification of values. Sometimes this objectifying process proceeds until a common measure of value is accepted for numerous operations. This is the function of money in economic transactions; and to the extent that conflicting demands can be reduced to money terms, as happens often in collective bargaining and industrial conciliation, compromise is made easier. Political values involve calculations of fighting power, which are clearly evident in international relations, but political values have never been objectified in any single index. The "balance of power" as the basis for international strategy came nearest to working effectively when one acre of land was approximately equal in value as a source of men and materials to every other acre, but even this assumption was never consistently adhered to. No medium of exchange could be devised which would bear the same relation to estimates of fighting power as monetary metals bore to estimates of economic value.

Although compromise is generally conceded to be indispensable and is often commended by liberals as a substitute for revolution, a philosophy of compromise has been severely criticized. Attitudes are supposed to arise which encourage the temporizers and discourage the responsible social thinkers. John Morley spoke bitterly of the notion "that if a subject is not ripe for practical treatment, you and I are therefore entirely relieved from the duty of having clear ideas about it" (p. 77). He complained of several factors which conspire to transform intellectuals into temporizers. Due to the rise of the scientific attitude "opinions are counted rather as phenomena to be explained, than as matters of truth and falsehood" (p. 25). Men are made self-conscious of the relativity of their own ideas and indisposed to insist upon them. The concept of evolution itself may often be construed to "place individual robustness and initiative in the light of superfluities, with which a world that goes by evolution can well dispense" (p.

26). During transitional periods hope is often pinned on reforms which are soon shown to have no efficacy, and disillusionment ensues.

Compromise is favored by tendencies which are early organized in the experience of the individual. These tendencies are often spoken of as impulses to submit, to subordinate the self. It is customary in the growth of the mind to stress the assertive drives which are unfavorable to compromise and to neglect the role of other human characteristics which prepare the way for the smooth adjustment of interpersonal relationships.

COMPULSORY VOTING. See VOTING.

COMPURGATION was a legal procedure whereby the party upon whom the burden of proof in an action rested cleared himself by his own oath supported by the oaths of a number of oath helpers. The practise was widely distributed throughout mediæval Europe, principally among Germanic nations, and still survives in a few remote places, e.g. the Caucasus. It existed in a bewildering variety of forms. Sometimes the compurgators had to be kinsmen, sometimes kinsmen were excluded; sometimes they were selected by the principal, sometimes by his adversary, sometimes by a public officer and frequently by ingenious combinations of these methods; their number might depend upon the gravity of the issue, the status of the parties and of the compurgators themselves, a noble being the equivalent of several commoners. Generally, but not always, the oath of the compurgators was merely that they believed their principal's oath to be credible. They seem never to have had to give their reasons for swearing or refusing to swear.

The origin of compurgation has caused much speculation. It is very probable that it was connected with the solidarity of the family group. With the decline of the social order based upon family solidarity the institution continued, but

on newly invented rational grounds, serving as a rough indication of the party's credit in the community. It has been suggested by some that the compurgators were in the first place actually witnesses and only later became auxiliary swearers; to others the reverse seems more probable; and, again, the similarity to the ordeal has been emphasized. A definite conclusion on these questions is hardly possible at the present time, and it is not necessary to assume that the history will be found to be the same in all regions and in all periods.

The church naturally adopted compurgation (*purgatio canonica*) from the habits of its subjects, and Innocent III rationalized it by confining it to cases where the accusation was based upon ill fame and accompanied by suspicion but unproved by evidence, thus converting it into a test of reputation. In this form it survived in England for the trial of clerks and laymen in ecclesiastical courts even after the Reformation. Those clerks who were sent by royal justices to the ordinary as clerks convicted of felony but entitled to benefit of clergy had to find compurgators until 1575, when purgation was forbidden them on account of the "sundry perjuries" which by this date had become notorious. Laymen, and clerks other than those convicted of felony, could be put to their purgation by ecclesiastical courts until the statute of 1661 which abolished the oath *ex officio* and seemingly the canonical purgation as well.

At common law compurgation (wager of law) ceased to be a complete defense in criminal cases after the Assize of Clarendon in 1166. The only exceptions were London and certain boroughs which retained wager of law in felonies as a valued privilege. In civil matters it had been restricted judicially by the close of the thirteenth century to certain actions such as debt, detinue and account and a few other rare cases. But when such actions as *assumpsit* became available where debt would have lain, and trover where detinue would have lain, and accounting could be had by bill in equity, compurgation became of even less importance. Boroughs, however, secured its legislative extension in some cases, evidently finding it a satisfactory procedure. It was finally abolished in 1833.

It is doubtful whether wager of law existed in America, but it is certain that in some cases a defendant could "purge himself" by his own unsupported oath. Compurgation is no longer regarded as an origin of the jury and has no historical connection with the modern practise

of introducing evidence of character and reputation.

COMSTOCK, ANTHONY (1844-1915), American vice crusader. Comstock has become the symbol of the use of the police power by quasi-official societies for the enforcement of what they regard as good morals. Inheritor of the residual Puritanism of New England, he was disturbed as farm boy, as volunteer soldier (1863-65), as New York clerk and as traveling salesman by the dangers for young men in the current gross solicitations to vice. At twenty-eight he destroyed, single handed, important sources of pornographic books and pictures in New York. This zeal was rooted in his religion and partly also in an undecipherable personal psychology. The volunteer reformer enlisted the help of Morris K. Jesup and other business men, supporters of the Young Men's Christian Association. They had the scant existing legal barriers to pornography in New York buttressed with new statutes and in 1873 organized the New York Society for the Suppression of Vice under a charter that granted police powers. Comstock, the secretary, became a novel kind of prosecutor. Meanwhile, to stop leaks of obscenity through the post office the moral forces obtained the passage on March 3, 1873, of the federal statute later dubbed the Comstock Law. This provided penalties for the mailing of alleged obscene publications or information on contraception and the methods or materials for producing abortion. The last clause reflected the conviction that lust would conquer everybody if conception

could be avoided; subsequently it was used to stop the scientific or popular discussion of birth control. Comstock became a special post office agent (without salary) and soon instituted a series of famous prosecutions against actual purveyors of immorality and also against respectable persons who wanted freedom to discuss sex. The natural urge of an organization to function plus Comstock's cultural limitations led him to extend his bans to indefensible extremes against works of art, science, literature and drama. For forty years the battle raged between what Bernard Shaw called "Comstockery" and its opponents, who declared that obscenity was too subjective to be defined, that the censorship was a dangerous usurpation and that education alone, not suppression, would help society. Before his death, his power undermined by ridicule and the new liberalism in sex thought, Comstock passed from the picture. His society still exists under more restrained direction.

Comstock's personal life was blameless; he died in modest circumstances, having refused bribes and turned his fees over to the society; he was certainly brave. Well intentioned but limited by ignorance and temperament, he reflected the moral attitude and sex knowledge of his times. His vast labors abated crass commercial pornography. He helped the medical profession and health movement by his attacks on abortionists and quack advertising. He forced the newspapers to bar immoral personals and to scrutinize their advertising. This scrutiny led to later reforms. His attitude probably forced the proponents of freedom of discussion about sex and enlightened sex education to define and defend their liberalism. Dispassionate critics declare that he attacked few really serious works of art or science and that the total of his final suppressions was practically nil. He tried to understand the views of art and science far more than their proponents tried to understand him.

On the other hand, Comstock began by fighting real evils and turned aside to fight imaginary ones. He hampered constructive measures by silly and intemperate deeds. He entangled innocent reformers by the decoys of the *agent provocateur*. He made censorship odious but established the principle in the federal government and opened the way for prosecutions aimed at radical critics of the existing order in economics, politics and morals. The bans against vice became bans against new ideas. But others than Comstock were the true inspirers of these at-

tacks. The great evil he did was in stopping for a generation by the federal birth control clause the sane and scientific discussion of an important principle.

Several vice societies, inspired by Comstock's vigor and rationale, arose after 1873. The principal one (reflecting again an essentially Puritan impetus) has been the New England Watch and Ward Society of Boston. Such pressure groups express a characteristic American bent based on residual Puritanism and business orthodoxy.

COMTE, ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER (1798-1857), French sociologist. Comte was born at Montpellier of Catholic royalist parents. At the École Polytechnique, which he entered in 1814, he came under the influence of the writers with whom throughout the subsequent course of his life he was to retain some degree of intellectual affiliation. From the traditionalists Bonald and especially de Maistre he borrowed the notion of an order governing the evolution of human society, and from Condorcet the idea that this evolution was attended by progress. Between 1818 and 1824 he was associated as secretary, disciple and friend with Saint-Simon, who stimulated his interest in economics. It was during this period that Comte worked out his general conception of social science, to which he gave the name of sociology.

Comte's ultimate purpose was the political reorganization of human society. His fundamental conviction was that such reorganization must wait upon the spiritual and moral unification of society. Believing that the evolution of the human mind proceeded according to definite laws he regarded it as his first task to isolate and demonstrate them by scientific processes assisted by historical verification. This was the aim of the great *Cours de philosophie positive* (6 vols., Paris 1830-42, 5th ed. 1892-94; tr. by H. Martineau, 2 vols., 3rd ed. London 1893), the first volume of which he opened with the

postulate that the evolution of knowledge is governed by the law of the three states, a law previously stated by Turgot and Saint-Simon. By an array of historical evidence—well selected for the purposes of his theory—he then proceeded to show that in his first inquiries into the causes of phenomena man inevitably propounded a theological explanation; that this explanation, which gradually lost its essential theological elements as it appeared under the successive aspects of fetishism, polytheism and monotheism, was at length supplanted by metaphysics, representing an attempt to discover through the process of reason the essence of phenomena; and that the metaphysical stage had eventually given way, or was giving way, to the final or positive stage. Here the mind abandons its search for essences and absolutes and contents itself with the discovery of relationships between phenomena, that is, with the construction of sciences. In tracing the evolution of the positive sciences Comte formulated his second great law, that of decreasing generality and increasing complexity, which signified that the sciences developed, and could develop, only in a definite order: mathematics, astronomy, physics, chemistry, biology, sociology. Each science depended upon those preceding it for its positive content; the series, and with it the spiritual or intellectual unification of society, was complete when sociology was evolved.

Comte was now prepared to expound his plan for the practical reorganization of society on the basis of the principles of sociology. In the interval between the completion of the *Cours* and the appearance of the *Système de politique positive* (4 vols., Paris 1851-54, 3rd ed. 1890-95; tr. into English, 4 vols., London 1875-77), in which Comte outlined this plan, he contracted a friendship with Clotilde de Vaux, whose death in 1846, a year after their meeting, produced in him an emotional crisis and brought to the fore all his pent up mysticism. The experience affected his conception of the process of social reorganization, which he now came to regard as essentially religious. Hence to some of his disciples, such as Littré in France and Mill in England, the *Système* brought bitter disappointment, and the master was accused of having ruthlessly abnegated his past doctrine. In reality, however, the fundamental principles of the work represent not a *volte face* but a harking back to certain neglected ideas of Comte's youth, logically harmonized with the implications of his sociology.

The central thesis of the *Système* is the necessity of unifying all divergent beliefs and practices through the establishment of a religion of humanity. The positive religion was essentially a system of ethics, absolute in that it applied to all men and culminating in the worship of the symbol of humanity. Comte's passion for systematization led him to construct down to its minutest details a plan for the practical organization of this religion, a plan showing unmistakable traces of his admiration for mediaeval Catholic institutions. In the positive society the spiritual authority would be not only independent of the temporal but superior to it. Desiring to render his idea in supremely concrete terms Comte introduced into his scheme many elements, such as the calendar of saints—positive saints, the servants of humanity—and the hierarchy of sacraments, which appeared to certain less mystical persons as the wanderings of a deranged mind. Comte himself was the first to admit that these elements in his religion were rooted in forms of thought destined to disappear; to him they were no more than symbols, as Clothilde was the symbol of womanhood and womanhood the symbol of humanity.

Whatever the value of Comte's specific scheme for social reorganization, however far from reality he may have strayed in constructing it, his disclosure of the necessity of treating all social thought as an interrelated whole had a profound influence upon the subsequent development of the various social sciences. In obedience to the dictates of his system he refused to recognize either politics or economics as an independent science, and in politics he was, like the traditionalists, superficially a reactionary. Yet his thought was not without influence in widening the scope of both of these disciplines. The positive criminologists, inspired at least in part by the currents he had set in motion, revealed the inadequacy of the old rigid criteria of crime and punishment and pointed out the manifold environmental factors which justice must take into account. Historians felt the impulse of Comte's work both because he demonstrated the methodological importance of history in the discovery of social laws and because he emphasized the variety of phenomena into which it must penetrate. His insistence upon the role of universal education in the achievement of social unity helped to open new avenues of endeavor for educational theorists. Considered in these broad aspects the influence of positivism has been too far reaching to be

sought in the work of any single thinker. The direct imprint of his thinking can, however, be seen in the French scientific movement of the last half of the nineteenth century, represented by Taine, Renan and Berthelot, and in the writings of such outstanding English figures as John Stuart Mill, who between 1841 and 1846 was in close communication with Comte, and Herbert Spencer, in spite of the latter's repudiation of Comte's laws of evolution. Contemporary sociology not only owes to the creator of positivism its existence as an independent science but possesses the seal of his authority upon three fundamental precepts in its methodology: the necessity of treating social facts like physical phenomena, of reducing them in the final analysis to social beliefs and of applying to them the method of experimental investigation.

CONANT, CHARLES ARTHUR (1861-1915), American journalist, economist and practical banker. His early advocacy of a central banking system in the United States marked him as an advanced thinker in the field of banking theory. In the book for which he is best known, *A History of Modern Banks of Issue* (New York 1896), now in its sixth edition (New York 1927), he showed the superiority of a central banking system over the highly disorganized system then prevalent in the United States. This book was for many years the main source of information and inspiration for later writers on the subject of central banking. Conant was one of the pioneers of monetary reform in the Latin American countries and in the Philippine Islands and gave practical assistance in Mexico, Nicaragua, Cuba and the Philippines. He took an active part in the work of the United States National Monetary Commission and prepared for the latter two reports, "The National Bank of Belgium" and "The Banking System of Mexico" (in National Monetary Commission, *Publications*, vol. xvi, nos. i ii, Washington 1910). A prolific writer, he published more than sixty articles relating to the field of banking theory and practice, edited the "Foreign Banking and Finance" department of the *Bankers' Magazine* and participated in a number of movements which led to important banking legislation. Among these was his advocacy of a uniform Bills of Exchange Act, in connection with which he served in 1910 and 1912 as American delegate to the International Conference on Bills of Exchange at The Hague. In 1903 he was a member of the Commission on International Exchange which attempted to establish a fixed relationship between the moneys of gold standard and silver standard countries. He also served on the New York Chamber of Commerce Committee on Currency Reform which in 1906 reported favorably on the establishment of a central bank.

MARCUS NADLER

Important works: Principles of Money and Banking, 2 vols. (New York 1905); *A Special Report on Coinage*

and Banking in the Philippine Islands (Washington 1901); "The Currency of the Philippine Islands" and "The Way to Attain and Maintain Monetary Reform in Latin America" in American Academy of Political and Social Science, *Annals*, vol. xx (1902) 518-33, and vol. xxxvii (1911) 618-27.

CONCENTRATION, INDUSTRIAL.. See COMBINATIONS, INDUSTRIAL.

CONCERT OF POWERS is a phrase used to designate the system, employed in the nineteenth and the early twentieth century, by which the Great Powers sought to establish a common policy of cooperation to prevent war and the spread of revolutionary tendencies. They aimed to achieve their objectives through international conferences called to deal with specific problems.

In 1804 as a result of the Napoleonic wars Alexander I of Russia, then a liberal idealist, presented to England a plan for the reconstruction of Europe on the basis of an intimate concert between the two powers. This ripened, with modification in a conservative direction, into the efforts made by the Congress of Vienna and the Holy Alliance to preserve the constitutional and international status quo. Between 1818 and 1914 there were held approximately twenty important conferences, in some of which the United States participated, for settling amicably by cooperative effort various questions which threatened to disturb peace. The earlier conferences at Aix-la-Chapelle (October 1, 1818), Troppau (October 20, 1820) and Verona (October 20, 1822) endeavored largely to prevent the spread of revolutionary movements inimical to monarchical authority and conservatism; in the long run these aims failed because they contravened the new dynamic forces of nationalism and democracy, with which England sympathized and which caused her withdrawal from the Concert.

The field in which the Concert of Powers, or in this case the "Concert of Europe," has been most active and successful has been in dealing with the Near East. Ever since the Greek War of Independence the Great Powers have endeavored to restrain the chronic elements of disorder in the Balkans and in the eastern Mediterranean regions which arose from the progressive decay of the Ottoman Empire and from the superposition of a Mohammedan autocracy over mixed populations of Christians at feud with one another no less than with their nominal rulers. The Concert became active with the appearance of Mehemet Ali, but failed to prevent the

Crimean War or the Russo-Turkish War of 1877. It has, however, upon several occasions prevented a local Balkan war from developing into a general European war, notably in the cases of the Serbo-Bulgarian War of 1885, the Cretan War of 1897, and the Balkan wars of 1912-13. But even in this last case the authority and dignity of the Concert was often rudely flouted by the Balkan allies, as when they went to war against Turkey in 1912 or as when Montenegro, with a population one tenth of that of New York City, defied the powers and their international fleet in the question of Scutari.

A case of a different kind in which the Concert of Europe functioned successfully was the occasion of Holland's contemplated sale of Luxemburg to France in 1867. From the narrow standpoint of "sovereignty" this sale was the affair of nobody except the parties immediately concerned. Bismarck, however, intimated that if the sale were consummated it might lead to war between France and Germany. Thereupon the powers intervened in the interests of the peace of Europe and at a conference held in London the question was settled by their collective guaranty of the neutrality of Luxemburg.

The idea of the Concert of Powers is fundamentally different from the balance of power principle. The Concert aims to secure harmony and cooperation by conciliation and by minimizing the tendency of the powers to group into opposing combinations. Balance of power aims to secure the status quo and peace by grouping the powers in such combinations against one another as to establish an equilibrium which none will dare to attempt to overthrow. But such attempted balancing is rarely stable and causes infinite international fears, suspicions and armament rivalries. During the Balkan wars of 1912-13 peace among the Great Powers was preserved in part because the powers, led by Sir Edward Grey and Bethmann-Hollweg, generally placed the Concert of Europe above the balance of power principle as represented in the Triple Alliance and the Triple Entente. In July, 1914, this was not the case.

The Concert of Powers may be regarded as one of the most successful experiments toward international government prior to 1914. In spite of its occasional failures it not infrequently effected cooperation among the Great Powers sufficient to avert war. Its weaknesses were that its conferences were too often controlled by considerations of expediency rather than of justice, were commonly composed of diplomats

rather than of responsible ministers and represented only the Great Powers, who paid little or no heed to the rights and interests of small states. These weaknesses are largely avoided in the League of Nations, by which the Concert of Europe has now been virtually superseded.

On the American continent the pan-American conferences, initiated in 1889, offer a fruitful and increasingly successful "Concert of America."

CONCESSIONS. In the modern state the individual may generally engage in trade or other economic enterprise without special permission. There are, however, certain classes of economic activity which do require governmental permission, variously termed, in different countries, franchise, license, patent, charter, monopoly, grant, approbation, admission and concession. The use of these terms is by no means uniform. The term concession is customarily applied in international law to all such authorizations. Permission required merely in order that the public authorities may examine the qualifications of the applicant and of his enterprise is in some countries called a concession. In the United States the term is generally reserved for rights existing abroad. This article will deal only with rights concerning economic activities which are of a public or semipublic character in that they have been or are deemed normally to be reserved to the granting public body, or are deemed to be of a special public interest. In the latter case it will usually be found that in some other country the same type of activity is governmental. Furthermore the article will be restricted to international concessions. While with the development of the modern concept of public utilities concessions granted by a country to its own citizens have become rather more important than formerly, concessions granted to foreigners raise special problems because foreign management, often foreign cap-

ital and sometimes foreign labor are engaged in activities which have a special connection with the national interests of the granting country.

Almost any kind of economic activity may be the object of a concession: the exploitation of raw materials (oil, minerals, timber) or agriculture, manufacturing, trading (import or export) or transportation (inland or coastal navigation, railroads, surface cars, busses, aerial transport). Yet an enterprise which requires a concession in one country may be entirely free or entirely forbidden or reserved to the government or nationals in another country.

Any governmental body—unitary state, component state, federation, province, district, municipality or native chief in a colony—may be the grantor of a concession. The grantee may be an individual or individuals, a private or public corporation or even a state or other governmental body. For the purposes of international law protection it is important to distinguish between grantors possessing personality in international law and those not possessing it. It is also essential to differentiate between grantors conferring the concession by virtue of original or delegated legislative power and those without legislative power, because only the former are able to change their own obligations or the rights of grantees by means of legislation. In almost all cases the grant is made after application by the grantee or after negotiations have led to an actual agreement. The grant itself may be created through a public unilateral act or through a contract under the private law or more frequently under the public law of the grantor. A treaty between the granting state and state of the grantee will not give rights directly to private persons but merely provides for their creation under a system of municipal law. These distinctions are of more than technical importance. Legal protection is weakest where the basis of the concession is a unilateral public act, for in this case the grantor can modify the grant, subject only to constitutional or statutory restrictions. Legal protection is stronger where the basis is a public law contract, but even in this case the grantee is not treated in all respects as the legal equal of the grantor. The strongest type of legal protection exists where the concession is created through a private law contract and where therefore the two parties are treated more nearly as legal equals. The existence of a treaty may in all cases afford additional protection.

In law a fundamental distinction exists between rights concerning the having or the acquiring of tangible things or other objects such as real property rights or debts (*jura habendi*) and rights which consist in the permission to engage in a certain kind of activity such as patents (*jura faciendi*). The principal rights of a concession holder are always of the latter type.

The principal right of the concession is directed not only against the grantor but also against third parties, who may not lawfully interfere with its exercise. It is, however, not usually a monopoly right. Monopolistic concessions are necessarily of a character affecting public interests directly, even if the activity as such is not one which is deemed to be different from ordinary activities. In the more important concession agreements the principal right is frequently supported by a considerable number of auxiliary rights. The grantee may be given rights over, or title to, land or the right of expropriation over land or other property needed for working the concession. He may obtain money subsidies, tariff or tax exemptions or the right to buy supplies from the grantor or other sources under special conditions. He may be authorized to create a corporation without special permission or different in structure from those permitted under the general laws of the grantor state. He may be permitted to employ labor under conditions especially favorable to the concessionaire. Territorial sovereignty or rights approaching it may occasionally be given either to the grantee or to his home state. Such auxiliary rights are sometimes known as concessions but they should not be confused with the rights ordinarily covered by that term. From a legal point of view it is important to ascertain which auxiliary rights are dependent for their continuation upon the continued validity of the main right and which are independent so that they can outlast the concession itself.

The grantee of a concession is not always obligated to exercise the rights conferred. In many cases, however, the concession has the character of a function which involves both duties and rights. Even when the exercise of the rights is not a duty it may be subject to regulation which may concern prices or other details. In addition the grantee may be obligated to make payments to the grantor especially in cases of monopolistic concessions.

A concession may be granted for a definite or an indefinite period of time. If the concession

is likely to outlast the economic and political conditions under which it has been granted, stipulations concerning the liquidation and possibly the repurchase of the concession become important.

Interference by the grantor state with concessionary rights involves problems of a special and complicated nature, resulting largely from the fact that the concession is usually at one and the same time a private property right of the grantee, a contract relationship to which a government is a party and a right affecting governmental interests. Where the concession is regarded as existing under a public unilateral act or a public contract the ordinary tribunals of the granting country may not be competent to decide disputes arising out of the concession, and the grantee may therefore be forced to rely upon administrative tribunals or other governmental bodies in charge of deciding administrative disputes. It is possible, even in other than so-called backward countries, that the grantor does not allow such disputes to be submitted to any judicial or quasi-judicial body. Normally the grantor is immune against lawsuits abroad. Should a dispute concerning a concession come up before a foreign tribunal, as for instance when the grantor has consented to such a suit, it is probable that the law of the grantor would be applied to the main right as well as to most other aspects of the dispute, since it concerns the exercise of public or quasi-public functions in the granting country. Even if judgment is rendered against the grantor its enforcement may be limited inasmuch as assets of the grantor are in the main likely to be immune against attachment. Unless the concession is granted to a government and exists under a treaty, international law cannot govern the concession agreement itself; the home state of the grantee can only base protests on international law if the grantor violates a treaty obligation or the general rules of international law concerning protection of acquired private rights. Where the grantor government violates its own laws and fails to give adequate remedy in its own courts, the government of the grantee may base its protests on clear violations of international law. Whether such disputes will ultimately come before an international public tribunal depends upon pre-existing and subsequent agreements between the two states. Concessions have often been the subject of international public arbitration. Provision for private arbitration directly be-

tween grantor and grantee is as yet not a common feature even of the more important international concession agreements.

A distinction must be made between interference by virtue of preexisting laws and interference by virtue of later laws. A concession may be voidable from the outset, due to pre-existing laws against deceit, coercion or similar measures employed in obtaining the concession. The most important ground for cancellation is the failure of the grantee to live up to some one or more of the numerous obligations or conditions imposed on him, provided that such breach or default was, under the preexisting law, a cause for cancellation. Abuse of the concession or other illegal acts of the grantee may also lead to cancellation. The attempts of concession holders to exercise indirect political control, however, although a much discussed source of friction, will not necessarily be illegal under the laws of the grantor country.

Many modern constitutions provide for the cancellation or confiscation of private rights. Concessions acquired in the face of such provisions are necessarily precarious from the outset, and a bona fide cancellation is a lawful exercise of reserved governmental powers. Similar problems have arisen in the past in case of concessions and other rights granted by absolute kings and independent native rulers possessed of the right to destroy private rights at any time.

Since the grantors are also legislators, or at least able to exert strong influence upon the legislature, they possess a power usually beyond that of a private party to a transaction, namely the power of changing existing laws to their own advantage and to the disadvantage of the grantees. The illegality under international law of the application of such laws to foreign concessionaires is a highly controversial question. Factors which must be considered are as follows: whether tangible property is protected against confiscation with or without compensation; whether the semipublic character of a concession exempts it from the protection accorded to purely private rights; whether the existence of a specific governmental promise should accord a higher protection (mainly with regard to specific maintenance) than exists for property acquired without such promise; and whether the legal status of the concession as a private or public contract right or unilateral act is a basis for different treatment. Auxiliary rights should be treated independently according to their own merits unless they are clearly

dependent upon the concession. Landed property and debts will normally enjoy a stronger protection than concessions.

The position of concessions to enemies during war time depends very largely upon the general law governing the treatment of enemy private property, a matter more controversial than ever since 1914. If it be held that enemy property, including property such as public debts which can rely upon specific promises, is generally subject to confiscation, certainly concessions are not exempt. If confiscation is regarded as unlawful in other cases, it might still be argued that concessions are in a weaker position because they concern the exercise of functions connected with public interest. The same argument may be advanced with regard to mere sequestration, which might be forbidden with regard to tangible property and debts but valid in the case of concessions. The risks of enemy concession holders are not restricted to the duration of the war itself, for, as the last war has shown, their own state may be forced to sacrifice their rights in a peace treaty.

Neutral concessionaires should not be affected by the war, except to the extent that during a war the exercise of the concession is somewhat more likely to meet with varying degrees of disapproval in the grantor country and therefore give rise to lawful or unlawful attempts at cancellation.

The most complicated problems of legal protection arise after territorial changes. The principle to be followed in cases of state succession is highly controversial especially since the war of 1898 between the United States and Spain and the British conquest of South Africa in 1900. It would seem that even in the absence of treaty stipulations providing for their maintenance concessions, unless of a particular character, should not be canceled without compensation; on the other hand, the successor state should not be bound by the specific promises of its predecessor with regard to specific maintenance of concessions. In the case of partial loss of territory the question is even more complicated than in that of complete annexation or complete dismemberment. Two extreme opinions have been advanced: one to the effect that the cessionary state succeeds to the succession contract or other obligations of the grantor state; another to the effect that the cessionary need not respect any concessions granted before the territorial change. The question cannot be answered briefly since it involves

a number of important distinctions, such as whether complete destruction of the concessions or mere depreciation results; whether the grantor is totally or only partially transferred to a new sovereignty; and whether the successor state recognizes under its own law the type of right granted by the ceding state.

Although the term concession is not known to mediaeval law, there were many institutions in the Middle Ages which correspond to modern concessions and form the basis of later development. Acquisition of land in most cases took place under the feudal system, under which the tenant of land had obligations as well as rights. If an alien wanted to engage in agriculture he was usually dependent upon a feudal grant. Where wholesale emigrations into less developed countries took place, like the migration of German settlers into Transylvania, the Hanseatic settlements in England and Russia and the settlement of European merchants in the Levant, such settlements were sometimes endowed with special privileges. Trade and production functioned principally under the guild system, admission to which usually required special permission. In general, liberty of economic activity was the exception and special permission the rule in mediaeval times.

In agriculture the feudal system continued almost everywhere until the French Revolution, and outside of France it was gradually replaced by modern institutions between 1790 and 1848. In trade and commerce a gradual weakening of the guild system took place everywhere, but special privileges and monopolies continued and even increased in importance with the development of industry and the necessity of promoting special skill and invention by special rights. The admission of skilled foreign tradesmen and merchants was encouraged under the mercantile system. With the rise of national economic units, however, special privileges for foreign settlements became much rarer and less embracing.

Outside of Europe the settlements in newly discovered countries led to institutions which were essentially different from both the feudal and the guild systems. Individuals and trading organizations like the East India Company obtained from their home governments concessions which gave them not merely the right to trade but also to acquire land and to exercise governmental functions over this land on a basis widely different from the feudal system. The concessions were frequently granted prior to actual acquisition or conquest of the territory

involved in the concession. This new system played an important part in the development of America.

As the distinction between public and private law became more marked and as government came to be regarded as something reserved to public persons, states and sovereigns rather than to private persons, concessions of a different type became more frequent outside of Europe. These were granted not by the home government of the grantee but by the native rulers of the country and did not convey governmental rights in the same sense as the older type. They were nevertheless of great political importance, for the grantee was frequently protected by his home country and his influence and position were used as stepping stones to territorial expansion. The importance and frequency of such concessions during the nineteenth century kept pace with the general industrial development, which made acquisitions of overseas raw materials increasingly important. With the accumulation of wealth after the Napoleonic wars and the climax of the capitalistic era the extension of concessions was also undoubtedly fostered by the desire to invest surplus capital in foreign enterprises which promised high profits. As long as England was the best prepared of the European states for extensive overseas expansion and as long as competition between European states was not considerable, international concessions did not give rise to important political disputes. Nevertheless, after the recovery of France from the Napoleonic wars and the consolidation of national democratic states, the other European states began increasingly to look for overseas expansion. Concessions as important elements in this expansion thus became factors in the great struggle for the distribution of the remaining sources of wealth—a struggle which became more and more prominent toward the end of the nineteenth century. This period witnessed even a revival of territorial concessions in some places.

Oil concessions in view of their general and political importance have probably received more attention than almost any other type. Those in Mexico, Persia and Irak especially have given rise to discussion and controversy, but those in the Caucasus, India, the Dutch East Indies and various Latin American countries are also important. Not all so-called oil concessions, however, are concessions in the technical sense here adopted: they may be ordi-

nary real property or subsoil rights or private mining rights of various descriptions. The states are probably less concerned with the supply of oil in peace time than with the envisaged impossibility of obtaining it in times of war—either as a belligerent, from enemies or even from neutral countries which are not adjacent, or as a neutral, from belligerents who may need all their oil supplies for war purposes. Similar considerations govern international policy with regard to other minerals.

Rubber concessions have obtained a certain notoriety because in some countries, as the Congo State and Liberia, their exercise is usually admitted to have been connected with objectionable labor conditions. The question of rubber has also been involved in recent controversies over international restraint of trade. The controversy which centered around the Stevenson Act (1922 28), however, was concerned not with concessions but with the exercise of governmental control and private restraint of trade.

Railroad concessions have been and still are of great importance in almost all economically undeveloped countries. They have had historical importance in China, Turkey and also in South Africa. While such concessions have always been of great importance in Latin American countries, the United States has developed its railroad system partly with foreign money but almost exclusively with American skill and management. River concessions and inland navigation concessions have been numerous. The entering of harbors has been generally recognized as not needing special concessions except in portions of the Orient. Since the World War concessions for aerial transport have become of increasing importance.

With the parceling out of most overseas territories among the leading world powers and with the subsequent exclusion of foreigners the field of international concessions has been narrowed considerably. Concessions granted to foreigners remain important, however, in Russia, China, Turkey, Persia, Liberia, Abyssinia and in the Latin American states. In the more developed European countries concessions granted to foreigners have not played an important role since the last century. Recently, however, countries advanced politically and economically have been forced to admit foreign concessions and foreign management although efficient domestic management was available. This is a consequence of political pressure or more frequently

of financial need. The concession, for instance, may have been pledged for a debt or may have been given in consideration of a loan. From an economic point of view such concessions are inherently abnormal because they replace domestic management by foreign management without economic justification. International concessions are chiefly held by nationals of Great Britain, the United States and France. German expansion in this field has been partly interrupted as a result of the World War.

As many concessions were obtained from backward rulers of corrupt governments, it was possible for grantees to use questionable tactics in obtaining them. Even South Africa was not entirely free from such abuses, as is revealed by the report which the Lyttelton Commission made after the annexation by Great Britain. Concessions obtained through such means have not always been excluded from protection by the home governments of the grantees.

Complaints about maltreatment of native labor by concession holders have centered chiefly around Africa. It cannot be said, however, that such practises are a general feature of all foreign concessions. Control over the operation of concessions is inevitably dependent upon the character of the government and the checks upon it. A progressive step toward international control has been taken by the adoption of the mandate system, and the Mandate Section of the Secretariat of the League of Nations is admittedly exercising an efficient restrictive influence.

The economic and political consequences of concessions for the grantor country are essentially similar to those of foreign economic control in general. In all economically backward countries concessions are apt to promote and accelerate economic development, but foreign capitalists may not always be interested in the preservation of resources. Even an approximate estimate of economic advantages and disadvantages to the granting country would be merely hypothetical, since it is impossible to ascertain what the economic development of the particular country would have been if certain concessions had not been granted. An important concession granted to nationals of a powerful foreign state is likely to increase the possibility of foreign interference and even intervention but hardly more than in the case of other methods of economic penetration. Concessions granted to foreigners by a country which is not only economically backward but also essentially

different in its culture from the country of the grantee may affect the general social life of the granting country. They may introduce modern methods of efficiency not only in economic affairs but also, for instance, in such matters as sanitation. They may contribute to the disintegration of the native culture and change the social structure of a country by transforming a part of the population into a laboring class similar to that existing in western countries.

International concessions are, of course, potential sources of wealth and revenue for the country of the grantee. They represent, however, only one legal type of foreign economic investment and activity and therefore only one of the means of economic expansion abroad. For instance, the economic and political effects of oil interests abroad do not vary according to whether such interests have the legal form of real property rights or of concessions. The influence of concessions upon the political and economic position of the state of the grantee and upon its foreign policy can therefore be studied effectively only in connection with the whole problem of foreign raw materials, economic monopolies and investments.

International concessions will probably remain one of the legal forms of international economic intercourse as long as countries are in need of economic skill which is not available in their own country. Even increasing nationalism, while undoubtedly a restrictive influence, is not likely to lead to a total abolition of international concessions. Nor would the disappearance of the modern system of private capitalism have this effect. As long as several independent states remain in existence the economic problems may remain the same, although in a socialistic or communistic world concessions would be granted to states instead of to individuals or to private corporations. With the constant reduction of the number of backward governments the problem of controlling the acquisition of concessions will probably become less important than it was in the nineteenth century. On the other hand, whether that class of concession based on political pressure or financial need will increase will depend on world development in general. Where a backward government is replaced through conquest by a more advanced government or where territories become mandates, the problem of control is solved by the change of sovereignty rather than by any general legal restriction of sovereignty. As long as the present conception of sover-

eignty remains it will be difficult to restrict the possibility of voluntary governmental promises. The present system of international law does not hold invalid treaties which are imposed through political pressure or which have undesirable effects. It would be almost impossible to restrict the validity of promises given to individuals to any greater extent than those given to states. In so far as concessions have undesirable effects on grantor countries, limited remedy may be partly found through extra-legal means, such as publicity and advocacy of doctrines favoring the development of national culture, rather than through speedy national economic development. The most important remedy both for the protection of grantors and grantees is probably the dissemination of general legal advice with model forms for concession agreements.

Many improvements are possible in the drafting of concession agreements. The insertion of clauses providing for private arbitration would be very helpful; and as international law has not yet reached the stage of maturity, provisions for the application of equity principles in arbitration might also be suggested. Legal disputes could probably be diminished if every concession agreement contained a clear definition of the legal status of the concession, detailed provisions concerning the interdependence of the obligations of the grantor and the grantee and express provisions regarding the independent or ancillary character of auxiliary rights. Time limits are essential for all concessions which are likely to outlast the general or special conditions under which they have been granted. While stipulations concerning the possibility of cancellation may be desirable, it seems even more essential to insert repurchase clauses providing for an orderly and fair liquidation of concessions. It would probably be futile to provide for the continued functioning of enemy concessions during war time; provision should be made, however, for the maintenance of the substance of concession rights and for compensation or revival at the end of the war. If territorial changes appear likely in the region where the concession is granted, it might be desirable to minimize the public character of the concession and to shape it in a way which makes the granted rights as independent as possible of the continued validity of specific promises of the grantor or the grantor's government.

CONCILIAR MOVEMENT. The conciliar movement was the attempt made in the fifteenth century to reform the church "in head and members" through the agency of a series of general councils. It aimed at putting an end to the Great Schism, arising from the existence since 1378 of the two rival lines of popes, one Roman, the other Avignonese, and at overhauling the administrative machinery into which the system of finance practised by the Avignonese pontiffs had introduced many grave abuses. The idea that appeal could be made to a general council as an instrument of reform was no novelty. The third and fourth Lateran councils in 1179 and 1215 respectively had introduced reforms into the body of the church, and one of the objects of the Council of Vienna of 1311-

12 had been the correction of evils. But in the schism the situation was peculiar. While there were two popes, each with his own obedience, there was no lawfully constituted convening authority; and no council would be of any value in the situation unless all canonical impediments were set aside and the whole body of the church in the persons of its representatives was given the power to dispose of the papacy. Early conciliar theorists like Guillaume Durand, who in the early fourteenth century under the stress of the quarrel between the French monarchy and the pope had advocated a general council, had never been confronted with such a situation. Hence the present upholders of this plan, writing in the first days of the schism, had to urge the doctrine of utility and plead for the constitution of the councils on grounds of *epikeia*, or the equitable supervision of the rigidities of the canon law—a position that finds strong expression in the works of Jean Gerson, chancellor of the University of Paris. When Gerson assumed the chancellorship in 1395, the University of Paris had already become the center of conciliar propaganda, inspired by such men as Pierre d'Ailly and even earlier by the German masters, Conrad of Gelnhausen and Henry of Langenstein, author of *Concilium pacis* (composed in 1381; in H. von der Hardt, *Magnum oecumenicum constantiense concilium*, 7 vols., Frankfurt 1696–1742, vol. ii, p. 3 60) and of *De scismate* (composed about 1382; ed. by G. Sommerfeldt in *Historisches Jahrbuch*, vol. xxx, 1909, p. 46–61). As a result of the efforts of the university the conviction was gradually growing in Europe that a representative council was the only way of ending the schism and securing reform of the abuses universally castigated. In the early days, however, Paris itself was by no means unanimous in its advocacy of this cause. The *via concilii* had the support of the Anglo-German nation, some of the Picards and great numbers of the masters and scholars of the faculty of arts, but the three superior faculties, theology, *décrets* and medicine, were slower to be convinced. Their hesitation was not unaffected by the French king's unwillingness until the declaration of neutrality in 1399 to desert the Avignonese pope and so forfeit his schemes for extending Angevin influence in central Italy and the chance of securing promotion for Paris graduates. But later, when the patience of Christendom was exhausted and when the obstinacy of Benedict XIII and the nervousness of Gregory XII checked every at-

tempt to effect a mutual understanding between the popes with a view to their cession, the cardinals of each party were forced to concert measures for holding a council to end the schism; and their efforts were strongly supported by the Gallican church and by the rulers of France, England, Bohemia and Hungary. The result was the Council of Pisa, which assembled in 1409.

Unity and reform were its two objects. Neither was secured. Determination to make a speedy end of the schism soon led to the election of Peter Philargi as Alexander V, but since the council merely declared the two existing pontiffs schismatic without attempting to conciliate them, the result was the *condominium* of three representatives of St. Peter. Nor was reform in the church brought any nearer. The question was referred to a committee of four cardinals, who hesitated to recommend any drastic step, while the gentle Alexander himself was not equal to the task. For one thing, however, the council was remarkable: representatives of the church and of the universities spoke their minds about the limitations which might under certain circumstances be imposed upon the papal monarchy. Gerson and Pierre d'Ailly, then bishop of Cambrai and later cardinal, were each prominent in their statements of a constitutional theory for the church, and the former's *De auctoritate papae ab ecclesia* (in his *Opera omnia*, new ed. by E. du Pin, 5 vols., Antwerp 1706, vol. ii, cols. 209–24) marks a stage in the evolution of conciliar theory. For nearly five years after the Council of Pisa there was a pause in conciliar activity. Alexander was succeeded in 1410 by the military-minded John XXIII, who had no desire to see the triarchy ended by a general council. But ironically enough it was his own dangerous position in the political struggles of Italy that ultimately led him into the assembly which cost him his tiara. In June, 1413, he was driven from Rome by Ladislaus of Naples and had to seek the support of the Holy Roman emperor Sigismund. The price of German assistance was the gratification of Sigismund's idealistic leanings, the summoning of a council to end the confusion in the church, to effect a thoroughgoing reform and—here Sigismund's own political interests coincided with his orthodoxy—to deal with the Hussite movement in Bohemia. These were the three objects of the Council of Constance, which convened on November 5, 1414, and closed on April 22, 1418. "So foxes are caught," was

John XXIII's remark as his calvarie came within sight of its meeting place.

Representation at the Council of Constance was almost universal. No less than 83 princes sent ambassadors; and besides 33 cardinals there were 47 archbishops, 145 bishops, 132 abbots and 361 doctors of civil and canon law, with 1400 ordinary masters of arts and licentiates. With so heterogeneous a composition, with so many different purposes and cross purposes seeking fulfilment, questions of internal organization, particularly the order of business and the method of voting, assumed immediate and fundamental importance. If heads were counted, the reactionary party might win and John XXIII might simply remove his opponents and ignore the question of reform. Such an outcome was hardly in keeping with the plans of the French leaders like d'Ailly and William Fillastre, the dean of Reims. Their program was essentially that expressed in d'Ailly's *Capita agendorum* (in H. von der Hardt, *Magnum* . . ., vol. i, pt. ix, p. 506-36), which called for a complete reformation in head and members, and they were not to be satisfied with the restoration of unity in the person of a notorious reprobate. Hence, when the English delegation led by Bishop Robert Hallam of Salisbury and supported by the Germans suggested that the system in vogue in the universities should be adopted and that voting should be by nations, the French fell in with the plan and the papalist Italians were outnumbered and acquiesced. This deprived the cardinals of effective influence. Envisaging the result John XXIII publicly professed his willingness to quit the papal chair but in March, 1415, secretly escaped to Schaffhausen. The unequal battle between the cardinals, anxious to preserve their right of election, and the conciliar liberals, determined to procure John's abdication, continued until John was finally deposed. Shortly afterwards Gregory XII resigned and in July, 1417, after prolonged efforts to secure his voluntary abdication Benedict XIII, the pope "from the land of good mules," was at length pronounced schismatic and heretical. The following November unity was achieved by the election of Cardinal Oddo Colonna as Martin V.

The other problems before the council concerned heresy and reform. Bohemian nationalism had for some years blended with an evangelical movement centering in the Altstadt at Prague and strongly though not exclusively influenced by Wycliffite doctrine, which aimed

at curtailing the wealth and luxury of the largely German hierarchy in Bohemia and at the popular exposition of religious truths in the vernacular. The leader of this ecclesiastical fundamentalism, if it may be so termed, was John Huss, who had been excommunicated and in defiance had appealed to a general council in order to vindicate the principles of Wycliffe. Huss was granted a safe conduct by Sigismund but soon after his arrival in Constance was arrested and charged with three main heretical positions: with denying transubstantiation; with teaching that the validity of the sacraments depended on the moral character of the priest; and with holding unsound views on the nature, discipline and organization of the church. Judged by the standards of the day his trial, which lasted from December, 1414, to July, 1415, was by no means unfair; but Huss could never yield to orthodoxy and so had to be publicly burnt. His death aroused the fiercest national passion in Bohemia, which was further exasperated by the council's similar treatment of the Bohemian nobleman, Jerome of Prague, who had championed the Bohemian party against the Germans in the university. "The Gospel which we have," said Luther, "has been paid for by the blood of Huss and Jerome." These acts aroused no controversy in the council, but the problem of reform was more contentious, and it is here that the influence of national politics upon that body is clearly marked. All the delegations were convinced that the luxury and expense of the papal court must be reduced, that something had to be done to diminish papal taxation, whether in the form of annates or of *servitia*, and that the volume of papal reservations, swelled by the successive enactments of the Avignonese popes, must be curtailed. Some progress was made by the first commission of reform in 1415-16, but the death of Bishop Hallam (in September, 1417) and the bitterness between the French and the English—the result of Sigismund's anti-French alliance with Henry V in the Treaty of Canterbury, made while the emperor was on his propaganda tour on behalf of the council—weakened English interest in reform. In consequence national animosities, increased by the accession of the Spanish to the council in 1417, worked with the complicated nature of the whole financial problem to prevent the formulation of any detailed conclusions. Only the famous five decrees of October, 1417, were promulgated, the first of which, *Frequens*, ordained that a general

council should be called five years after the dissolution of the Council of Constance and should be followed seven years after its close by a second; thereafter councils were to be held every ten years. Reform was left to the new pope, and certain specified recommendations were made to him. Martin v, however, was content to pass the inadequate decrees of March, 1418, and to make a series of concordats with the principal powers, involving for the most part his recognition of the actual status of papal finance in the various countries, along with certain modifications in favor of national demands for the reform of abuses in the central bureaucracy. The fact was that in their relations with the Avignonese papacy the principal countries of Europe had evolved a technique of mutual agreement and compromise which their rulers did not wish to upset. In the collation of benefices England had already secured much of what she wanted through the Statute of Provisors of 1390, and in the Ordinance of 1407 the seeds of Gallicanism had been sown in France. But in the realm of political theory the decree of April 6, 1415, to the effect that the council constituting and representing the Catholic church held its power immediately from Christ and could claim the obedience of every rank and dignity, papal included, is of fundamental significance.

The result of the Council of Constance was a papacy more hardened and ultramontane than before. Martin's relations with Archbishop Chichele of Canterbury, with James I of Scotland and with Portugal show that he was no reformer, and the publication of rules for his chancery perpetuated many of the abuses of the past. The council of 1423, convened at Pavia but adjourned to Siena on account of plague, he never took seriously, and the poor attendance gave him the opportunity to dissolve it. It was left to his successor Eugenius IV to face the situation caused by the failure of the church to suppress the Hussites in Bohemia and by the rising anxiety of Europe as a whole on the score of clerical abuses. The theory of popular representation in church matters was growing: universities like Cologne and Heidelberg were now centers of conciliar theory, and with the religious revival in northern Europe known as the *devotio moderna* a greater desire for regeneration was making itself felt.

The Council of Basel, which was in session from 1431 to 1448, gathered up these aspirations and seemed the great chance to induce a society,

monarchical to the core, to return in spirit to the federal days of the early church. In constitution this assembly was more democratic than that of Constance. Voting went by committees, over which members of the various national delegations were equally spread, and the influence of the hierarchy was largely reduced, since the lower clergy had seats and voted. The stages in the life of the council were three. It was at its finest and most influential in the first phase (1431-34), when it was fighting under the presidency of Cardinal Giuliano Cesarini for its very existence against the determination of Eugenius IV to dissolve it. In this first stage the doctrine of conciliar government in the church received fundamentally important expression in the *De concordantia catholica* of Nicolas of Cues, later bishop of Brixen and cardinal (in his *Opera*, Basel 1565, p. 683-825). In this work, which helped to lay the foundations of liberal theories of sovereignty, he argued along truly mediaeval lines that the church was an organism and by implication did not consist of monarch and subjects, that the papacy was an administrative function only and could not contradict the decrees of the whole church assembled in the persons of its representatives. Against the fulminations of Eugenius the council held firm and acquired general prestige and admiration by its patient handling of the Bohemian situation and its invitation to the Hussites to state their case in public debate at Basel. But its early victory was thrown away by the extreme tactics of the French delegation under the leadership of Cardinal Louis Aleman, and in the second phase (1434-39) Eugenius was able to undermine the allegiance of many important persons and finally to drive the exasperated radicals into false steps which alienated Cesarini and thus deprived the council of its greatest moral force. Important among these blunders were the determination of the French radicals to secure upon French soil a meeting place for the prospective council which was to seek unity of the eastern and western churches and the council's assertion of its right to grant indulgences. But even more serious was the fact, which weighed upon the side of Eugenius, that the council was trying to grasp the whole governing activity of the church and undertaking administrative tasks for which only the Curia was fitted. These considerations led Eugenius in 1437 to break with the fathers at Basel, repudiate the decrees of the assembly and finally in September, 1437, to proclaim its dissolution.

In 1439 the council replied by the citation and "deposition" of the pope and the election of Amadeus of Savoy as Felix v. Meanwhile in 1438-39 Eugenius secured the holding at Ferrara and later at Florence of a new council attended by the Greek emperor and many orthodox prelates. The Greeks accepted the western doctrine of the procession of the Holy Spirit, the use of either leavened or unleavened bread in the Eucharist and the headship over all Christendom of the Roman pontiff. This resounding victory, which, however, never became actual, enabled Eugenius successfully to defy the Basel assembly during its last phase (1439-48), in the course of which the conciliar radicals, the Italians having now withdrawn, progressively forfeited the respect of Christendom. But some work of value had already been effected. A compromise had been arranged with the Bohemians in 1436 by the compacts of Iglau, reforming decrees had been passed which forbade reservations as unauthorized by canon law and which abolished annates and limited the number of cardinals; and some of the more important of these recommendations were accepted by the king of France, Charles VII, and embodied in the highly Gallican Pragmatic Sanction of Bourges of 1438. Yet the fact remains that the council that started with the firmest resolve and the highest spiritual and intellectual preparation broke up largely on account of jealousy between the Italian conservatives and the French radicals, the emperor Sigismund while he lived being unable by the force of his personality or advice to hold them together.

The conciliar movement restored unity but failed to reform the church. Of the highest interest as an experiment in international government, it served to show the weakness in practise of a representative system when matched against the centralized control of an absolute monarchy in fifteenth century Europe. It foundered upon the rocks of papal finance and national antagonism. Even Gerson was subject to patriotic irrelevance when he sought at Constance to secure the condemnation of Jean Petit's theories, while such a ruler as Henry v regarded the council merely as a useful place for ventilating his grievances against France. But the conciliar leaders did their utmost to secure peace and order in European society, and although they were not successful they gave an immense stimulus to the ideas of liberal constitutionalism which came later to the fore in

Europe. In many ways the movement acted as the seed bed of liberalism.

CONCILIATION, INDUSTRIAL. The term conciliation is frequently used as a synonym for mediation. Properly speaking, however, mediation is a passive act of intervention between disputants by a third party, whereas conciliation represents an attempt to reconcile the disputants and bring them into agreement. A mediator is a go-between performing messenger service for the parties in dispute. He imposes neither his will nor his judgment upon the parties. A conciliator, on the other hand, makes suggestions and offers advice on the controversial issues. The term conciliation is sometimes also used as a synonym for direct negotiation or collective bargaining. Both mediation and conciliation are in sharp contrast with arbitration, which occurs when the differences in dispute are submitted to an outsider whose function is to render an award. Successful arbitration has, however, generally emphasized conciliation both as a means of arriving at the essential facts in a dispute and of preparing the minds of the contestants for the decision or award. In fact, mediation, conciliation and arbitration may all be used in the course of a single dispute between workers and their employers. The breakdown of joint negotiations may lead to mediation and conciliation, and their failure may lead to arbitration. Not infrequently the same person or group of persons serves successively as mediator, conciliator and arbitrator, although in theory the conciliator disqualifies himself as arbitrator by having made positive suggestions for settlement which were not accepted. Although mediation, conciliation and arbitration are generally thought to be performed by outsiders or neutral parties, both mediation and conciliation are frequently carried on by the interested parties themselves. In fact, most collective agreements between trade unions and employers provide for the joint adjustment of differences by conciliatory methods and in many instances provide for arbitration only if conciliation fails. As a rule legislative provisions for mediation and conciliation are accompanied by provisions for arbitration.

The machinery for the settlement of labor

difficulties, whether created by agreement within the industry or by legislative enactment, is concerned with one of two types of disputes: differences over the interpretation of an agreement or differences over the renewal of the agreement. This machinery is either temporary, created for a specific dispute, or is permanent. Most governmental conciliation machinery is permanent, although provision is frequently made for the appointment of special conciliators to settle particular disputes of national importance. The degree of compulsion connected with conciliation varies from optional conciliation, under which the disputing parties are free to accept or reject proposals to meet for the settlement of differences and may decline the proffer of good offices by a third party, to compulsory conciliation, under which conciliation must be tried before a strike or lockout may occur.

The French *conseils de prud'hommes* were probably the earliest of modern bodies for the conciliation of labor disputes. Prior to the French Revolution there were boards of conciliation associated with the guilds which settled disputes arising over guild matters. When Napoleon visited Lyons in 1805, the silk manufacturers petitioned him for permission to reestablish some form of conciliation machinery for their trade. As a result, the first *conseil de prud'hommes*, or council of experts, was set up in Lyons in 1806, and soon after others were established elsewhere in France. At first there were no employees on the councils, but by 1848 their membership consisted equally of workers and employers. They were empowered only to settle individual, not collective, disputes and were restricted to manufacturing industries. Each council had two sections: one sat every day for two hours for conciliation purposes; the other, which met less frequently, arbitrated unsettled issues. France did not provide for the conciliation of collective disputes until the passage of the Voluntary Conciliation and Arbitration Act of 1892. Councils were established along the Rhine during the period of Napoleon's control, and when the French withdrew the councils remained and spread to other parts of Germany. Beginning about 1810 they were also established in Belgium, where, however, they never became as important as in France.

In Great Britain, although a few scattered short lived boards of conciliation with equal numbers of employers and workers existed locally in such industries as pottery, carpets and

silk as early as the eighteen thirties and forties, the first permanent board of conciliation was established in 1860 through the efforts of A. J. Mundella in the hosiery and glove trade of Nottingham. This board, which was made up of eleven masters and an equal number of operatives, was inspired by the example of the French *conseils* and existed for more than twenty years. Another famous board was established four years later through the efforts of Sir Rupert Kettle in the building industry at Wolverhampton. Whereas the Mundella board soon became a true board of conciliation, the Wolverhampton body added to the functions of conciliation the institution of a permanent arbitrator. These two bodies became models for many others established in Great Britain in the succeeding years. Legislation enacted by Parliament in 1824, 1867 and 1872 to promote the conciliation and arbitration of disputes was ineffective. Nevertheless, the Conciliation Act of 1896, which empowered the Board of Trade to investigate the causes of a dispute and to appoint mediators, conciliators or arbitrators, led to a widespread use of conciliation.

Effective legislation to promote the settlement of industrial disputes in the United States was first enacted in 1886 by the legislatures of Massachusetts and New York. The public boards which were set up in that year and those established later in other states settled many labor disputes by mediation and arbitration. Conciliation had already been practised without governmental aid for a decade or more in the coal and iron industries. But perhaps the most significant early American private conciliation system, outside the coal industry, was inaugurated in 1891 by an agreement between the International Molders' Union and the Stove Founders' National Defense Association. Since that year disputes have been settled by conferences between the officers of the union and the employers' association, and no strikes have occurred.

Provisions for conciliation and mediation have been greatly extended and are at present in operation in many countries. In addition to its long series of provisions beginning in the last century for the settlement of railroad labor disputes, the United States has also established conciliation machinery for other industries. The act of 1913 which created a federal Department of Labor empowered the secretary of labor to appoint commissioners of conciliation. The men and women attached to the

conciliation service are trained in the technique of handling industrial disputes and are appointed to extend their good offices when disputes arise. They adjusted 70 percent of the 9098 disputes which they handled from 1914 to 1929 and were completely unable to adjust only 9 percent. This record shows, however, nothing of the quality of the settlements. These conciliators, like most conciliators, have generally been much more interested in securing an agreement peacefully than in the permanency or the justice of the agreement. About two thirds of the states have provisions for the promotion of mediation and arbitration.

Great Britain's Conciliation Act of 1896 has been supplemented and practically superseded by the Industrial Courts Act of 1919, which facilitates settlement by mediation and conciliation as well as by arbitration. In France the jurisdiction of *conseils de prud'hommes* was extended in 1907 from manufacturing to other industries. However, the *conseils* have been unequal to many problems of modern industry largely because they may only handle disputes arising out of existing contracts. The committees which operate under the Voluntary Conciliation and Arbitration Act of 1892, however, may take up other classes of disputes and have become of increasing importance. Under this act either party to a dispute may request a local *juge de paix* to appoint a conciliation committee; in case of a strike or lockout the *juge de paix* may take the initiative. If no agreement is reached, an arbitration court consisting of an equal number of employers and employees may be set up at the request of either party. If this machinery also fails, an umpire may be appointed if the disputants wish it.

In Germany the old system of conciliation was done away with by the order of 1923, which provides for permanent conciliation boards and state conciliators whose principal duty is to cooperate with the employers and employees in making collective agreements. They may intervene in a dispute on request of either party or on their own initiative. First they must attempt conciliation; if they fail in this the dispute must be submitted to a conciliation chamber consisting of the impartial chairman of the conciliation board and two representatives each of the employers and employees or to a chamber consisting of the conciliation commissioner and an equal number of representatives of the employers and employees appointed by the commissioner. If no agreement is reached, the

chamber must make a proposal which if accepted by the two parties has the validity of a collective agreement. If the proposal is rejected it may under certain conditions be made legally binding by the state conciliator or federal minister of labor. Disputes arising out of the interpretation of collective agreements are now largely handled by the labor courts. The local labor courts settle a considerable proportion of their cases by methods of conciliation.

Labor inspectors in Poland serve as mediators in many disputes. Norway, which had a system of compulsory arbitration from 1915 to 1923, has also had since 1916 a system of compulsory conciliation under which public conciliators are empowered to call disputants into conference before a stoppage of work may legally take place. In Denmark, if preliminary attempts at conciliation fail, government conciliators are authorized to draw up recommendations for the settlement of the dispute. The recommendations may be published after answers have been received from both parties. Governmental mediation and conciliation machinery exist in a number of other European countries, including Sweden, Finland, the Netherlands, Austria and Switzerland. Effective work for terminating controversies has been done in Canada in connection with its system of compulsory investigation and postponement of strikes under the provisions which require the boards of investigation to attempt the mediation of disputes.

Conciliation as well as compulsory arbitration has since 1895 been part of the New Zealand system of adjusting industrial disputes. Conciliation has been especially effective since the passage of legislation in 1908, and in recent years conciliation councils have settled the vast majority of New Zealand's industrial controversies. In Australia there has also been a growing demand for more conciliation and less arbitration. The Commonwealth Conciliation and Arbitration Act was amended in 1928 and considerably extended the scope of conciliation. It provided for the appointment by the chief judge of the arbitration court of conciliation committees composed of equal numbers of employer and employee representatives and a chairman with no vote. If an agreement is reached it has the force of an arbitration court award; if conciliation fails the matter must be settled by the ordinary arbitration machinery. Queensland and New South Wales have similar conciliation provisions. Governmental conciliation has also been recently adopted in the Orient

as a result of growing importance of industrial disputes. Japan's Labor Disputes Conciliation Act of 1926 provides for the establishment of conciliation boards as controversies arise. In 1929 British India and China passed legislation for industrial conciliation and in addition the latter country provided for arbitration.

A relatively recent type of conciliation is that connected with organizations of workers employed by a single firm. Such organizations, variously called works councils, shop committees or company unions, may or may not be associated with independent trade unions. In Germany, where they are fostered by specific legislation, and in Great Britain, where their establishment has been promoted by the Ministry of Labour as part of the Whitley Councils plan, they are directly associated as a rule with trade unions. In the United States, on the other hand, they are not affiliated with trade unions and are bitterly opposed by them. Among the various functions of these plant committees is that of representing the workers in the adjustment of disputes with employers.

Far more important agencies of conciliation are those set up as part of the ordinary machinery of collective bargaining with trade unions. Trade agreements in many countries, particularly in Great Britain and the United States, contain provisions for the joint adjustment of grievances arising during the life of the agreements and for negotiating new contracts at their expiration. The systems of adjusting disputes in the anthracite and bituminous coal industries and in the men's clothing industry in the United States are especially well developed. In the former the procedure has been for disputes arising over the interpretation of an agreement to be referred to a pit committee representing the men at work in the mine. This committee consults with the mine boss. If no settlement is reached, the dispute is taken by the president of the subdistrict miners' union to the mine superintendent, and if the dispute still remains unsettled it is referred in writing to the state officials of the union and the officers of the operators' association. Provision is made in some states for arbitration if these fail to agree.

In the men's clothing industry disputes are first considered by the shop chairman, who is an elected representative of the workers, and the foreman. If not settled they are referred to a union deputy, whose entire time is given to the adjustment of grievances. He confers with the official handling labor relations for the firm,

and if no agreement is reached the dispute is submitted to a board for arbitration. Formerly the board consisted of an equal number of representatives from both sides and a permanent impartial chairman. At present the impartial chairman acts as sole arbitrator. His work consists chiefly of mediation and conciliation; only the most obstinate cases are submitted to formal arbitration. There is also a rarely used provision for an appeal from the decision of the impartial chairman to a higher board of arbitration. In both the mining and clothing industries there is additional machinery for making trade agreements through joint negotiations.

In conciliation the attitude of the contending parties is a significant determinant of procedure and results. When an agreement is sought through the method of conciliation rather than through arbitration it frequently indicates that neither side believes that an impartial umpire can be found. It also means that both sides prefer to avoid open conflict, at least for the present, but that at the same time neither party cares to surrender any of its bargaining strength. Both sides are aware of the possibility of resorting to a strike or lockout. Therefore, whether conciliation is being carried on by the parties to the dispute alone or with the aid of an outside conciliator, the relative bargaining strength of the rival parties is of outstanding importance. In fact, a large proportion of all types of conciliation, especially when no outsider is present, is nothing more than formalized collective bargaining. Each side in conciliation is likely to take an extreme position as a trading point and to recede from it only under pressure. This is particularly true when conciliation is resorted to but occasionally. Moreover, the type of leadership has much to do with the attitude taken during conciliation. At the outset, in any arrangement providing for conciliation, the parties are distrustful and are disposed to take hard and fast positions. Sometimes the provisions for arbitration in case of failure to agree accentuate this attitude because it appears to be easy to shift responsibility to the arbitrator, whose decision may be freely criticized by each side. Nevertheless, as the leadership becomes more experienced there comes a realization of ultimate responsibility and a tendency for each side to carry the burden of decision. The seasoned and well trained leader can see both sides of a situation. Conciliation may thus become a means of jointly considering the needs

of an individual concern or of an entire industry. Naturally with this larger consideration the likelihood of an arbitrary stand on petty differences becomes very remote. It does not necessarily mean, however, that either side will surrender basic principles.

Conciliation appears to be especially effective as a method of settling disputes when it is carried on by means of permanent machinery. There comes to be a day to day balancing of forces which avoids the shock of occasional adjustment. Frequent contact between the two parties tends to promote mutual understanding and the possibility of peaceful relations in the future. Since joint negotiations are not always successful, however, a mediator is often capable of performing a valuable service by bringing the two sides together again for further conferences. Sometimes, by acting as a confidential intermediary, he may learn what each side will concede and may thus find common ground for an agreement. Often, because of the esteem in which he is held by the disputants, he may secure concessions which neither would grant to the other in his absence. An able conciliator frequently finds a basis of agreement which has remained undiscerned by the contesting parties. Tact, insight and the ability to inspire confidence appear to be the most valuable qualities of a good conciliator. Often his most important duty is to find a formula which will permit the contestants to accept a compromise and still retain their dignity and the confidence of their constituents. The conciliator's efforts are most likely to be successful if he is familiar with the trade or if he is a person of eminence in the community.

Arbitration through a permanent umpire or impartial chairman is generally associated with a system of conciliation and mediation. During the early years of the agreement in the men's clothing industry in the United States, for example, there was frequent recourse to formal arbitration by the impartial chairman. As a result a body of rules and precedents was established which has for some time been well known to the representatives of both sides. By studying the decisions of the arbitrator it is often possible to know in advance what kind of opinion is likely to be rendered in a given instance. Since both sides are aware of this the settlements by conciliation become more numerous. When the umpire has continued in office for a long time there is an increased demand for his services as adviser. Thus in time disputes in the industry

come to be settled more and more frequently by conciliation and mediation and less frequently by arbitration. Yet the existence of formal arbitration machinery is desirable for use as a last resort in case other methods fail to bring about a settlement. Furthermore, the dignity of arbitration proceedings helps to maintain discipline and respect for the trade agreement among both workers and employers.

Successful conciliation tends to strengthen trade unionism. In industries in which the workers possess no form of organization, conciliation must almost of necessity be confined to the grievance of an individual worker. Where the workers belong to shop committees established by employers, conciliation is generally confined to minor issues and the workers' bargaining power is weak. Full fledged conciliation is not likely to exist in the absence of independent trade unions. Just as the existence of trade unions generally results in machinery for conciliation, so the practise of conciliation in turn promotes unionism. Conciliation may result in the standardization of wages and conditions throughout a trade. Both the union and the organized employers, feeling the pressure of competition from the unorganized section of an industry, are likely to join in the effort to extend organization. Such efforts to extend the field of conciliation in order to standardize conditions have, when successful, resulted in the growth of unions. Their failure has occasionally resulted in the decline of unions. The regular utilization of conciliation machinery, besides strengthening the industrial status of trade unions, tends to make them more conservative in their conception of industrial problems and less aggressive in their actions. A union can hardly remain militant if it ceases to push its program beyond what it can obtain through conciliatory compromises with employers and if it gives up the use of strikes and other forceful methods. Both aggressive unions and employers accept conciliation when they are weak and resort to strikes or lockouts or threats to use force when they are strong.

The relative effectiveness of conciliation, mediation and arbitration in adjusting labor disputes is indicated in part by the following examples. From 1901 to 1925 inclusive, 4382 disputes were reported to the authorities of New York state. Of this number 41 percent were adjusted by means of conciliation (direct negotiation), 15 percent by mediation, 2 percent by arbitration and the remaining 42 percent

were deadlocked or otherwise ended. From 1910 to 1924 inclusive, 72 percent of the labor disputes in Great Britain and northern Ireland which involved the cessation of work were settled by conciliation (direct negotiation), 8 percent by other forms of conciliation and by mediation and 6 percent by arbitration. Eight percent were ended by the return of the workers on the employers' terms without negotiations and the remaining 6 percent were terminated by other methods. These data bear out in general the results of many other investigations. Experience in all countries would seem to indicate that although none of this machinery can of itself remove the causes of industrial conflicts, industrial peace is more likely to prevail where emphasis is placed on negotiation and conciliation rather than on arbitration as a means of adjusting industrial disputes.

CONCLAVE. See PAPACY.

CONCORDAT. The term concordat, which denotes any agreement, has come to be applied more specifically to an agreement entered into by a state, on the one hand, and the pope as head

of the Roman Catholic church, on the other, with a view to adjusting unusual conflicts of authority not amenable to ordinary political or ecclesiastical laws and ordinances. Such compacts may be negotiated with an equal degree of validity either at the Holy See or within the domain of the contracting state, the church being represented either by the papal secretary of state, the papal nuncio or a plenipotentiary extraordinary; the state by its permanent representative at the Vatican, its minister of foreign affairs or a special ambassador.

In countries where evangelical churches are predominant adequate means of establishing a demarcation of authority between church and state have usually been found without recourse to the device of the concordat. But in Catholic states, where the strength of the church organization has been conducive to misunderstandings between the civil and ecclesiastical powers, it has frequently been resorted to. In 1107 an agreement was signed in London which may be said with some justification to constitute the earliest use of the concordat. The Concordat of Worms, concluded fifteen years later with the German emperor, is more customarily cited as the original pact of this kind, although it consisted of two simultaneous acts, one by the pope and the other by the kaiser, instead of the single instrument, signed by both parties and constituting an express contract, which later became the more familiar type. The concordats with France in 1516 and 1801 are particularly significant, as well as that with Bavaria in 1817. Those with Austria in 1855 and Ecuador in 1862 are notable, despite their short duration, for the especially generous concessions made to the church. Since the World War such agreements have been made with Latvia (1922), Bavaria (1924), Poland (1925), Lithuania (1927), Portugal (1926), Italy and Prussia (1929). There has been evidenced recently, however, an increasing objection from certain quarters to the use of the term concordat because of its identification with a device which over a course of centuries has conferred upon the church such extensive privileges.

These privileges have taken a variety of forms. A concordat may grant state recognition exclusively to the Catholic church, which is thus given complete spiritual authority, if not over all citizens, at least over its own members. Likewise the state may concede the binding force of canonical laws, particularly those which result in restriction of marriage between Catholics and non-Catholics. Priests may be accorded among

other privileges freedom from military service, and bishops a seat in the upper house in Parliament; while at the same time the state may disavow any right of interference with the church's maintenance of celibacy. A concordat almost invariably contains articles concerning the influence of religion or church officials on civil laws and institutions and, more specifically, concerning church influence in state schools. Moreover, the state may grant subsidies to parochial schools and thus assumes many financial responsibilities. It may make grants of land to the church, regular payments to bishops and chapters and contributions to the salaries of the clergy.

On the other hand, as compensating concessions to the states there are usually articles establishing the degree of allegiance owed by the church as well as the extent of civil participation in or supervision over internal ecclesiastical administration. Loyalty to the state has been stimulated by inserting into the church services prayers for temporal rulers, by exacting of bishops and priests an oath of allegiance to the government in power and by excluding from the ranks of the priesthood within a state any citizen of another state. When the establishment of orders and congregations has been subjected to ratification by the state, when there was in France a right of appeal from ecclesiastical to civil courts and when the promulgation of papal decrees within a state has been contingent on that state's permission, concessions of this latter type have not been made in concordats; but the pope has admitted even in the latest concordats that church appointments are open to influence by the state—at least to the extent that the nomination of a bishop may be objected to on political grounds. Moreover, the state in order to safeguard its rights against unfavorable interpretation of ambiguities in the concordat itself, has often added, against the protest of the church, explicit clauses, such as the Organic Articles of Napoleon, or made explanatory statements, as did Mussolini after the Concordat of 1929.

In an attempt at compromise the parties negotiating a concordat often include articles which each points to as concessions to the other, but which in reality confer certain advantages on both. An article, for instance, which provides for the teaching of the Catholic religion in state schools, whether through the agency of clerical or lay instructors, might well be considered a concession on the part of the state, since even in

the latter case there is presented to the church the opportunity of increasing its influence in the training of government teachers. Yet at the same time the article confers an advantage on the state, especially if the instruction is in the hands of state teachers, in that it is thus enabled to exert an influence on religious education and on the spirit of the church.

Contradictory theories of political philosophy as to the primacy of the temporal and spiritual powers have resulted in conflicting conceptions of the legal character of the concordat. The mediaeval "theory of privilege," which assumes the supremacy of the spiritual and the ascendancy of the pope over all princes, holds that the church in surrendering through the concordat certain rights to the state has made concessions which it may at any time revoke. The "theory of the civil law," on the contrary, holds that the power of revocation is peculiar to the state, since as the source of all rights it alone can be said to have granted concessions. Thus in France in 1789 and in 1905 the state acting on this theory abrogated the existing concordats and arbitrarily interfered with ecclesiastical life. A third theory, that of "contract," conceives the church and state as equally privileged parties. Even this theory, in spite of its wide acceptance at the present time, is contested, especially by upholders of the "theory of the civil law" and by jurists, who are skeptical concerning the legality of the concordat as an international compact, since one party to the agreement is not a sovereign state. Such an attitude, however, may be said to be unrealistic when it is borne in mind that few sovereign states today would hesitate to conclude compacts with powerful international economic organizations. There should, accordingly, be even less hesitation to negotiate enduring compacts with an international spiritual power such as the Roman Catholic church. Not infrequently, of course, concordats have led to renewed conflict and been abrogated, but, granted a mutual desire for peace, the concordat may still be a very useful *modus vivendi* amid the strained relations which still exist between the Catholic church and modern states.

Consult: Texts of the older concordats are found in *Raccolta di concordati*, ed. by A. Mercati (Rome 1919), and of the more recent ones in *Acta apostolicæ sedis*, published monthly in Rome since 1909. For the Catholic side of the question see Ojetti, B., "Con-

cordat" in *Catholic Encyclopedia*, vol. iv (1908) p. 196-203; Bierbaum, M., *Das Konkordat in Kultur, Politik und Recht* (Freiburg i. B. 1928). For the Protestant side see Mirbt, C., *Das Konkordatsproblem der Gegenwart* (Berlin 1927).

CONCUBINAGE might be described as marriage dissociated from juridic functions, more particularly in regard to property and succession. The relation is, except in regard to the latter aspects, almost as clearly distinguished from casual and fleeting sex relations as is marriage. The definition, connotation and status (legitimate or illegitimate, approved or reprobated) of concubinage depend necessarily upon the juridic conditions by which marriage is defined, and these vary widely in different cultures. Where these conditions are undeveloped no distinction exists between concubinage and marriage, as has been the case in many lower cultures and in some which are relatively advanced, as in ancient Japan. The distinction found in some lower cultures (Australians, Alfurs) between class rights of sexual access (group marriage) and individual economic marriage does not properly come under this head.

Unions in the contracting of which tribal customs have not been observed are even in the lowest cultures branded as illegitimate. Thus in matriarchally organized societies the removal of the woman to the man's home is condemned and resented and the union is regarded as invalid unless an adequate indemnity is supplied, but in patriarchal societies marriage which follows matriarchal usage (e.g. *al-motah* in Arabia) is in like manner reprobated as immoral. In many cultures (e.g. the Polynesian), the juridic economic functions of marriage being applicable only to the ruling and propertied classes, their alliances alone are treated as marriages while the bulk of the population are said to live in concubinage. The expenses of customary marriage celebrations are sometimes so great that they are dispensed with or indefinitely postponed by the poor, as is commonly the case among the peons of modern Mexico, who rear families in concubinage. While the relation of concubinage may be a substitute for regular marriage where juridic, economic or other obstacles preclude the latter, the term may also be applied to secondary unions contracted conjointly with regular marriage. Among many warlike tribes of low culture (Carib, Tupi) the position of women captured in war is clearly distinguished from that of ordinary wives as one of concubinage.

Among others, however (Amerinds, Polyne-sians), captured women are usually adopted into their captors' tribe and married in the same manner as other women. Purchased slaves occupy a similar position to that of war captives, and concubinage with bondwomen has played an important part in many cultures by the side of marriage. Sometimes, where matri-archal succession still obtains (T'argi, west Afri-cans), concubinage is particularly favored by the men as a means of evading matriarchal law and of transmitting their property to their own sons.

The extensive practise of the latter forms of concubinage has often had important racial effects, as among the Jews, the Berbers and the Turks. Likewise the tolerated concubinage of Europeans with native women in foreign countries has brought about races of half breeds. In the southern states of America, owing to the severity of the laws against it as well as the force of racial sentiment, concubinage with **Negresses** was seldom acknowledged and ap-pears to have been rare among slaveholders and confined for the most part to the lower orders of white workers. Concubinage with native Indian women, although of little sig-nificance by comparison, was less uncommon than is usually supposed in the northern states and beyond the Appalachians during the seven-teenth and eighteenth centuries.

The term concubine has frequently been used incorrectly in ethnological accounts, as when it has been applied to the sisters of the wife first married, on whom the husband has a juridic right and who occupy an equal status and sometimes bring dowries of their own. So also the term chief wife has been widely mis-used to suggest a distinction in polygamous families where that distinction does not exist. In most polygamous systems special emphasis is laid, as in Islam, on the complete equality of wives. The differentiation between a chief wife, secondary wives and concubines has taken place where patriarchal succession to titles and prop-erty has acquired importance and where the social rank of the heir's mother has come to be a matter of moment. In some cultures (He-brew, Tartar, Chinese) children by secondary wives and concubines are through legal fiction assigned to the chief wife, whose position is usually due to superior social rank. A chief wife in those cultures is often interested in procuring concubines for her husband with a view to increasing her own fictitious fertility

as a breeder of heirs. Among the Semites, Turks, Chinese and Dahomeans concubines who bear children to their masters cannot be sold. Systems of juridic monogamy combined with legal concubinage, which have developed out of equalitarian polygyny, represent an im-portant stage in the transition from the latter to pure monogamy.

Concubinage, associated or not with mar-riage, was usual and general in archaic Greece and was legitimate and respected in the city-states of historical times. Marriage proper was defined by the position of the wife as a free born fellow citizen and by the property (dowry) which she brought to her husband, and thus legal concubinage was required to provide for union with a foreigner or with a freed or dower-less woman. Similarly in Rome under the repub-lic the status of a concubine was legitimate and respected although it differed from that of a wife. The latter passed into the hand (*manus*) of her husband and her offspring followed his social rank and inherited his property, while the offspring of a concubine followed the rank of the mother. Since juridic marriage was orig-inally applicable only to patricians, all plebeian unions and the union of a patrician with a plebeian were concubinage. Under Augustus the status of concubines was further protected by special legislation. The laws concerning adultery applied equally to marriage and con-cubinage. The legal relation of concubinage was thus very similar to that of morganatic mar-riage, as contracted by a prince with a commoner who is debared from assuming his rank.

While Christianity vehemently condemned all sex relations unless consecrated by indis-soluble marriage and exalted celibacy over the latter, it continued during the early centuries to sanction in practise the established Roman and barbarian usages. The celebration of mar-riage was usually dispensed with in the case of slaves and was not made compulsory even for freemen until the tenth century. Concubinage in conjunction with marriage and thus equiva-lent to polygamy continued to be common among barbarian rulers. The celibacy theoret-ically required of priests was mitigated by the virtual recognition of concubinage, the conces-sion being facilitated by the early Christian practise of cohabitation in professed continence. This practise claimed a commendable character as a "trial of chastity" but merged by a natural gradation into the habitual concubinage of priests.

The tacit toleration of concubinage did not give place to general reprobation in Catholic and Protestant countries until after the Protestant Reformation. To the legal disabilities attaching to the relation, more particularly as regards the woman, became added the ruthless penalties of social condemnation and ostracism.

From being originally as legitimate a form of union as marriage concubinage thus became first illegitimate, then illicit and immoral. The latter attitude has in some instances been reflected in legislation, as in the anomalous applications of the Mann Act and of immigration laws in the United States, whereby all unlegalized unions are juridically regarded as prostitution.

As Lecky remarked, "when public opinion, acquiescing in their propriety [of concubinate unions], inflicts no excommunication on one or both partners, when these partners are not living the demoralising and degrading life which accompanies consciousness of guilt, and when proper provision is made for the children who are born, it would be, I believe, impossible to prove, by the light of simple and unassisted reason, that such connections should be invariably condemned." The ideal of economic independence for both sexes abolishes to a large extent the juridic grounds of the distinction between marriage and concubinage. With the transference of the regulation of sex relations from ecclesiastical to civic jurisdiction and of the considerations which govern them from dogmatic to social and utilitarian grounds, an inevitably increasing disposition has developed to regard unions as rightfully entitled to social recognition and respect when they do not pledge the partners to indissolubility and have no reference to the juridic requirements for the transmission of property.

CONCURRENT POWERS is a term applied in federal structures to the power to legislate in those fields where legislative action may be taken by either the federal government or the governments of the constituent units or by both. Thus in the United States it designates those powers which have been conferred upon the United States government by the constitution, but which may also be exercised by the states in the absence of federal action or, in some cases, with the express permission of the national government. In this sense the concurrent authority of the state is always subordinate to the superior authority of the nation; it is not concurrent in the sense that it is equal in power with the nation but it is merely an authority exercisable in a field where national action may replace state action.

The exercise of state power in unoccupied fields of national authority was discussed in the *Federalist* and was recognized by the United States Supreme Court as early as *Sturges v. Crowninshield* [17 U. S. 122 (1819)]. The term concurrent power, however, did not appear in the text of the Constitution of the United States until 1919, when the Eighteenth Amendment gave Congress and the several states "concurrent power" to enforce the prohibitions as to intoxicating liquors. The language of the Eighteenth Amendment would imply some equality of power between state and nation, but there is little doubt that in case of conflict national authority would control, for it is aided by another constitutional provision establishing the supremacy of the laws of the United States. Yet it seems equally clear that Congress cannot altogether exclude the states from action in the field of prohibition. Nation and states may each, "without interference by the other, enact laws to secure prohibition, with the limitation that no legislation can give validity to acts prohibited by the amendment" [United States v. Lanza, 260 U. S. 377 (1922)] Each is subject to the terms of the amendment and the legislation of one under the terms thereof supplements the legislation of the other. Here, therefore, the power is concurrent in a broader sense than that defined above. But the power over prohibition is not concurrent in the sense that both state and nation must act to give effect to the prohibition.

In a federal system there must be some device for the distribution of powers between the central or national government and the units or states and some means of keeping each within its proper bounds. The Constitution of the United States determines the powers of the national

government, and the United States Supreme Court is the primary agency for the preservation of the balance between nation and states. The constitution enumerates certain powers as belonging to the United States, confers other powers upon the national government in general terms and forbids certain state actions. A few matters are exclusively within the authority of the nation, not because they are conferred in terms of exclusion but because their character is such that they may be exercised by only one authority, either on the ground that they are related to national sovereignty, as naturalization, or that any regulation must be uniform, as in a large part of the field of interstate commerce. Others are exclusively national because they are granted to the United States and expressly forbidden to the states, such as the power to declare and make war. In only a few cases, such as legislation for the seat of government, are the powers of the United States expressed as exclusive.

Where a power is not exclusively national for any of these reasons, concurrent state power may exist so long and so far as the national government does not occupy the field. Thus Congress has power to enact a general bankruptcy law. Such laws have been in force from 1800 to 1803, 1841 to 1843, 1867 to 1878, and since 1898. In the intervals the matter lay within state legislative power. Similarly, Congress has never completely exercised its power to regulate interstate commerce; concurrent state powers thus exist over matters of interstate commerce in which Congress has been inactive and which are not deemed by the Supreme Court to require absolutely uniform regulation. But no concurrent state power may be exercised in a field of national power if the nation occupies the whole field or indicates an intention to exclude state action. Not only may the national government thus exercise its own previously dormant powers, but in doing so it may encroach upon preexisting state powers. Thus as an incident to its power to regulate interstate railroad rates Congress may regulate the rates on purely domestic state commerce, which would otherwise be under state control. The Supreme Court has, however, in the child labor and other cases imposed limitations on such a process of extension of national power.

The extent of concurrent action by the states is steadily reduced as the national government more fully exercises its powers. It was probably within the power of the states to require safety

appliances on all trains, interstate and intrastate in absence of federal action. But the United States has regulated this matter as to all cars, both interstate and intrastate, as a means of protecting interstate commerce. The state's possibility of exercising power in this field ceases as to both types of commerce when the national government occupies the field. Withdrawal of federal action would permit state action again, at least as to domestic cars and probably as to those engaged in interstate commerce, and would thus increase the scope of concurrent power exercisable by the states.

Concurrent powers also exist in other federal structures such as Canada, Switzerland, Argentina, Australia, Germany and Brazil. In the main their governing principle is that federal legislation in concurrent fields is supreme. In Canada the British North American Act definitely limits concurrent power to immigration and agriculture; in these fields the provinces may legislate even after legislation by the dominion, provided there is no conflict. In the event of conflict the provincial laws are simply inapplicable and come into force again on the repeal of the ruling dominion law. The same automatic revival of state laws exists in Australia. In Germany, on the other hand, federal legislation nullifies all state laws, even, in the opinion of some authorities, laws in harmony with or duplicating the national laws. In that country, as in Brazil, the power of the central government to extend its authority by constitutional amendments without the consent of the states makes it possible to transform any existent state power into a concurrent or even exclusive national power.

CONDEMNATION PROCEEDINGS. See EMINENT DOMAIN; EXCESS CONDEMNATION.

CONDILLAC, ÉTIENNE BONNOT DE, ABBÉ DE MUREAUX (1714–80), French philosopher and economist. Condillac, younger brother of the abbé de Mably, is famous in the history of thought as the French expounder of Lockian sensationalism. The philosophy which in a desultory way Voltaire had endeavored to popularize in France Condillac developed with the concentrated purpose of a systematic thinker. Agreeing with Descartes, whose rationalism had formed the substructure of seventeenth century French thought, that all general ideas may be decomposed into simple elements Condillac then proceeded to demolish the Cartesian postulate that such simple ideas are innate. In his most original as well as his most influential defense of sensationalism, *Traité des sensations* (2 vols., Paris 1754), Condillac went so far as to assert that all so-called intellectual processes—memory, imagination, attention, judgment and reason—were nothing more than “transformed sensations.” To explain this transformation Condillac had recourse to social experience, which created words whereby simple ideas could be first designated and then combined into general ideas. Condillac’s anthropology, depending upon the hypothesis that the theory of human nature is closely linked with the theory of human knowledge and is to be derived from individual psychology, was borrowed by the *encyclopédistes*, to a great extent by Rousseau and in a modified form by the ideologues, particularly Destutt de Tracy. Through the writings of Taine his anthropology also penetrated into later nineteenth century thought. Condillac has been criticized, however, by the modern French school of sociology for sharing with all eighteenth century philosophy the tendency to regard society as a necessary but external condition of intellectual development.

As a corollary of Condillac’s theory concerning the importance of language in the formation of ideas it followed that the necessary preliminary to the development of any science was the creation of its peculiar terminology, the definition of its principal concepts. In *Le commerce et le gouvernement* (Paris 1776) Condillac attempted to perform this task, which in his opinion the physiocrats had evaded, for the science of society or economics. Isolating, as the fundamental economic concepts, value, exchange and price he succeeded in constructing a theory of value derived from individual utility and of exchange derived from a comparison

of individual utilities which marked an important advance over the crude notions of his contemporaries. He also anticipated later critics of physiocracy by maintaining that industry as well as agriculture represented productive enterprise. But since in the main body of his economic doctrine he reiterated the theories of Quesnay he was generally dismissed as a minor or at most an erratic physiocrat, until in the latter half of the nineteenth century Henry Macleod’s enthusiastic dictum that Condillac was “infinitely superior to Smith” led to a reestimate of his contribution.

CONDITIONED REFLEX, sometimes called conditioned response, is a term which forms the doctrinal keystone of the system of psychology known as behaviorism. It designates acquired or learned reactions to stimuli as contrasted with innate or instinctive ones, which are correspondingly called unconditioned reflexes or responses. Conditioned reflex first appeared as a technical term in an essay on *The Work of the Digestive Glands* by the Russian physiologist, I. P. Pavlov (English translation by W. H. Thompson, London 1902; Russian ed. 1897), who was studying the digestive process in dogs. In the course of his experiments Pavlov had observed that the mouths of his animals “watered” under a great variety of conditions. That they should invariably secrete saliva when the food was in immediate contact with the surfaces of their mouths was expected; such secretion was a primary, direct, unconditioned reflex. But they also secreted saliva at times upon merely seeing the food, its container or the person who brought it; they secreted saliva when they heard his footsteps or his voice, felt his hand or smelt his clothes. These responses were variable, indirect, secondary; their evoking stimuli were inconstant in their effect—i.e. dependent on conditions. At the outset Pavlov recognized these stimuli as “psychic,” but since this concept involved the use of introspective analogies and ruled out experimental study and control he determined to regard the phenomena and their relations as external, to treat them and to study

them as responses varying with circumstances. Pavlov worked out a device for measuring the intensity of the response to an indirect stimulus by counting the drops of saliva secreted, which has become classic in the history of psychophysical experimentation. The American K. S. Lashley perfected a modification of this device which is applied to man. The tale of the number of drops of saliva secreted at the sound of a bell is now a part of the great tradition of psychology and the standard example of the conditioned reflex.

Overlapping Pavlov's work was that of another Russian, V. Bekhterev (*q.v.*), and that of a German, O. Kalischer. Bekhterev studied especially the defensive responses to painful stimulation of the skin; Kalischer studied motor reactions to the food reflex. Bekhterev called the conditioned responses he observed "associative," Kalischer called them "trained" or "acquired" (*Dressurmethode*). Since, however, Pavlov's work came first to the knowledge of American psychologists and provided a pat and workable first principle for the growing and important studies of animal behavior initiated by E. L. Thorndike and carried on by J. B. Watson, R. M. Yerkes and others, it was Pavlov's term "conditioned reflex" which became generally accepted in the English speaking world. It formulates the general observation that when a definite activity of the organism occurs at the same time with any external stimulus, or just after it, then that stimulus will call forth that activity another time. The indirect stimulus is a substitute, a symbol for the direct one it once accompanied or preceded and a signal for the activity that the direct one evokes.

The instruments of this substitution are the cells of the cerebral hemispheres, where all new nervous connections take place. According to C. J. Herrick in *Brains of Rats and Men* (Chicago 1926) the number of possible connections between two neurones in a human brain is 10 raised to 2,783,000 power. If this be the case both the precise determination and the endless variations of human conduct and culture may be accounted for. Determinations will follow from the specific character of the conditioned reflex; variations from the uncountable number of reflexes possible. As all learning is a matter of acquiring stable conditioned reflexes, human personality and social institutions become merely effects of conditioning, and by conditioning any ideal society or individual may be trained. "I am deeply and irrevocably convinced," says

Pavlov, "that along this path will be found the final triumph of the human mind over its uttermost and supreme problem—the knowledge of the mechanism and the laws of human nature." Watson contends that training, conditioning, should be able to develop eventually any kind of infant into any kind of adult.

CONDORCET, MARIE JEAN ANTOINE NICHOLAS CARITAT, MARQUIS DE (1743-94), French *philosophe* and revolutionary. Condorcet was born in Picardy of an old aristocratic family. His childhood and youth were spent in a society of nobles, soldiers and priests. Early in his career he became intensely interested in the political and social problems that were agitating France before the revolution; he repudiated his clerical and aristocratic ideas and became identified with the radical free thinking *encyclopédistes*. After the outbreak of the revolution he became a member of the municipality of Paris and later of the Legislative Assembly and the Convention. By temperament he was better fitted to be a "guide of opinion" than a revolutionary statesman, and his role in the Convention was at first rather futile and later pathetic. Although he was among the first to favor a republic after the flight of Louis XVI in 1791 he belonged neither to the Girondists nor to the Mountainists. He opposed the former because of their federalism and the latter because of their violence. During the Terror he was proscribed along with the Girondists and died in prison, presumably a suicide by poison.

Condorcet's intellectual labors covered nearly the whole range of the social sciences. Although not a writer or thinker of first rank he represents the synthesis of the intellectual movement in eighteenth century France. His fundamental ideas find their best expression in his most famous work, *Esquisse d'un tableau historique des progrès de l'esprit humain* (Paris 1795; Eng. tr. Baltimore 1802). The modern idea of social progress, or of the "unlimited perfectibility of man," was clearly stated and definitely de-

veloped by Condorcet. He viewed the history of mankind as a progressive evolution marked by successive stages in the advancement of knowledge and approximating ever more closely the ultimate aim of society, the achievement of absolute equality of rights—equality of the rights of individuals and equality of the rights of nations. Condorcet worked out a system of a social mathematics which would reduce the historical process to the operation of laws as “necessary and constant” as the laws of natural science. He was one of the first to proclaim the idea that the purpose of studying history was to discover these laws of social progress and through them to direct the future course and development of humanity.

In his *Essai sur l'application de l'analyse à la probabilité des décisions rendues à la pluralité des voix* (Paris 1785) he simplified probability calculus in order to facilitate its use in testing the justice of court decisions, the degree of correspondence to facts in decisions of legislative assemblies and the relative merits of electoral systems. Although he wrote much on economic problems and on politics he made no original contributions to these subjects. His discussions of political problems were in the manner of a constitutional lawyer as well as that of a political philosopher. He accepted the current views on natural rights and popular sovereignty and was a strong individualist. In his economic views he followed closely the doctrines of the physiocrats, especially those of Turgot.

Condorcet was more of a pioneer in other fields. He enthusiastically advocated woman's suffrage and the equal rights of men and women on the ground that, like men, women were “susceptible to moral ideas and capable of reasoning from them.” He also was convinced of the equal intellectual capacity of the sexes except in the highest forms of science and philosophy. Unlike his radical contemporaries he had advanced views on the family. He favored equality of husband and wife before the law, civil marriage, divorce and birth control. Like all the *philosophes* he was violently anti-religious. He regarded religion as a gigantic system of hypocrisy operated by knaves who “frighten their dupes by means of mysteries.” His hatred of Christianity flares forth in most of his writings but it is not clear whether he was a deist or an atheist. In the report on popular education which he submitted to the Legislative Assembly he recommended the establishment of a national system of free education of all grades

with coeducation, instruction in science, physical education, special schools for gifted children, moral instead of religious instruction, and schools for adults. This report was the basis of the education law passed by the Convention and was the inspiration of the succeeding educational reforms of Napoleon, Guizot, Duruy, Ferry and Buisson.

Condorcet's writings, while voluminous, did not have a popular appeal. His style was turgid and rhetorical and his thought abstract. His suggestions were, however, exceedingly fruitful to others and were of particular importance in shaping the positivism of Comte and the socialism of Saint-Simon.

CONDUCT is a general term for the relation between the human organism and its environment when this relation is looked at from the point of view of the organism itself. What an individual suffers from the environment is not conduct, but the way he bears up under it or reacts to it is conduct. In spite of the apparent specificity of stimuli the organism's career is continuous and becomes, willy-nilly, something of a piece, although at times a highly variegated piece. Conduct is, in a word, the plotted curve of behavior. The fact of the curve is determined by the inherently active nature of the organism; but the form of the curve is determined by the nature of the environment. The ancient and persisting notion of instincts as the source of conduct has at least this permanent truth, that human beings are subject to classifiable internal urgencies. Even these pressures, however, cannot be adequately described without external

reference. The quests for food and for whatever shelter is indispensable become basic determinants of the form of behavior. But it is clear that, due to the helplessness of the human infant and its differentially long infancy, it is the social environment that early plays the major role in canalizing the amorphous native impulses. The social environment sets standards and invites judgment. The most simple judgment will be general and dualistic: action that is, or is not, done; conduct becoming, or unbecoming, a lady or gentleman. But these simple moral dualisms break up easily into cultural pluralisms; and age and sex standards get diversified into class, occupational and aesthetic standards approaching complete individualization as a limit.

The degree of stratification varies between primitive and civilized cultures, though perhaps not as greatly as was once supposed. Certainly sophisticated peoples are more custom bound than they like to admit; and it may well be, as Radin and others have recently argued, that the apparent homogeneity of primitive cultures gives way to a more differentiated pattern as civilized observers become more sensitive to both their own ignorance and the anthropological data. Nevertheless, as division of labor progresses and at last eventuates in industrial society, the number of subclasses of the great groupings operates to give a fluidity to conduct unobserved in primitive society or even in strictly agricultural societies. Throughout history religion has exercised a double influence: by its emphasis upon works it has followed "the reality principle" toward diversity; but by its emphasis upon faith it has sought through a formula to "save" the individual from disintegration and at the same time to maintain by the picture of a homogeneous society in an after life the actually dissolving social unity. A society characterized by minute division of labor witnesses also the recession of the influence of such religion as emphasized the brotherhood of man here and a common home with the father hereafter—a patriarchal or early group picture; and the rise of a philosophy of life that would make possible a total reintegration of the personality of highly specialized workers would mark the moral goal of modernity. Somewhere inside the former picture and this side the latter, conduct now runs in an age of science.

The feelings that cluster about occupational and other groupings, when these feelings become ideational, serve as standards. The most general of them hang over from earlier groupings

as vague ways of sensing things, influencing overt behavior in all probability very little but making quite a difference in the tone of life: a present gentleman is ghost of a past "gentle" man, a present villain, of a past "villain." Actually canalizing the flow of energy far more than such general standards as honesty, chastity, holiness, etc. are the habits that come from overt education and conscious training. "Playing the game," "being a good sport," a "straight-shooter"—these point to the real standards of the living generation. In overt education—in school, in scouting, in church—the vaguer standards inherited from the past are always reaffirmed, but they are reaffirmed in a concrete setting that discloses what about them is possible, what merely ideal. Techniques and technologies as presenting opportunities for, and furnishing expectation of, success spell out another type of persisting pressure for the regimentation of action into conduct. The silent influence of the way people act—in distinction from what they teach—as detected at home, at school, at play, in the movies, in the press, is perhaps the greatest of all, because indirect and largely unconscious. These standards, just because they are ingrained as habit, become second nature in their dominance.

The complex standardizing process, though difficult to exhibit in brief psychological analysis, may be seen at work in historic examples. Sparta was able in an astonishing degree to ride over the inhibitions of competing desires and tendencies and to weave the energies of all its citizens into a single pattern. The silent forces of unambiguous approbation and equally unambiguous shame tended to keep the youths proud where the standard setting group thought they ought to be proud, cowed when inclined to deviate from unequivocal expectation. It is the final test of social determination of action that men think first of honor and second of liberty. The Spartan was a Spartan first and a man afterwards. Spartan success may easily be attributed to the military regimen, but it should be noted also that the regimentation began so early as to displace family interference. Stern discipline, military uniform and salute and the presence of an enemy may do much against odds. And where such discipline does not meet the expectation of preferential treatment which the family circle begets it is finally effective. Nowhere better illustrated than in the military is the fact that a common life, even though initially felt as against the will, eventually

breeds common sentiments. Behavior precedes ideas and in the long run always conditions them. If the environment, either physical or social, sets barriers too difficult to override, then activity, adapting itself ad interim to what is allowed, later contents itself with the residual course and at last breeds feelings that reenforce the stream of action, by now habitual. These feelings accepted as appropriate constitute standards.

On the road to this acceptance of standards as the etiquette of desire sanctions stand like stern sentinels. A sanction must itself ordinarily be accepted as a means before it can be effective toward an end. Compulsion there is in social control, of course; but compulsion gets its influence from the antecedent acceptance of it by the majority of people concerned. That is, it is the show of compulsion rather than the fact which ordinarily influences conduct. Illustrative of this is the working of such a stern sanction as ostracism in ancient Greece: powerful men accepted without a hostile gesture the verdict of expatriation and went quietly away from all that was dear to them—staying until public opinion changed or until they could themselves overwhelmingly override the forces that led them to accept their fate. The notable thing about sanctions, whether theological or physical or legal, is that when the show of force declines they lose progressively their own influence. The role of the state historically has been to maintain the conditions of compulsion for the regulation of conduct at its extremes. Underassertion of energy, overassertion of energy, crisscross assertion of energy—of these the state takes cognizance, though it is an acknowledgement of the essentially active nature of men that the state seldom uses force to stimulate men to act. Coercion may be used to turn action from one channel to another or to stop it altogether; but that men will and do act is the most dependable of assumptions regarding the human nature which when canalized issues as conduct.

Perhaps the greatest metamorphosis inside the field set by this discussion is the subsidence of intent from the realm of conduct. The state finds it progressively impossible to enforce standards upon thinking; where this change is most notable is in religion. Men were once held responsible for what they thought as well as for what they did. The almost complete recession of this attitude does not mean that character no longer counts, but that where it counts is in conduct. As purely private, if it ever be so, it

may be enjoyed as a luxury. John Stuart Mill expressed well the influence here of the whole utilitarian movement in declaring that motive that does not change the intent and thus the ensuing consequences does not count in morality. The pragmatic movement, especially as represented by William James, furthered this tendency begun by deism and continued in utilitarianism by holding that only what makes a difference for conduct is proper ground for any distinction. This emphasis may be taken to mean, as by behaviorists, that intent and even consciousness as a whole is a function of doing, or it may be taken to mean that social control reaches the boundary of fruitfulness when it releases the springs of spontaneity that constitute the uniqueness of each individual.

CONFÉDÉRATION GÉNÉRALE DU TRAVAIL, the General Federation of Labor, known by its initials as the C. G. T., has a position in France similar to that of the American Federation of Labor in the United States and of the Trade Union Congress in Great Britain.

Modern trade unions (*syndicats*) began to develop in France after the passage of the law of 1884 permitting trade union organization on a national as well as local basis. Within ten years there had come into existence about 2200 trade unions, including over 400,000 industrial workers. National trade unions had been formed by the typographical and the textile workers, by miners, railroad men and workers in several other industries. In fourteen cities there had been organized so-called *bourses du travail* (labor exchanges), which corresponded in a general way to the city central labor unions in the United States as these functioned prior to 1900 and which had been combined into a national federation. Since 1886 there had also been in operation a *Fédération Nationale des Syndicats*.

Because of the traditional intimate relations that bound the working class elite of France to the socialist movement, which at the time was split into five organizations torn by rivalries of doctrine and of leadership—not to mention the anarchists, who were also influential in some *syndicats*—trade union unity was impossible. It was in reaction to this disintegrating influence of socialism, particularly in the *Fédération Nationale des Syndicats*, that the C. G. T. was founded in 1895. It was reorganized in 1902 by consolidation with the *Fédération des Bourses du Travail*, then at the height of its influence, the *bourses* for a time representing a territorial union of local *syndicats* within the C. G. T. to supplement the industrial unions.

Factors which accelerated the process were the industrial prosperity of France, the turmoil of the Dreyfus affair, the continued socialist divisions due to the *cas Millerand*, and the efforts of the Waldeck-Rousseau government to win over labor by protective legislation.

From 1903 to 1906 the C. G. T. had a spectacular career. It took a leading part in strikes, carried on vigorous antimilitarist and antipatriotic propaganda and staged several antigovernment demonstrations. The climax was reached in 1906 when the C. G. T. organized a general strike movement for the eight-hour day, which threw France into fear of an immediate revolution. Elated with these activities the C. G. T. rejected an offer from the Socialist party for common action. Instead it adopted the so-called *Charte d'Amiens*, which stated clearly and definitely the ideas and programs of revolutionary syndicalism as an independent labor and social movement distinct from both socialism and trade unionism. Revolutionary syndicalism rejected all state and parliamentary action as tending to obscure the class struggle; criticized the policy of high dues, of benefits, of peaceful wage regulation and of collective bargaining; and urged the workers to use direct action, including sabotage and violence, and to prepare for the social revolution, which by means of a general strike would abolish private property and the state, and to organize a socialist society, of which the *syndicats* were to be the "cells."

After 1907 the French government under Clemenceau and Briand undertook to cope with the C. G. T. Clashes between strikers and the police became increasingly frequent and were often followed by the arrest of prominent C. G. T. members. As a result the C. G. T., although

growing in membership from 203,000 in 1906 to 400,000 in 1912, declined in strength. A demand from the more conservative members for the abandonment of the "revolutionary romanticism" of 1903-06 and for a revision of policy was becoming more insistent at the outbreak of the World War.

At this time the C. G. T. under the leadership of its general secretary Léon Jouhaux, who is still in office, threw in its lot with the French government. Between 1914 and 1918 the C. G. T. became a recognized national institution, rendering great aid in keeping up the war morale of the workers. These war activities, however, caused a new division in its ranks. An antiwar minority appeared early in 1915, which participated in the Zimmerwald and Kienthal conferences of 1915-16 and which in 1917 hailed the Bolshevik revolution and became increasingly hostile to the official policies of the C. G. T.

Regardless of these divisions the C. G. T. profited by the great unrest of 1918-20, and its membership jumped to 1,200,000. It promoted a general increase in wages, an improvement in labor conditions and obtained the passage of an eight-hour law. Sections of the C. G. T., however, continued to be agitated over the issues injected into the European labor movement by the Third International and demanded that the C. G. T. pursue an aggressive policy of immediate social revolution for the formation of an International Soviet Republic. In opposition to them the official leadership of the C. G. T. fell back upon the *Charte d'Amiens*. In 1920 the miners and the railroad men were precipitated by the revolutionary minority into disastrous general strikes. In 1922 the revolutionary minorities, consisting of anarchists, communists and others, broke away and formed the *Confédération Générale du Travail Unitaire* (C. G. T. U.). In 1926 the anarchistic trade unions formed a separate organization, whose membership is small, known as the *Confédération Générale du Travail Syndicaliste Révolutionnaire* (C. G. T. S. R.). This division has persisted and the French labor movement continues to be divided between two major central organizations. In 1929 the C. G. T. claimed 640,790 members and the C. G. T. U. 409,595 members.

At the present time the C. G. T., although weakened by the rival C. G. T. U., is still the representative national labor organization of France. It has the affiliation of the strongest and oldest trade unions. It claims to be true to the

principles of the Charte d'Amiens. The policies and methods of the C. G. T., however, differ markedly from those of pre-war years. The C. G. T. at present not only takes a friendly attitude toward the Socialist party of France but also works in cooperation with the French government. Although pacifist it no longer carries on its pre-war antimilitaristic and anti-patriotic propaganda. It is largely concerned with its program of immediate reforms, first formulated in 1918 and revised in 1924 and again in 1927, which deals with financial stabilization, better housing, the eight-hour law, social insurance, family wages, paid vacations and immigration. It was instrumental in promoting the passage of the social insurance law which went into effect on July 1, 1930, and which provides for sickness, maternity, invalidity, old age and life insurance. In this social role the *syndicats* now stress the gradual development of workers' control in industry and take an active part in the work of the Superior Economic Council, which was established by administrative decree by the Herriot government in 1925 and which is in process of becoming part of the legal system of France. Internationally the C. G. T. is a member of the International Federation of Trade Unions and of the International Labour Office and cooperates with the French government in the League of Nations. These policies, however, are now under attack from the more radical minority, which has recently been gaining influence as a result of the strained economic situation and which is demanding a return to the aggressive methods of syndicalism.

In form of organization the C. G. T. is partly geographic and partly industrial. Geographically its local trade unions now form departmental federations, one for each of the departments of France. Industrially the local trade unions are combined into thirty-five national trade unions which differ greatly in organization and policies and which are allowed wide autonomy in their internal affairs. The C. G. T., however, has important powers, such as that of calling general strikes. The governing body of the C. G. T. is a national committee composed of one delegate from each national trade union and one from each departmental federation. The executive organs are an administrative commission of thirty-five members and a confederal bureau consisting of a general secretary and four associates.

CONFESSION. The social history of confession reaches back into preliterate society, where it appears as part of the magic rites performed to ward off the consequences of violation of customs and tabus. Among the Badagas of southern India when a man dies an elder of the tribe recites the sins which may have been committed and lays the list upon a buffalo calf to be carried away. Among the Babylonians a man recited before the gods all the possible sins that he might have committed knowingly or unconsciously and dispelled them by magical incantations. The same practise is prescribed in the Egyptian *Book of the Dead* as a preparation for the journey of the soul into the future life. The sins mentioned are repudiated by magic formulae in which the potent names of the gods are spoken to destroy all evil deeds. The Greek mysteries were rites in which the first step of initiation was purification by confession. The beginning of all mystical illumination is through purgation by fastings, vigils and declaration of sins. In primitive Buddhism self-examination and confession were practised. Twice a month the monks gathered and were exhorted not to dissemble their shortcomings. The categories of offenses were read

and the monks were called upon individually to confess their faults. In the early stages of culture the confession of sins is largely a magical performance rather than a moral experience. When the gods have come to be regarded as something more than vengeful spirits and are thought to exercise moral judgment, confession gains ethical import, although magical attitudes persist. Confession of the definitely moral type appears in the Bible in the confessions of Jacob (*Genesis* xxxii: 10), of Achan (*Joshua* vii: 20) and of David (*1 Samuel* xii: 13), which are expressions of the consciousness of the violation of recognized law and of personal rights. On the Day of Atonement the high priest annually made confession for the whole people by placing the sins of the community on a scapegoat. After the Babylonian exile the liturgical confession arose among the Jews not so much from a sense of individual sin or the imperfection of human nature as from desire for amelioration of the general conditions of life. Judaism gives conspicuous importance to repentance as a means of atonement.

Examples are numerous of the alleviation of punishment as a result of the confession of guilt. In the Chinese penal code a man who has committed an injury which can be repaired by restitution or compensation may be pardoned if he surrenders himself voluntarily and acknowledges his guilt to a magistrate before it is otherwise discovered. In the Laws of Manu guilt is exculpated if confessed. Aristotle recognized the influence of confession of guilt in the tempering of the wrath of the one injured or offended.

The doctrine of forgiveness, prominent in the New Testament, implies confession of sin and repentance. The converts of John the Baptist confessed their sins. The parable of the prodigal son turns on his confession and his change of attitude. "Confess your faults one to another," is the injunction of James. The power of pardon was apparently lodged in the congregation (*Matthew* xviii: 18; *John* xx: 23), and this involved confession before the whole church, a practise which has reappeared in some modern sects, such as the Free Methodists. John Wesley, who believed in the therapeutic value of confession for banishing irregular or illicit fancies, organized "band societies" which met once a week and before which each member stated the faults he had committed in thought, word or deed and the temptations he had felt since the last meeting.

The development of the confessional extended over several centuries. It was not until the close of the second century that the Christian churches began to mark out for special reprobation the mortal sins of murder, idolatry and adultery. The guilty person was required to make public confession and to perform penitential exercises and was excluded from the communion for life or until readmitted after long discipline. The list of mortal sins was increased during and after the fifth century to all crimes which the Roman law punished with death, exile or severe bodily penalty. Leo I in the middle of the fifth century substituted private confession to the priest for public confession before the congregation. The modern system of confession developed from the practise in monasteries and nunneries of confessing transgressions of the rules of the order to the superiors and from the habit of seeking advice from priests in secret confessions. The Council of Châlons in 813 recognized the equal validity of individual private confession and confession to a priest. It was an open question as late as the twelfth century whether all mortal sins should be confessed to the priest. The fourth Lateran council in 1215 ordained that all must confess their sins at least once a year to their parish priest. The final form of the doctrine and practise was fixed in the Council of Trent in the sixteenth century, which extended the list of sins to include all sins, even sins of thought, which separate the soul from God. After baptism the only remedy for mortal sin became confession to a proper priest.

Confession is prescribed in the ritual of the Roman Catholic, the Greek, the Russian Greek, the Coptic, the Syrian and the other oriental churches and is obligatory in most of them. In the Lutheran church auricular confession continued after the Reformation but was later displaced by general confession and absolution. The Church of England employs general public confession, which is used by each member in private for his own sins, followed by public absolution. Particular sins are to be acknowledged to him who is aggrieved, and if the sinner still cannot gain satisfaction he is invited to make confession to a minister. A sick man may make private confession if he feels the need of it to relieve his conscience. Auricular confession although not the general practise never disappeared from the Church of England. It has increased since the middle of the nineteenth century but continues to be the subject of sharp

discussion. The other large Protestant bodies, the Presbyterian, Methodist, Congregational and Baptist, definitely reject auricular confession but retain in effect the general confession and encourage individuals to make secret confession to God and to seek forgiveness through prayer.

The value of the confessional to the church is found in the support it gives to established doctrine and to the maintenance of established moral standards. Modern psychology has tended to strengthen appreciation of its value and to broaden the conception of its function in relieving the mind of the penitent from the conflicts and repressions characteristic of the sense of sin. Nervous strain and many forms of hysteria due to the consciousness of wrongdoing are overcome by making confession of their causes, especially to one who is believed to have power to give absolution. But confessions do not disclose and rarely interpret deep rooted repressed unconscious factors.

Confession in a secular setting has developed greatly under the influence of modern psychology and through various forms of psychotherapy in connection with the regular practise of medicine. This is due largely to the influence of Sigmund Freud and his school, although the value of confiding fears and other elicits of repressed complexes to a physician or minister is recognized quite independently of Freud's theories. The technique of psychoanalysis is in reality a method for aiding the patient to reveal his inner conflicts in order to objectify and thus escape them and also to discover means for establishing a better integration of personality.

CONFISCATION. The concept of confiscation started from a specific legal connotation and then underwent a process of transformation

until it has finally become a kind of philosophical concept referring to a set of phenomena which are found wherever politically organized communities exist. Instead of a clear concept narrowly confined to one legal system we have a vaguer concept of more or less universal application. Speaking historically, we find that politically organized communities have repeatedly transferred a great deal of private property to the public treasury without offering the deprived individuals adequate compensation. We also find that such confiscatory acts tend to multiply at times of revolution when the existing legal order is undergoing a sudden change. The theorists of all forms of state absolutism tend to "justify" such acts by considering them as rights, privileges or prerogatives of the sovereign or of the state. In order to check the abuses to which such a justification may be put the theorists of all forms of individualism have tended to deny such justification by making the individual's right to his property inviolable, calling it a "natural right." Confiscation then appears to be one of the concepts which rationalize the factual limits of the sphere of so-called fundamental legal rights.

It is a far cry from such a general concept to the very distinct purpose for which the word *confiscatio* was originally coined. As the position of the *princeps* developed in imperial Rome, each transfer of property to his treasury (*fiscus*) was called a *confiscatio* in order to distinguish it from transfers to the public treasury (*aerarium populi romani*). The claims of the *fiscus* were apparently collected through administrative procedure and the goods liable to confiscation were *bona vacantia* (free goods), *caduca* (heirless goods), *bona damnatorum* (goods of the condemned). Besides these rights the *fiscus* collected taxes from an ever widening sphere. Even the collection of the rents from imperial farms, as in Egypt, was a *confiscatio*. In all these instances the substitution of the *fiscus* for the *aerarium populi romani* was quite gradual, beginning in the imperial provinces presumably by mere usurpation. All that we have spoken of so far are instances of legal *confiscatio*. But the struggles attendant upon the succession to the imperial office often resulted in extensive confiscations in the historical sense. The confiscations of Alexander Severus are a notable example. In fact if not in name, such confiscations were analogous to the large scale expropriations of the proscribed during the time of the decay of the republic.

The Roman concept of *confiscatio* underwent a complex transformation when used in the Germanic kingdoms of the early Middle Ages. It would certainly seem unjustifiable to assume that the mere occurrence of the word meant that the Roman institution had reappeared. It is hardly questionable in the light of Brunner's work that the actual situation in connection with which the concept of *confiscatio* is used in the tribal laws of that period (e.g. *Lex salica* 60, 3) is rooted in a more ancient legal usage. Ancient outlawry (*Friedlosigkeit*), making the outlaw a common enemy of the community, deprived a person of his property, or rather such person became incapable of holding any property at all. This is clearly evident in the custom of wastage (*Wüstung*), the utter destruction of the house and all belongings of the outlaw. It was a matter of blotting out the memory of the breaker of the peace as far as possible. The Roman concept of *confiscatio*, resting upon the late Roman concept of absolute private property, could not possibly have prevailed in communities which thought of property only as rights, as attributes of personal relations. Consequently the legal concept of *confiscatio* has not gained any but passing significance in European systems of law. Feudalism, however, produced everywhere legal institutions which imply confiscation in the modern sense. Many minor offenses were punished by the confiscation of some part of a man's estate, beginning with his personal property and ultimately including his real estate. Confiscation thus became one of the major sources of income for feudal lords of all ranks. Only in a few cases like the *crimen laesae majestatis* was the right of confiscation attributed to the king, with the result that as the king's power grew, a growing number of offenses were included under this head, just as had happened earlier in the case of breaches of the king's peace. But it must be remembered that these feudal confiscations are the natural consequence of a system which tended to treat all governmental functions as personal privileges and in which an individual might therefore acquire a vested interest (*jus quaesitum*). Such vested interests (*wohlerworbene Rechte*) became the battle ground between the *princeps legibus solutus* and the feudal lords as well as the ecclesiastical and municipal corporations. The gradual ascendancy of the king is associated with an increasingly Roman interpretation of *confiscatio* and the late sixteenth and early seventeenth centuries saw, partly as a

result of the religious wars, more wholesale confiscations than any preceding period. The hope of the future lay first in drawing a clear distinction between governmental functions and private property, and secondly in insisting upon popular control of the *fiscus* and the *domanium*. Although these two steps had been taken by the more highly developed city-states in the fifteenth and sixteenth centuries, these essential aspects of the *Rechtsstaat* were not fully realized in territorial states of continental Europe until the nineteenth century.

The development in England is perhaps even more instructive. Forfeiture and escheat were the primary legal instrumentalities upon which confiscatory acts were based. But the legally significant aspect was that a criminal had lost his right to hold property; the problem as to what happened to the property after the criminal had lost it, which was the perplexing thing under Roman law with its strictly individualistic concept of property, did not particularly concern the English law, which treated property as a right derived from and dependent upon the personal relation between lord and vassal. In the early thirteenth century when the king was attempting to gain a right to the land of all felons, Magna Carta distinctly stated that the king had no such right in the case of ordinary felony; but it recognized his claim in the case of high treason. It was inherent in the rivalry between king and lower lords that the right to seize such forfeited or escheated goods and lands should become a matter of extensive controversy in which the analogy of the Roman *confiscatio* was used to bolster up the king's claims, particularly since the king was in a vague way identified with the politically organized community. High treason involved a breach of the king's peace and therefore later that of the oath of ligeance (*juramentum ligeantiae*). The possibilities of increasing the king's revenue by claiming a breach of the king's peace with its attendant confiscations produced recurrent attempts to include more and more felonies under this category, which led to a statutory definition of high treason in the reign of Edward III. Still it remains rather misleading to translate forfeiture as *confiscatio*. Attention is focused in forfeiture upon the fact that the perpetrator of a crime has lost his rights. It deals with the problem of a person who has an impaired legal status, not with the problem of a person who has a status beyond the law, like the Roman *princeps*. The difference becomes

very apparent in what Blackstone calls the only ground for forfeiture: the principle that all property is derived from society. But forfeiture does not necessarily imply transfer of property to a public authority at all (e.g. securities may be forfeited to the creditor under certain conditions). In view of this fact Blackstone attempts to draw an interesting distinction between the two concepts, calling confiscation a type of forfeiture in which the property forfeited accrues to the crown. But this distinction has not been accepted by many later writers particularly since other forms of forfeiture were rapidly becoming obsolete. In the nineteenth century the distinction was construed by some authorities to be that confiscation follows upon forfeiture. The person by his felonious act forfeits his property, and the government thereupon appropriates it. Obviously, such a view implies an attempt to combine the common law solution of a common law problem with the Roman solution of a Roman problem. Others have maintained that confiscation has no place in common law countries because forfeiture is "the technical and appropriate term." This sort of notion goes together with the general proposition that the idea of an absolute power or public authority has no recognized place in the common law. Although it would be false to deny the significance of this idea, it is well to recall that the purely natural necessities of political existence have obliged men believing in this idea to seek more respectable subterfuges in such legal instrumentalities as forfeiture, escheat, alienation, eminent domain and the like in their efforts to legalize what were in fact confiscations. The heyday of such confiscations was in England as elsewhere the sixteenth and seventeenth centuries, when the struggle between the crown and the church and later between the crown and the "heretics" gave wide opportunity for appropriating property upon the ground that it had been forfeited by abuse or by treason. A notable instance is the dissolution of the monasteries under Henry VIII. We have in these acts a typical illustration of the way in which legislative supremacy may be used for what is in fact an employment of force in expropriating individuals or corporations obnoxious to the community. It ought to be borne in mind, however, that Henry and his parliaments did by no means originate such confiscatory measures; under Henry IV the Commons petitioned more than once for the confiscation of church property, and in 1414

the alien priories had been "granted" to Henry V. After Wolsey's fall Henry had by an act of Parliament received the spiritual authority of the pope and the confiscations continued to be carried out under the cloak of ecclesiastical reform. Another striking instance of wholesale confiscations in English history may be found in the acts of Cromwell on behalf of the Commonwealth, particularly in Ireland. The Cromwellian Settlement transferred the property of land in two thirds of Ireland to new owners. In England too the parliaments of the Commonwealth again and again resorted to confiscating the estates of alleged malignants in order to meet the expenses of army and navy, but since the "glorious revolution" the tendency in England has until rather recently been to avoid confiscation under no matter what legal disguise.

In order to find instances of large scale confiscations one would have to follow the path of empire. And even the use of the legal instrumentalities which once served the purpose of confiscation has been circumscribed by increasingly narrow limits. Juries in Blackstone's time were already averse on grounds of public policy to imposing forfeitures. The nineteenth century saw them disappear almost entirely. Not quite the same statement can be made for France or Germany; in fact, the French Revolution and its aftermath witnessed confiscation on a considerable scale. The idea of the inalienable right of the community to all goods was insisted upon, but its application was made first of all to the possessions of the clergy (not private property, strictly speaking) which were declared to be *biens nationaux*. The large estates of the nobility, either guillotined or émigré, were another fertile field for confiscatory activities, or, as one now begins to say, nationalization. In the meanwhile the successful struggle for independence of the United States of America had made traitors of loyal subjects of the crown; and since there remained no crown to which their forfeited estates could revert, the concept of confiscation was suddenly revived. And when in addition the American constitution went far toward establishing an absolute and individualistic concept of private property, confiscation began to acquire a new significance as a legal concept. American courts, however, not familiar with the notion of a *fiscus*, have usually spoken of the public treasury. American judicial decisions have gone through very gradual development characterized by much groping tentativeness. Certainly such definitions as that of the

much cited *Ware v. Hylton* (3 U. S. 199), "To confiscate is to transfer property from private to public use," would make confiscation a very broad category indeed. It has consequently been urged that confiscation should not be used to describe the legitimate exercise of the tax power or of eminent domain or the condemnation of private property as prize under the international law of war. But it seems doubtful how a distinction of this variety can be drawn successfully. At any rate, the confiscation acts of the Civil War period were enacted by Congress in the exercise of the war powers. These acts authorized the seizure, condemnation and forfeiture of property used for insurrectionary purposes (for their construction see 74 U. S. 454; 78 U. S. 268; and others).

In recent years much has been heard concerning confiscatory measures in connection with attempts to achieve government regulation of commercial activities. By exploiting the unhappy historical associations of the concept some designate the loss of property as confiscation even when it is not transferred to the public treasury at all, while others who actually advocate the transfer of large amounts of property to the public treasury employ the more appealing word nationalization. This idea is very important in contemporary socialistic thought and indicates the close relation which such thought has to some form of state absolutism.

The problems which have arisen since the World War in this connection offer a fitting conclusion for any discussion of confiscation in the sphere of international law. Although the peace treaties rendered lip service to the principle of inviolable property rights, the methods which they provided for compensation were widely considered to be tantamount to partial confiscation. Next, the establishment of the dictatorship of the proletariat in Russia not only entailed the confiscation of the estates of adherents of the old regime but the abolition of private property as such. In the newly created states various constitutional measures were taken which amounted to confiscation of much landed property, since the compensation amounted usually to only a small percentage of the pre-war value. Germany, which after the war set out upon the path of general nationalization, scarcely got beyond the stage of discussing possible steps. Yet it is not without significance that articles 153, 155 and 156 of her constitution envisage confiscatory legislation. An important direct application of this

power is seen by some in the obligation placed upon German industry under the Dawes plan. Indirectly the legislation regulating the rents charged for dwelling houses was in effect a confiscatory measure. Similar legislation was also enacted in England and Austria. Moreover, it deserves to be noted here that the depreciation of a currency, such as occurred especially in Russia, Austria, Germany, Italy, Spain and France, may have the effect of depriving certain people of their property; and in so far as the public treasury receives income by this process, inflation is a form of confiscation. Yet it is difficult to check judicially, because the right of coinage is a prerogative of the sovereign. Still, the International Law Association resolved that "it is contrary to the principles of International Law to deprive a foreigner, or a member of a protected minority, of the fundamental rights to which he is entitled as owner through indirect ways which, though not in law, but in fact, lead to an expropriation without real compensation." In the light of the facts this resolution seems a pious wish rather than living law. Even in the United States the due process of law clause of the constitution is ineffective against the constitutional amending power as well as against any legislation implied in the enforcement of a constitutional amendment, particularly when there is involved in the minds of many citizens a moral issue. Certainly the owners of saloons, whether citizens of the United States or not, were deprived of their property without just compensation, no due process of law being allowed. In view of all these tendencies it strikes one as curious that the International Law Association should have resolved that "it is generally recognized by the constitutions, civil codes or common law of civilized States that private property may not be expropriated without compensation," and that "in so far as the question of the immunity of private property from confiscation arises in international relations, the same principle is generally accepted." It is highly objectionable to make the extent to which abstract and absolute property rights are recognized the criterion of civilization. Did the United States become less civilized by passing the prohibition amendment? Moreover, it seems more in keeping with the legal traditions of the European past to insist that the extent of a person's rights is dependent upon his status in the community. In the long run international law cannot fulfil its functions if it attempts to codify where

municipal law is in a state of great flux. If the inviolability of private property were used as a standard, the adjective "civilized" could probably not be awarded to any nation. Obviously, this is absurd. It is wiser to content oneself with saying that it is a recognized principle of all nations that property rights shall not be transferred by action of the public authorities from one private individual to another nor shall they be transferred to the public treasury except for a publicly known and constitutionally sanctioned purpose. If aliens own such confiscated property, the public treasury of the government under which they live should probably be recognized as successor to their rights. Such a statement would indicate the nature and limitations of confiscation within the modern state.

CONFLICT OF LAWS.

HISTORICAL AND THEORETICAL ASPECTS. Generally speaking, the conflict of laws is that branch of jurisprudence which comprises the principles for determining the rights of persons in private international relations. Upon the continent the term private international law is used

as synonymous with the term conflict of laws.

In the time of the Greek city-states at least, it became evident that foreigners and foreign transactions could not be governed by considering the local law alone. In order to maintain useful foreign intercourse account had to be taken of foreign law, and this was done by inter-municipal treaties granting "justice" to the citizens of different cities. Rome in dealing with foreigners in the city developed a *jus gentium*, which was supposed to be derived upon principles of equity from common foreign law sources but was in no sense a conflict of laws, as foreign law was not applied as such. The foreigner was not regarded as the subject of another sovereign and as such entitled to that sovereign's law but rather as an estray who could not have the benefit of the *jus civile*, which governed the relations of Roman citizens. The *jus gentium* is thus to be regarded as a special common law intended for the free individuals of all nations. When the imperial law of Rome became widely extended because of the growth of the empire, many survivals of the older law maintaining themselves as provincial customs caused difficulties. Several solutions of such questions are contained in Justinian's *Digest*.

The coming of the conquering barbarian tribes among the Romans created a new problem. Because they were conquerors they could not be treated as intruders and judged by the *jus gentium*. But since the theory had already been developed that a Roman citizen was entitled to be judged by the Roman law wherever he might be, this privilege was now naturally assumed by the barbarians, and the so-called regime of the personality of law became established under which members of different races had the right to be judged by the law of their birth. This personal, racial system of law was inevitable under the conditions of dissolution which marked the decline of the Roman Empire and accorded well with the necessities arising from the frequent migrations of the Germanic tribes. Bishop Agobard of Lyons wrote in the middle of the ninth century that it happened frequently that of five persons meeting in one room each lived by a different law. Where the population was very mixed, a custom became established of making a *pro-fessio juris* in the case of each closing of a legal transaction. But since legal relations were not complicated, a few simple rules sufficed: inheritance was governed by the decedent's tribal

law; composition for crime was determined according to the criminal's law; and in contracts each party was ordinarily bound by his own law. Fundamentally, however, the regime of the personality of laws represented a conflict of legal systems rather than of particular laws.

With the greater and greater intermingling of races and the growth of local customary law under the influence of feudalism, which, based upon land holding, tended naturally to emphasize law of place, the conception of the territoriality of law became established in the later Middle Ages. But it should be remembered that the process of transformation was very gradual. Territoriality at first certainly had little in common with the modern conception of territorial sovereignty. Personal law was held precious throughout the Middle Ages, and it was rather the practical impossibility of determining personal origin that caused the law of place to prevail ultimately. If laws conflicted, they were the conflicting laws not of sovereign and independent states but of particular localities. Thus it always appeared less necessary to confine the force of laws to the boundaries of the places where they first originated.

The modern jurisprudence of the conflict of laws may be said to have had its first origins in Italy, where growing trade and manufacture were being protected by city-states. The Roman law was the common law of the peninsula, but each city had its own *statuta* derogating from this imperial law in many aspects and hence giving rise to conflicts. Since the study of Roman law had undergone a great revival in Italy, Bartolus, who may rightly be regarded as the founder of the modern science of the conflict of laws, resorted to the texts of Justinian's *Digest*. His work is particularly indicative of the fact that, while feudalism was disintegrating, the principle of territorial sovereignty had not yet become established. The growth of commerce made it convenient for a person not to lose his rights of personality as a result of mere temporary residence for the purposes of trade. Bartolus held that, while the universal Roman law was also for the benefit of strangers, the *statuta* were restricted to local operation; from this followed the leading principles that a statute which affected persons only would not operate against foreigners, that a statute which affected things would operate against both foreigners and citizens and finally that a statute which related to the person would follow him wherever he went.

Meanwhile in France the provincial *coutumes*, derived from the tribal laws, had developed as local laws under the stimulus of feudalism. As in Italy, the region in which each governed was small but there existed also the actual overlordship of the king with his own law for his own fiefs. Intercourse between the different provinces called for a solution of conflict between laws, accentuated by the fact that unlike the *statuta* the *coutumes* because of their sharp differentiation from the Roman law were no longer regarded as mere exceptions to it but as the true law of the provinces where they prevailed. For while politically parts of the same country these were distinct units for the purposes of law administration. In a sense they constituted a federal nation, and thus the problem of conflict they presented was distinctly modern. The territoriality of the customs here almost entirely superseded the personality of law; but since the provinces were not entirely independent states, domicile was substituted for tribality in the law of personal relations. This development is clearly shown in the so-called French statistists of the sixteenth century, especially Dumoulin and d'Argentré, who developed from the Italians the theory of the statute personal (the law that accompanied the person and governed him wherever he went) and the statute real (the law of the land). Naturally, there could be great difference of opinion regarding the type to which a statute belonged. The kinship between the theory of real and personal statutes and the Bartoline views is manifest, and indeed the former theory has been erroneously attributed to Bartolus; but if he used the phrases, they meant to him simply statutes relating to things and statutes relating to persons—the terms in themselves had no jurisdictional connotation. While Dumoulin remained greatly under the influence of the Italians, d'Argentré, who was a feudal provincial lawyer, regarded almost all the customs as "real," accepting only perforce the Italian views of the extraterritorial effect of status and capacity.

Due to the waning of feudalism in France the territorial doctrine of d'Argentré fell upon barren ground there. It was, however, carried to its logical conclusion in Holland in the seventeenth century. The confederated Dutch provinces, practically autonomous states, jealous of each other's independence and power, welcomed a doctrine which served to repel any encroachments on their laws. The early Dutch writers rejected all ideas of statutes, personal or

real, and leaned more and more to the theory that each state applied its own law to the solution of a legal transaction in which conflicts of laws were involved. The principal writers, John Voet and Ulric Huber, thus fully accepted the territoriality of law. Yet, since it was necessary often to apply foreign law, they invented the doctrine of comity (*q.v.*), whereby rights acquired in another state were recognized only as a matter of grace. The principle of the sovereignty of states, proclaimed by the Treaty of Westphalia in 1648 as cardinal in public international law, was thus introduced into the conflict of laws, as well as the idea of juridical monopoly by the political state.

In England, where the common law had developed as the general custom of the whole realm, the necessity for developing a doctrine for solving conflicts did not arise early. But when it did, toward the end of the eighteenth century, English judges naturally turned toward the Dutch writers. The reception was assisted doubtless by the fact that William III was not only king of England but *sovereign* of Holland. But fundamentally it was due to the fact that the insular and feudal common law had a territorial character. A solution of conflict of laws became even more imperative in the American colonies after independence, when each retained its own laws and interstate trade and social intercourse steadily increased. When Story, writing in 1834 the first treatise in English on the conflict of laws, found comparatively little in decided cases, he turned to Huber, partly because of his accessibility to him in translation but largely because the Dutch school's intense territoriality of feeling accorded better with the genius of the common law than the French school's theory of statutes. The work of Story has come to form the basis not only of the American but of the English conflict of laws. The term comity, imported by him into Anglo-American law, was stated by him to mean the comity of the state, not the comity of the courts. While the state was not bound to recognize rights accruing under foreign law, no principle has been imbedded more firmly in Anglo-American law as a matter of practise. Unless contrary to the public policy of the state of the forum rights of foreign origin have been enforced in the same way as in the case of similar rights of domestic origin. The respect for vested rights in America, particularly as a result of constitutional limitations, has had a great effect in upholding them even when they have been

of foreign origin; indeed, a theory of vested rights has become substituted for comity in the conflict of laws under the common law. Dacey was important in the later development of the conflict of laws in England. A recent form of the territorial theory in the United States has been the "local law theory" enunciated by Cook and Lorenzen, according to which there is no right in the state of the forum until it is created by the court in deciding a case, although in order to do justice the forum usually creates for the parties a right as nearly as possible identical with the right created by the state in which the transaction took place.

Fundamentally speaking, there are three modern theories of the conflict of laws. The territorial theory prevails in common law countries. The statutory theory of the mediaeval authors prevails in France, Belgium, Italy and Spain, the countries which were thoroughly Romanized. Their past experience with personal law has made a personal solution of conflicts seem natural from the time of their achievement of unified, national law. No incongruity has been felt in supposing an actual contest for supremacy between the law of the land and the law of the person. On the whole, the doctrine has been accepted that the personal law of a party to a transaction accompanied him when he went abroad and prevailed in everything that had a predominantly personal aspect; while anything that predominantly concerned the country where a transaction took place was governed by the statute real. This has, however, been greatly modified by the development of a principle of public order, which holds that every transaction, although predominantly personal, in which a question of public order of the place of transaction is concerned is governed by the law of that place. Another exception lies in the principle of the autonomy of the will, according to which voluntary juridical acts are governed by the law with respect to which the parties intended to contract.

Under the statutory theory difficulties of *renvoi* have been often prominent. They arise when the law to which a question of conflicts has been referred in turn refers the solution back to the first law or sometimes even to a third law. If, for instance, the law of state X refers the right to an inheritance to the law of state Y, the decedent's last domicile, while the law of Y refers it back to his national land, X may accept the *renvoi* and determine the inheritance by its own law or refuse the *renvoi* and send it back to Y,

whereupon the process might continue forever. The solution that has been most favored is the acceptance of the first *renvoi*.

The third of the chief modern doctrines represents an international view of the conflict of laws. It is held particularly in the Netherlands and Germany. The doctrines of private international law have been regarded as having a supranational sanction similar to that of public international law. It is conceived that a single body of principles exists, binding on all nations, by which the necessity for any choice between two sets of independent laws is obviated. Beginning with the work of von Bar, the theory was highly developed by Zitelmann. The more recent work of Frankenstein, an ingenious doctrine of primary and secondary statutes, seems to turn toward the French school.

The desire for a world law is natural in a country as small as the Netherlands which nevertheless has a considerable foreign commerce. The conception of an overlaw constraining the local law and operating by its own power is readily understandable in Germany, where order and authority have seemed all important since the experiences of post-Napoleonic days. Generally the international view represents a reaction against the maintenance of the principle of sovereignty in the determination of individual legal rights. Its adherents have the conviction that no scientific system of the conflict of laws can be evolved upon such a basis. The protest is also directed against those differences of law which have been accentuated since the French Revolution by the intense feelings of nationality which then began to prevail.

The doctrine of nationality in the conflict of laws has had a great vogue. Under the statutory theory nationality has been substituted for domicile as governing personal rights in western Europe, and international conferences to devise a solution for the resulting difficulties have proved vain. The nationalist doctrine of Mancini became the basis of an Italian school of the conflict of laws which taught that the law of a nation was applicable to all its citizens wherever they might go. The attitude is significant in view of the Italian striving for a homogeneous national state. But the Italian school has awakened responses also in France, Belgium, Germany and Spain. Indeed, since the World War the nationalist view has gained ground generally in Europe. It is always stimulated by war. In the United States and the British Empire, however, traditional policy has

not been affected. The absence of a uniform national law for all the states within the union or the empire has rendered inconvenient the application of the principle of nationality.

The modern mobility of population, increased by the World War and its resulting mingling of populations, is likely to have a profound effect upon the development of the conflict of laws. More than ever not only commercial rights but civil rights have to be adjusted. Conflicts in the law governing international marriage and divorce particularly demand solution. It is unfortunate that the views held of the conflict of laws in the two great systems of modern law, the common law and the civil law, have heretofore made it impossible to reach agreement.

JOSEPH H. BEALE

MODERN RULES. In modern times, when persons of different states have a multitude of relations with each other of a business or social character, an especially vast number of legal problems arise in the conflict of laws. The content of the conflict of laws is by no means fixed. In its broader sense it may include all legal problems where the operative facts touch more than one state and do not fall within the domain of international law, without reference to whether they belong to public or to private law. Some writers include in the subject therefore criminal law in its international aspects. Others include the subject of taxation. More commonly, however, the term is used in a narrower sense so as to include only problems of private law and matters relating to the jurisdiction of courts. The many differences in the modern rules of the conflict of laws may be regarded as illustrative of the divergencies of fundamental conceptions.

If the operative facts in a given case have occurred in one state and suit is brought in another, the first question is whether the courts of the second state have jurisdiction. Between some countries the rules in this regard are defined more or less by international treaties, but in the United States they are to be found exclusively in the existing statutes and decisions of the courts. Anglo-American countries give free access to their courts irrespective of the nationality of the parties litigant, whereas in France a wide divergence exists between the rules applicable to French citizens and those applicable to foreigners. In suits arising in the field of obligations (contracts, torts and the

like) there is a fundamental cleavage between Anglo-American law and that of other countries. Anglo-American law allows an action in contract or tort to be brought provided only the defendant was duly served within the state in which the action is brought, without reference to where the contract was made or the tort committed. It is not necessary that the subject matter of the litigation or the parties themselves have any connection with the state of the forum. In extreme cases, however, where such a suit is obviously brought for the purpose of oppression or for some other improper reason, the court upon application of the defendant may decline to exercise jurisdiction. In the absence of personal service no valid personal judgment can be rendered in the contemplation of Anglo-American law. To this rule there are some exceptions; the principal one is that submission to the jurisdiction of the court by the defendant is sufficient. Obviously these rules tend to favor the party who brings the action. Continental law, on the other hand, ordinarily compels the plaintiff to sue the defendant at the latter's residence. Personal service within a state does not constitute a basis of jurisdiction.

Suits relating directly to the title of land must be brought in Anglo-American law in the state where the land is situated. Questions directly concerning the family relation must ordinarily come before the court of the domicile. Jurisdiction with respect to questions of succession must be obtained at the domicile of the decedent with respect to personal property and at the situs with respect to real property. In other countries, under the doctrine of universal succession the courts of the decedent's domicile frequently have jurisdiction with respect to all classes of property.

The question of the jurisdiction of courts may arise also in connection with the enforcement of foreign judgments. Much difference of view exists as to whether such a judgment must have satisfied the jurisdictional requirements of the state in which the judgment was rendered or those of the forum or those of both states. Anglo-American courts will not enforce foreign judgments unless there has been compliance with their own notions of jurisdiction.

Assuming that the court has jurisdiction in a cause of action having foreign elements, the question is whether the rights of the parties shall be determined with reference to the provisions of the local law of the state in which the suit is brought or whether the law of some

foreign state with which the cause of action has some connection shall be considered. This problem is frequently referred to as that of the choice of law. This general problem raises a host of questions in each of the branches of private law. The modern writers on the conflict of laws may be divided into two main groups, depending upon whether they seek to derive the rules of the conflict of law from international law or maintain that these rules have a national basis like the rest of the rules of municipal law. Anglo-American law, belonging to the second group, takes the view that the law of each country or state consists of two parts—one dealing with the municipal law of contracts, torts, property and the like and the other with the rules of the conflict of laws which control with respect to such subjects, if the situation before the court is not a domestic situation but one involving a foreign element.

It proves extremely difficult to find satisfactory legal solutions of conflicts if the facts concern more than one system of law. With respect to contracts it is frequently said that the law of the place where the contract is made controls its validity (*lex loci contractus*). According to this view the nature of the particular contract is of no consequence nor the connection of the contract or the parties with a particular state. The only question would be as to where the contract was technically made. Thus, if a letter of acceptance was mailed by accident in a particular state, the laws of such state would irrevocably control the legal rights of the parties. For this reason many courts prefer to have a more flexible rule. They look to the surrounding circumstances, from which they try to ascertain the law with reference to which the contract must be deemed to have been made.

In the matter of torts Anglo-American courts generally look to the law of the place where the tort was committed. In case of negligent conduct the tort is deemed committed in the state in which its consequences took place. If death results, it is the law of the place where the injury was received rather than the state in which the death occurred that governs.

Property questions are generally determined with reference to the law of the place where such property is situated (*lex rei sitae*). As regards real property the law of the situs governs in Anglo-American law even with respect to matters relating to conveyancing. The validity of a deed therefore, as regards both capacity

and formality, is subject to that law. In the matter of formalities, however, statutes frequently allow the deed to be executed in the mode customary at the place of execution. Executory contracts relating to land are governed in this country generally by the ordinary rules applicable to contracts; the situs of the land is not taken as decisive.

In the matter of personal property the rule that the law of the situs controls has been established only within comparatively recent times. In earlier years, when the importance of personal property was not great and it was generally in the immediate possession of its owner, it was axiomatic that the law of the domicile controlled (*mobilia personam sequuntur*). Today, however, the courts look more and more to the actual situs of personal property in determining the legal relations of the parties with respect thereto. If the law of the situs allows a transfer of title to result directly from the agreement of the parties without delivery of the chattel, the validity of the contract will be determined by the ordinary rules governing contracts.

Upon death the descent of real property is controlled by the law of the situs, whereas the distribution of personal property is governed by that of the domicile of the decedent. The law of the domicile has not been supplanted in this respect. Its retention may be justified perhaps on the ground that it renders the administration of estates upon death more simple. In other than Anglo-American countries, in which all property goes to the heirs upon principles of universal succession, the devolution of the whole estate may be subject to the law of the domicile or the national law of the decedent.

Wills disposing of real and personal property are governed in England and in the United States, in the absence of statutory provision to the contrary, by the law governing such property in case of intestate succession. By statute wills are frequently rendered valid as regards formal execution, if they satisfy the law of the place of execution. By some statutes wills are sustained if they satisfy either the formalities prescribed by the law of the testator's domicile at the time of execution or those of the forum.

Within the domain of the law of persons and domestic relations (family law) the law of domicile plays a preponderating role especially in Anglo-American law. In other countries the law of nationality has sometimes been substi-

tuted for that of domicile. These matters are often referred to as relating to status. In many countries the capacity of a person to enter into legal relations is deemed to be a part of status. The disability imposed upon a person by his personal law is deemed to be for his protection, which should not be lost by going into another state. In business matters, however, the courts of such countries do not always live up to this mode of reasoning; for in the interest of security in commercial transactions parties under disability under their personal law are held on their contracts entered into within the state if they had capacity to bind themselves under the local law, at least if the other party was ignorant of the fact that he dealt with a person from another state. In the United States it has been found inconvenient, in view of the migratory character of its population and the uncertainties connected with the subject of domicile, to determine the capacity of parties in commercial transactions with respect to the law of their domicile. It has been abandoned therefore in favor of the law governing contracts in general.

The validity of a marriage is everywhere determined as to the mode of celebration by the law of the place of celebration. In other respects it is generally governed by the personal law of the parties, although in the United States the law of the place of celebration governs. The policy of upholding marriage has inclined American courts to look to this law rather than to the law of the domicile of the parties, which would invalidate a marriage if the provisions of the law of the domicile of either party before the marriage were not satisfied.

Legitimacy is generally governed by the personal law of the parties; in the United States by the law of domicile. The same rule is applicable to legitimation. Troublesome questions arise if the parties in question have different domiciles or where there has been a change of domicile between the time of the birth of the child and the act subsequently relied upon for the purpose of legitimation. Adoption is governed by similar principles. If adoption takes the form of a judicial proceeding and the parties have different domiciles, such proceedings may generally be brought in the state in which either the child or the adoptive parent is domiciled.

The effect of marriage upon the property rights of the parties is determined in the United States as regards real property by the law of

the situs. Personal property owned by the parties at the time of their marriage is controlled in this particular by the law of the domicile at the time of marriage. Subsequent acquisitions of personal property, while the parties retain the original matrimonial domicile or after the acquisition of a new domicile, are said to be controlled by the law of the domicile of the parties at the time of such acquisition. In the decided cases, however, the property has generally been situated in the state of the domicile. Where it is not so situated, it has been suggested that the law of the situs should prevail. On the continent and in England it is deemed to be in the interest of society that the matrimonial property rights of the parties should be subject to one law throughout their married life without regard to any change of domicile or nationality or the nature of the property as real or personal. There is a tendency on the continent to apply the law of the husband's nationality at the time of the marriage. In some countries, as in France, the law goes so far as to prohibit the parties from changing by any subsequent agreement the matrimonial property regime adopted at the time of the marriage.

A divorce will be granted in the United States if the petitioner satisfies the law of the forum as to residence and grounds for divorce. A married woman may obtain a divorce on these conditions, although the husband is not before the court and is not domiciled in the state of the forum. But under English and continental law a married woman is not allowed to acquire a separate domicile. A divorce will not be granted in continental countries unless the personal law of the parties recognizes divorce and a cause for divorce under such personal law exists.

The relations between guardian and ward are subject to their personal law, that is, in Anglo-American countries, to the law of their domicile. The powers of a guardian are in Anglo-American law strictly local. The disability imposed upon a person of age by the appointment of a guardian is likewise local in its operation and does not follow such person into another state. The civil law countries follow a different doctrine.

So far as procedural matters are concerned all countries apply the law of the forum. Justice cannot be administered except in the mode that is customary at the forum. Although the guiding principle is clear, it is, however, not always easy to draw the line between matters

that are procedural and those that are substantive. For example, are matters relating to the burden of proof, to presumptions, to the statute of limitations and to the statute of frauds to be governed exclusively by the law of the forum on the ground that they are procedural? In Anglo-American law the courts have gone very far in this direction, but the more recent tendency is more moderate.

To all the above rules there are many exceptions or qualifications. The principal one is that the application of foreign law will be refused if it would shock the conscience of the court or conflict with some provision of the local law which the courts deem mandatory even with respect to situations that occurred outside the territorial limits of the state. For example, a contract valid in the state where it was made and where it was to be performed may not be enforced in another state if it arose out of a gambling transaction, if the kind of gambling involved is condemned by the law of the forum. In England, but not in the United States, a tort committed in another state will not be enforced if it would not constitute a tort under the local English rules. If a divorced person, prohibited by the law of the state of his domicile to remarry for a certain length of time, does so in another state, the former state may not recognize the marriage although validly celebrated according to the law of the latter. A state condemning chattel mortgages as against public policy may and probably will decline to recognize such mortgages validly executed in other states after the property is brought within its jurisdiction.

So far as the United States is concerned the conflict of laws is further greatly complicated by the fact that the states are restricted by some provisions of the federal constitution in their freedom to choose their own rules of the conflict of laws. The principal limiting clauses are that each state give full faith and credit to the public acts, records and judicial proceedings of every other state; that no state deprive any person of life, liberty or property without due process of law; and that the citizens of each state be entitled to all the privileges and immunities of citizens in the several states. Under the full faith and credit clause and the due process clause of the constitution, with or without supporting legislation on the part of Congress, it would be possible for the Supreme Court of the United States to impose upon all courts of this country its views as to what the rules of

the conflict of laws should be, but thus far it has declined to exercise such power. As regards the choice of the ordinary rules of the conflict of laws the Supreme Court appears disposed to give to the state courts entire freedom except where it is necessary to check legislation which is deemed especially obnoxious.

Another source of complication in the United States arises from the coexistence of state and federal courts. Although a given factual situation has arisen in some other state or country, a federal court may decline to look to the law of such state or country and apply its own rules on the ground that the particular matter is one of general instead of local law. On this ground the federal courts have refused to enforce stipulations against negligence by carriers contained in bills of lading issued in foreign countries, although such stipulations were valid under the law of the foreign country.

Attention has been called to but a few of the problems presented by the subject of the conflict of laws. These problems will disappear as uniformity in the municipal law of the different states and countries is achieved. Some progress in the direction of such uniformity has been made in the United States in the field of commercial law, but relatively little in other fields. As between the nations of the world strenuous efforts have been made to get some degree of uniformity in matters most directly affecting foreign commerce, such as in the law of bills and notes, sales, carriers, shipping and the like, but the difficulties in the way are still very great. Other efforts have related to the unification of the rules of the conflict of laws in the different countries. Among the continental countries some progress has been achieved in this direction through the conventions at The Hague on private international law. As a result of the recent codification of the subject at the Pan-American Conference in Havana a similar development has taken place in Latin American countries. The Anglo-American point of view, however, is so different from that of other countries that England and the United States find it difficult to join in such attempts at unification. So far as the latter country is concerned, the restatement of the conflict of laws by the American Law Institute may constitute a unifying influence, but it is hardly to be expected that it will affect materially the law of other English speaking countries.

CONFLICT, SOCIAL. Social conflict results from the conscious pursuit of exclusive values. In the widest sense of the word conflict is conscious competition, and competitors become self-conscious rivals, opponents or enemies. The individual members of society are always widening or narrowing the sum of their claims on society for life, liberty of movement, property and deference. For the most part the relative position of the individual in relation to the current values is controlled by influences of which he is unaware. But in some measure everyone believes that his personality can and should be protected from the encroachment of

others and that it can be aggrandized at the expense of others. Conflict may involve the defense of what one already has or the acquisition of what one has not; and acquisition may mean the taking away of that which pertains to another or the appropriation of that which another would like to have. The defensive, destructive and obstructive aspects of conflict become entangled with one another in every crisis.

Exclusive values may be pursued by means which vary from physical violence to persuasion, thus including the whole armory of instrumentalities for social control. Conflict among men differs from the struggle for survival among animals in the diversity of the means employed. Each animal species is bound by its structure to a small number of highly stereotyped means of coping with a conflict situation, but so plastic is the nature of man that rich variations are discoverable within the human species. The place of physical combat is usually taken by argument, admonition, ridicule, litigation and the manipulation of surrounding circumstances; and these are functions of the cultural setting in which conflicts occur. Although the instinctive nature of man is in principle non-social and in important particulars antisocial, man is capable of socializing his destructive impulses to a very high degree.

It may be considered a truism that social conflict is a mode of registering, and often a mode of consummating, social change. Conflict is acute where change is swift, and here the vested interests and sentiments of the old order stand out against eager pressure from the new. A crisis may "clear the air" and bring about a willingness to come to terms with the requirements of reality. Mobs, strikes, boycotts and wars have not infrequently led to a more permanent organization of interests, and social tension has often subsided after prolonged agitations and protracted litigations. After a "stand" the legionaries of the old may retire with honor from the field and leave the new in full command. Occasionally a crisis results in the obliteration of one or both contending parties.

That a particular conflict will produce a relatively abiding settlement is no foregone conclusion; it is often said that issues are never decided, they are only superseded. National cleavages push religious cleavages into the background, and class divisions threaten national unity. But behind the clash of armor and argument are the silent processes of social life, which redefine the value pyramid and eventually display themselves

in new frontiers of strife and controversy. Innovations in the technique of production and the resulting enrichment of the adventurer and impoverishment of the beneficiary of the older order fit up the stage and rehearse the characters for the next act in the social drama. Against the prominent practises and symbols of the present order accumulates a mass of repressed hostility, and from within the framework of society itself there springs the dialectic of its alteration. Certain realignments may suddenly appear, as when an instant and overwhelming threat to a common value looms in the immediate foreground and men combine against it where they have been unable previously to combine for anything else. The whole catalogue of contrasts between individuals furnishes possible lines of separation, but the zones of conflict at a given phase of culture are circumscribed by geographical position and by the incidence of social change within the institutional structure. Not only the parties but also the modes of conflict are prearranged by the conventions of the group.

The thinkers of the last century were so aware of the clash of nation, culture, party and industry, so impressed by the biological struggle for existence, so struck by the mechanical analogies drawn from the study of flying particles, that they were disposed to take the fact of conflict too earnestly. Usually their philosophies were used to support some militant program on the part of those who had grown impatient of sublimated forms of social settlement. Even the philosophy of the democratic state was strongly tinged by this ruling preoccupation with the fact of conflict.

In a certain sense the "philosophy of compromise" is in itself a curb on the tendency to resort to coercion rather than discussion; but from another point of view it is fatalistic and negativistic, for it seems to concede in advance that there is no truly inclusive set of social aims in relation to which local differences may be conciliated. A compromise is by its very nature a crazy quilt in which everyone can identify his patch; he can find consolation for his disappointment by reflecting that everyone else is disappointed too. In some quarters the philosophy of compromise has tended to pass over into a philosophy of integration. The solution of a conflict by integration is a redefinition of the interests involved; the parties cannot identify their "wins and losses." Such a conception is affirmative and challenging to those who hold

social power, for it dares suggest that perhaps no social conflict is so serious that creative intelligence may not economically resolve it. Men who are in the center of wars, feuds and elections usually develop a cynicism which springs from their own incapacity to exercise much control over the course of events. The philosophy of integration is a philosophy of hope, but its effective application depends upon its timely, that is to say upon its preventive, application.

One of the most pervasive patterns of thought conceives of conflict in personal terms. But there is a way of thinking which transcends social conflict and prepares the road for collaboration in the mobilization of effort against the non-human enemies of man. More men are killed by pathogenic bacteria than perish from bullets, yet the imagination of mankind has not yet been kindled against the invisible enemies of the species. It may be that the manipulation of collective opinion for the sake of raising the prestige of science will contribute toward the achievement of this sense of unity of man with man. It may be possible to dramatize the plight of man as a lonely adventurer adrift on a speck of dust in the unplumbed vastnesses of celestial space and thus to arouse a sense of the ludicrousness of internecine strife and place a premium upon sublimated forms of conflict.

If mankind succeeds in reducing fighting to a minimum on behalf of collective entities like states and classes, will personal rivalries increase? Historically liberty has often been sacrificed to authority in the presence of a violent common threat. Rivalries for personal distinction have been directed to more than personal ends, through the identification of the individual with the fate of a collective symbol. If conflict declines in its most peremptory collective forms, it is thinkable that the expenditure of human energy on long run ends might diminish. The fighting crisis provides a fairly definite standard for measuring the value of human effort. The measurement of economic efficiency, however, is at least as definite, although it has historically failed to inflame the imagination of the community. Wherein lies the superior claim of fighting to be considered sacrifice? Crises of fighting are intermittent; they are dramatic and they mean the gratification of very powerful primitive desires. The production of wealth is a continuing problem and it involves the relative subordination of impulse to the calculation of interest. It may be that in the American cult of

prosperity we have the evolution of a social objective which may eventually have much of the powerful sanction which clings to military action; although it may be that the dramatization of the struggle for prosperity will always fail to gratify human impulses, which, to find sublimation, will have to be diverted into vicarious orgies of popular art and sport.

CONFORMITY, according to its dictionary definitions, implies an initial difference which is molded into similarity or sameness. It presupposes a model or standard serving as a mold to which the conformist conforms. His attitude is one of considered and voluntary submission, adaptation and compliance; his purpose is to bring about a harmony of himself with the model. It is assumed, first, that the conformist is plastic and active, the model rigid, passive, inert; and, second, that the conformist is always an individual or a minority, the model always a majority, community or group, with its folkways, fashions, conventions, institutions and mores.

These assumptions are not altogether true. Occasions arise, especially under conditions of crisis and change, such as great natural catastrophes, important inventions like that of automatic machinery, or political revolutions, when the standard or model is an individual or a minority (the Russian Communist party, the

Young Turks) and when it is itself as plastic and active as the conforming majority. Again, fashions are set by individuals (the beaux of the eighteenth century, for example), and what is *de rigueur* is always the initial practise of a small group to which it does not matter and which makes the change because it is bored. Inertia in small groups or in society as a whole relaxes the force that transforms them inwardly, so that even "static" societies do have a history. In point of fact, the standard or model changes in itself and is changed by the conformist in conforming. The action involves a mutual give and take, and the total result is never a mere repetition of the same but a *tertium quid* somewhat different from both. For example, the conformation of the Roman Catholic establishment in the United States to the mores of the American social-political order has set up in that church practises (condemned in the encyclical *Pascendi dominici gregio*, September 8, 1907, as the heresy of Americanism) and views on the relations of church and state which the Curia cannot accept.

The drives making for conformity are various, ranging from immediately felt discomfort in the sense of one's own difference to a fear for one's property, reputation or life. Anxiety is usually a component of such drives although they play presupposes a certain degree of security, for where insecurity is felt to be radical, revolution is as likely as conformity. Conformity is never reflex, automatic and spontaneous; it is purposeful action, taken contrary to preference or belief, an acquiescence with reservations and not to be confused with the unconscious processes of conformation and assimilation resting upon suggestibility. Infants and children cannot be said either to conform or not to conform, since they have only wishes and impulses but not beliefs, preferences or convictions from which they might choose to deviate. Conformity begins where conscious choice can be made of action contrary to belief. One does not conform to the folkways and mores in which one grew up; one only dissents from them, as the Mormons did when they were openly polygamous. But one can conform to folkways and mores of an alien civilization, as do missionaries who naturalize Christianity by adapting its rituals, myths and symbols to those of the infidels they are saving. Orientals conform when they adopt the dress, table manners and sex ways of occidentals. And vice versa. Aliens who "naturalize" themselves conform.

This points the significance of conscious

choice in conformity. Historically, the term and its derivatives stand out in connection with church and state, institutions in which doctrine and statute bulk most large. "Nonconformist" is an ecclesiastical term; when the dissenter conforms, John Locke asked in his *Second Letter on Toleration*, does he do so upon reason or conviction? "Conforming" then consisted in adhering to the established church as required by the Acts of Uniformity of 1551-59 and 1662, which prohibited all other ecclesiastical allegiance. If in order to stay in his church a man doubtful of these doctrines nevertheless acquiesces in the Virgin Birth or the literal inspiration of Scripture or papal infallibility, he conforms. The Maranos who practised Christianity but believed in Judaism were conformers. Galileo and Descartes were conformers. The agnostic or freethinker who sends his children to Sunday School conforms.

A similar situation exists in relations between individuals and groups and the state. It is conformity to obey the law merely because it is the law. The convinced wet who lives dry conforms. Italian acquiescence in Fascist rule is conformity. The service of Russian intellectuals under communism is conformity. Every way of "getting on the bandwagon" is conformity.

Is then conformity merely another name for hypocrisy? No. Hypocrisy is intentional deception regardless of coercion. Conformity is voluntary adjustment to a social environment over which one has no control. It is reaction to explicit or implicit coercion. If it be evil, it is necessary evil. Its synonym is compromise. From the point of view of all the interests involved in the process conformity is such a making of terms with what cannot be overcome that the different, the variant, by submitting to regulation and modification preserves itself, is not totally destroyed. By conforming the weaker integrates itself with the stronger and joins its qualities to those of the whole. The process becomes dangerous where it leads either to complete repression or extirpation of those qualities. Then ensue individual hypocrisy, political corruption, social disorder and secret revolutionary movements which ultimately become open and combative dissent. Normal conformity both conserves the variant and modifies the type. Thus pacifism is a social variant. Its influences upon the conventional attitudes toward war and peace have been due not to the irreconcilable but to the conforming pacifists. These have suffused public policy with a new sentiment and given a novel

objective to international relations. By compromising with the passions that make for war they have to a slight extent opened up a way to the control of those passions.

HORACE M. KALLEN

See: SOCIETY; SOCIAL PROGRESS; CULTURE; BELIEF; COERCION; COMPROMISE; OPPORTUNISM; CUSTOM; LAW; CONVENTIONS, SOCIAL; FASHION; ASSIMILATION, SOCIAL; CIVIL LIBERTIES.

CONFUCIANISM. This term, invented by European writers, covers roughly what is implied in the Chinese word *ju-kiao* (the teaching of the *ju*). Confucius (Kiung Tzu 551-479 B.C.) was one of the paid public teachers (*ju*), more or less similar to the sophists of ancient Greece, who were common in China during the sixth and fifth centuries B.C. He spent many years of his life as a public official, was a historian of importance and did his great work as a teacher. Not a philosopher in the ordinary technical sense, he was concerned with drawing up a set of rules for human conduct rather than with the elaboration of theories.

In later times because of the tremendous influence of the school of Confucius the name *ju* came to be used to denote his followers as distinguished from Taoists and Buddhists. And *ju-kiao* became synonymous with the religion of the Confucianists of all ages, including the teaching of Confucius and his early followers as well as the later developments.

Confucius although under the influence of sixth century naturalism was historically minded and a cautious thinker and found it difficult to discard all traditional values. His philosophy was a compromise. Whereas Lao Tzu's naturalism was radically nihilistic, denying God and knowledge, Confucius taught agnosticism, worshipping the gods and spirits "as if they were present." Lao Tzu condemned government, advocating *laissez faire*; Confucius opposed only "bad" government and tried to formulate correct principles of governing. Whereas Lao Tzu condemned civilization and knowledge as leading to evildoing, Confucius exalted the importance of learning and education as against abstract thinking. Whereas Lao Tzu was highly individualistic, Confucius based his moral philosophy on human relationships—the relation

between father and son, between man and wife, between elders and the young, between friend and friend and between ruler and subject.

Confucius has been called the father of Chinese history, not because he was the first known author of a history of his native state but because of the importance he attached to preserving and studying the literary records of the history, institutions and traditions of the ancient Chinese. These records, notably the Book of Odes, the Book of History, the Book of Change and the *I Li*, became the "Old Testament" of Confucianism. The *Analects*, which record his sayings and those of his disciples, the Book of Mencius (Meng Tze 372-289 B.C.), and a few other works of uncertain authorship (e.g. the Book of Filial Piety and the *Chung Yung*) form the "New Testament" of Confucianism.

Confucius founded no religion. Contemporary testimony is to the effect that his immediate followers were frankly atheistic. Nevertheless, they laid the basis for a religion on thin precepts of filial piety. They taught three grades of filial piety: the highest ideal was to glorify one's parents by one's own effort and action; next, not to degrade their name; and lastly, to give them support and comfort. "Our body is inherited from our parents. How dare we carry on this inheritance without reverence? It is undutiful for a son to live irregularly, to serve his government unfaithfully, to conduct public duties dishonestly, to be unfaithful to his friends, or to be cowardly on the battlefield. Any one of these five failures in life will bring disaster or dishonor to his parents. How dare we live without reverence?"

Filial piety becomes a real religion when one is taught "not to move one step without thinking of one's parents, not to utter one word without thinking of one's parents." The memory of parents took the place of reverence for a deity usual in other religions; conduct was to be guided by the sense of responsibility to them or to their memory. Morality was to radiate from this sense of reverence and love for one's parents. "He who loves his parents hates no man; he who reveres his parents is discourteous to no man." Thus was founded the religion of Confucianism without a belief in God or the gods.

But the religious beliefs of ancient China soon began to creep into this new religion, which because of its highly intellectual character could make no mass appeal. As Judaism survives in Christianity through the Old Testa-

ment, so the old religious ideas and practises of ancient China were perpetuated through the ancient pre-Confucian classics preserved and taught by the Confucian school. When the Emperor Wu Ti (140-87 B.C.) elevated Confucianism to the position of the national religion of the empire, it had already incorporated all the traditional beliefs and superstitions of ancient China which such naturalistic philosophers as Confucius had tried to destroy or to purify.

The cardinal doctrine of Confucianism as a state religion was the idea that the God of heaven is teleological and that the "will of God" may be influenced by the action of man, in particular by that of the emperor. As a philosopher of the second century B.C. expressed it, "the action of man, when it attains a certain level of goodness or of evil, will flow into the universal course of heaven and earth and will cause reciprocal reverberation in their manifestations." Evil acts of the government will bring forth warnings from God in one of two forms: catastrophic phenomena, such as earthquakes and mountain slides, or strange anomalies, such as eclipses of the sun and comets. Whenever such a catastrophe or anomaly occurred, it became the duty of the Confucian scholar to interpret its meaning and present a memorial of warning to the emperor. Since these natural phenomena were often capable of diverse interpretations, there developed a science of Confucianist casuistry, to the exposition of which the great historian Pan Ku (32-92 A.D.) devoted over two hundred pages in his *History of Han* (bk. xxvii).

Absurd and superstitious as this new Confucianism was it nevertheless had its humanizing effects. It was the only means by which the scholarly class in an age of absolute despotism could fight tyrannical rulers and check their powers in the interest of the people. In their political thought Confucius and Mencius were socialistically inclined. Both laid down principles of humanitarianism and benevolent rule by the wisest members of society in a sort of Kantian republic. Confucius opposed price raising by private or fiscal monopolies and favored government regulation of prices, loans, free granaries, aid to transportation and state relief for orphans and the aged in addition to private charities. Taxes were to be equal and universal. Confucius approved an income tax and opposed customs tariffs. Mencius in particular stressed the importance of heeding the voice of the people. He devoted much attention

to the problem of land distribution, conservation through closed seasons and other aspects of economic life. He laid down the doctrine that when crime is the result of poverty punishment is improper and that responsibility for such crime rests with the ruler. The later Confucianists carried on this tradition and from time to time brought about political and economic reforms on principles laid down by Confucius and Mencius.

An important distinction between Confucianism and many western philosophies and religions on their political side is the universality of its doctrine; the object of government is the entire earth and all its inhabitants, not any single local or national group. Another difference is the attitude toward consumption and production. While Confucius lays down many regulations for facilitating the latter he reflects in his attitude toward the former the ideal of satisfying the pressing needs of all before permitting increased consumption by privileged individuals, an ideal which was typical of the family-agrarian economy of China.

During the mediaeval period Confucianism was not thought of as a religion, for in this respect it had long been overshadowed by Buddhism and Taoism. But it continued to produce the scholars, officials and statesmen who carried on the functions of the government and the state. It played a part similar to that of Greco-Roman culture in mediaeval Europe, with the important difference that while in mediaeval Europe the scholar had no way of social advancement except through the church, the Chinese system of civil service examinations enabled the Confucianist scholars themselves to control the channels of civil and social advancement. Buddhism for the salvation of the soul, Taoism for contemplation but Confucianism for the ordering of society and government.

From time to time Confucianist scholars attempted to rid China of Buddhism. The famous writer Han Yu (768-824), for example, proposed this formula of persecution: "Restore all monks and nuns to lay life, burn their books and convert the monasteries to human dwellings." In 845 the government actually carried out a most drastic persecution of Buddhism, destroying over 40,000 monasteries and forcing over 260,000 monks and nuns to return to lay life. But Buddhism soon recovered and its great masters, the *Zn* (*ch'an* or *dyana*), continued to influence the nation's religious and intellectual life for several centuries.

The moral and political philosophy taught by Confucius and Mencius was simple as compared to the complicated machinery of Buddhist psychology, logic and metaphysics. For over eight hundred years Confucianism produced no original thinker of first importance. It occupied itself with practical affairs, having yielded speculative thinking to the Buddhist schools. After long centuries of Buddhist domination there arose under the Sung dynasty a new Confucianist philosophy whose chief representatives were the brothers Ch'eng Hao (1032-85) and Ch'eng I (1033-1107), Lu Kiu-yuan (1130-92), Chu Hsi (1130-1200) and Wang Yang-ming (1472-1528). They sought to work out a Confucianist cosmology, psychology and logic as the basis of a moral and political philosophy, which has become known as neo-Confucianism.

Neo-Confucianism is classical Confucianism reinterpreted in the light and under the influence of the Buddhist and Taoist mediaeval religions and contains many elements taken from them. Unlike classical Confucianism it is esoteric and speculative; it exalts meditation and quietism. Its attitude toward moral questions is far more rigorous and puritanical than the humane teachings of Confucius and Mencius. While it made no protest against the system of concubinage and the vogue of foot binding which was arising at the time, its great teachers condemned the remarriage of widows. "To die of starvation is a very small matter but (for a widow) to lose chastity is a very great sin."

Despite these marked traces of mediaeval heritage neo-Confucianism represented the historic tendency of China seeking liberation from the otherworldliness of mediaevalism and a return to the more practical problems of the individual, family and the state. It represented the movement to secularize thought and society. Its esoteric meditation, its study and speculation, were not directed to the attainment of arhatship or Taoist longevity but to the perfection of the individual so he might be better fitted to serve society and the state.

Although neo-Confucianism was at first persecuted by the government because of its uncompromising opposition to some political leaders of the time it spread rapidly and gained a great following. Buddhism and Taoism ceased to command the interest of the intellectuals and gradually died a natural death, surviving today in China merely as the superstitions of the ignorant. Since the fourteenth century Con-

fucianism, patronized by the emperors, has become the orthodox moral and political philosophy of the educated class. For over five hundred years, from 1400 to 1900, the commentaries of Chu Hsi on the Confucian classics were used in all schools and all civil service examinations. Written in lucid and simple language, these texts have had tremendous influence in popularizing the moral and social teachings of the Confucian school as reinterpreted by the Sung philosophers and they have colored all Chinese institutions.

Neo-Confucianism developed in a united empire of absolute rule and as a political philosophy failed to grasp the democratic spirit of classical Confucianism and tended to strengthen the hand of despotism. One of the Sung philosophers said that "parents can do no wrong"; by analogy this dictum has become the unconscious basis of a political philosophy that emperors can do no wrong. In this sense neo-Confucianism has well deserved centuries of imperial patronage. It has been responsible, on the one hand, for long periods of comparative political stability and, on the other, for a lack of political and intellectual freedom.

In the early years of the twentieth century there were some attempts to revive Confucianism and reinterpret it in the light of modern life and thought. After the founding of the Republic of China there was a feeble movement to establish Confucianism as a state religion (partly in the hope of using it as a bulwark against foreign influence) or, failing that, to make it the national system of moral teaching in all schools. But these efforts soon ceased and by an order of the ministry of education official sacrifices at the temple of Confucius were officially abolished in 1928.

From China Confucianism spread to Korea and thence in the third century of the Christian era to Japan. Official schools were opened in the seventh century, and later Confucius attained the stature of a divinity. While its cultural influence was great, Confucianism as a cult never attained the mass support given to Buddhism in Japan. An essential transformation of Confucian teachings took place on Japanese soil, where the importance attached to the family as the institutional basis of life and to filial piety as a virtue were translated into an emphasis on the institution of the state and loyalty to the ruler.

CONFUCIUS. See CONFUCIANISM.

CONGRESSIONAL GOVERNMENT is a term commonly used to describe that type of government which separates the executive from the legislature and makes each independent of the other. The best example of congressional government is that found in the United States. It is frequently called presidential government but under either name is in striking contrast to cabinet government, which has an executive chosen by and responsible to the legislature.

Little conscious intent underlay the development of congressional government in the United States. Many of the results of the evolution were not only unanticipated by the framers of the

constitution but have not been striven for by later statesmen. Montesquieu, as Madison said was the oracle who was cited in the Federal Convention. The French political philosopher, misinterpreting transitional constitutional developments in Great Britain, ordained the separation of governmental powers to prevent tyranny. Colonial experience seemed to support this principle. The theory of checks and balances was generally accepted. Consequently Congress and the executive were made independent of each other.

The draftsmen of the constitution were sincerely anxious to prevent the tyranny of majorities and that purpose underlies the constitutional arrangements which were set up. As *The Federalist* (no. li) declared, while all authority would be derived from the people "the society itself will be broken up into so many parts interests and classes of citizens that the rights of individuals or of the minority will be in little danger from interested combinations of the majority." Thus the House of Representatives was to be elected by the people with suffrage qualifications determined by the states. The senators were to be elected by the state legislatures. An electoral college, the members of which were to be chosen as the states should see fit, was to choose the president. Judges were to be appointed by the president and confirmed by the Senate. The terms of office were arranged so that gusts of passion would be ineffective a four-year term for the executive, a two-year term for representatives, a six-year term for senators with one third of the membership elected every two years and life tenure for the judiciary. It was expected that the House of Representatives, fresh from the people, would be more powerful than the Senate and that the upper chamber would be a sort of executive council to act with the president.

These provisions have not been copied in their entirety by countries (principally those in Latin and South America) which have based their political institutions on the congressional model. An executive independent of and not chosen by a legislature, which cannot be dissolved before the expiration of its constitutional term, is sufficient to warrant the description "congressional government." The arrangements cited, however, have been decidedly influential in determining the character of congressional government which the United States has had.

One arrangement quite unexpected by the framers of the constitution—the development of

political parties with elaborate organizations—has been equally influential. These parties, to adapt Bagshot's description of the British cabinet, have been the buckle which fastens or the hyphen which joins the American executive and legislature. Needless to say, the buckle can be and sometimes is more powerful than the things which it fastens. For congressional government in separating president and Congress has meant that political parties are organized outside of the government and that they are able to dictate decisions to its several branches.

In the eighties there was much discussion of the possible introduction of cabinet government in the United States. The leader in this debate was Woodrow Wilson, who in an article written while he was an undergraduate at Princeton University had argued for the introduction of the cabinet system under the constitution. Strongly influenced by Walter Bagshot and applying the doctrines of *The English Constitution* (London 1867, rev. ed. New York 1911) to American conditions Wilson amplified his argument in his *Congressional Government*. In this book he showed more clearly than had any previous writer the difference between the theory of the constitution and the reality of the government. For the first time he stressed the point that congressional government means committee government. His proposal was for the gradual development of a constitutional tradition that a cabinet should resign if it failed to have the confidence of the House of Representatives. If this were done the president would of course become more of a figurehead and approach the position of a titular executive. Manifestly also the House would be more powerful than the Senate since, as British experience has demonstrated, a cabinet cannot serve two masters (although politics in France sometimes suggests the contrary principle).

The only concrete result of this advocacy was a report by a Senate committee that members of the cabinet be given seats in Congress but without votes and without any obligation to resign if their proposals were rejected or their acts censured. Similar proposals are still made outside of Congress but with more and more infrequency and with little official support. That administrative efficiency would be increased and congressional information be made more exact if cabinet members appeared in Congress seems almost certain. Although the good might be meager it is difficult to see how

any harm would result. The suggestion, however, excites enthusiasm neither in the executive departments nor in Congress. The executive is reluctant to consent to the annoyance which congressional appearances would entail. Congress has a curious idea that the presence of secretaries would be an encroachment on legislative prerogatives. It is maintained also that speaking ability would come to be a qualification for cabinet appointments. Non-insistence on such a qualification does not seem to have made the administrative gifts of American cabinet members superior to those of ministers in a cabinet system which requires some measure of prowess in the parliamentary arena.

An indictment of congressional government, in theory at least, can contain many counts: (1) there is no effective leadership like that which a legislative assembly gets from a cabinet executive; (2) deadlocks are possible; (3) responsibility is confused; (4) with the executive not appearing to answer for itself to the House and the Senate, Congress is inclined to attempt to control administration by minute legislative regulations; (5) lobbies are encouraged because they can bring pressure on individual legislators and need think of the executive only with respect to a possible veto; (6) local interests are considered more important than national policies; (7) the electorate can never vote when issues are ripe for submission but must wait until the calendar says that an election is due; (8) blocs which influence and even determine legislation are encouraged to a far greater extent than under cabinet government; (9) the ability of legislators may be lower because they cannot look forward to cabinet preferment.

Despite these serious theoretical defects, however, one can hardly say that the United States has lost greatly in efficiency because it has had congressional rather than cabinet government. It may be, as Lord Bryce once suggested, that the Lord looks out for infants, lunatics and the United States; but American problems and conditions have been somewhat unusual. Federalism would have made cabinet government more difficult than it is in a unitary system. To be sure, Canada and Australia have responsible cabinets, but in the former country there is no federal upper chamber and in neither is there the range of economic and sectional problems to be found in the United States. As a federal second chamber the American Senate would have refused to become a secondary chamber. Nor is it easy to see how a cabinet

system could successfully function without impairing the American doctrine of judicial supremacy.

Congressional government, finally, makes the presidency the one great prize of American politics. Control of Congress is relatively unimportant. A group of representatives or senators belonging to a third party, advocating their own proposals and influencing legislation, is rarely striven for. Such a group would be impotent in comparison, say with the Independent Labour Party in Great Britain before the war. Parties in the United States amount to little or nothing unless they have a chance to secure the presidency. Congressional government is thus decidedly hostile to the growth of third parties. Not the opinions of the electorate but the structure of the government is the great bulwark of the two-party system.

The result is an unreality of political issues. Cabinet government in the United States, on the other hand, would undoubtedly mean a large number of sectional and other parties. Cabinets would almost certainly have to be coalition cabinets. The theoretical advantages of cabinet government would dwindle as they do on the continent of Europe where the multiple party system is common. A courageous president—for example, Roosevelt or Wilson—can give Congress much of the leadership which it needs. Parties and politicians can allow the electorate to pronounce on real issues instead of on a hodgepodge of carefully phrased evasions. In short, in analyzing a particular form of government one should not be unmindful of William Penn's dictum: "Governments, like clocks, go from the motion men give them; and as governments are made and moved by men, so by them they are ruined too."

CONIGLIANI, CARLO ANGELO (1870-1901), Italian economist. He studied under Cossa and Ricca Salerno and while still young was chosen to fill the chair of political economy in the University of Modena, where his career was short but most successful. Of an enthusiastic and generous nature, he actively encouraged many fruitful projects to aid the laboring classes and was a constant champion of free love of conscience. His writings on controversial economic questions are thorough and vigorous. His first work, *Teoria generale degli effetti economici delle imposte* (Milan 1890), discusses the knotty problem of the shifting and incidence of taxation, with conclusions based on the theories of the Austrian school. Invited by Wollemborg to study the question of the revision of the local tax system, he published a voluminous and scholarly work, *La riforma delle leggi sui tributi locali* (Modena 1898). In this work he discusses with acumen the problems relative to the taxation of provinces and communes, with constant reference to the legislation and financial institutions of the most advanced countries, and adds concrete recommendations for a comprehensive reform. In the scientific reviews he wrote numerous articles on the subjective basis of exchange, profit, capitalistic economy, unemployment, the labor movement and various financial questions, which were collected after his death and published as *Saggi di economia politica e di scienza delle finanze* (Turin 1903) with a preface by Professor Graziani.

CAMILLO SUPINO

CONJUNCTURE, a term borrowed from German economic literature, may be broadly defined as the totality of uncontrollable and variable market conditions. Denoting originally an astrological or astronomical conjunction the word came to be used in seventeenth century Germany in the sense of a meeting of circumstances or events. Later its use became restricted to business circles, where it signified the temporary condition of the market, and was adopted from them by writers on economic subjects. The history of this term in German economics is illustrative of the evaluation through which that science has passed.

Lassalle, who appears to have been the first

economist to use it, Schäffle and Wagner emphasize in employing this term the independence of the totality of market conditions from the actions and aspirations of the economic agents. The assertion of the dependence of business men upon conditions not of their making involved a criticism of the atomism of classical economics, for the latter ignored the organic interdependence of economic processes and maintained that all profits are earned gains. It is interesting that when the term appeared in English economics at the end of the century it was given a restricted interpretation. J. S. Nicholson identified conjuncture profits with gains due to luck or audacity, while Alfred Marshall in his discussion of profits, earnings and quasi-rent attached significance only to changes in conjuncture or the environment and the opportunities which the latter offers.

With the spread of the historical descriptive method of economic study and an increase in the number of monographic studies of the various aspects of conjuncture in Germany, the concept suffered a slight but significant change in meaning. The emphasis now was not on the independence of the market from the individual but on the incalculable variability of market conditions, which in the simultaneous oscillations of supply and demand presented a puzzling problem from the point of view of equilibrium economics.

Because of its vagueness the term has proved susceptible to a number of interpretations to suit the particular needs of the theoretical constructions in which it has been incorporated. Sombart, for example, means by conjuncture the strictly economic causative factors in the market situation, thus eliminating the incidence of natural forces and of social conditions. W. Röpke, on the other hand, understands by conjuncture the sum total of conditions which affect through the market, and only in so far as they thus affect, the profit yield of private enterprises. Finally, statistical economists use the term to distinguish unpredictable transitory economic changes from changes of a fundamental, long run character or from regularly recurring oscillations such as steady seasonal variations. In this sense conjunctural fluctuations are contrasted with structural transformations. The term is also employed in combination with a number of restrictive modifiers in such phrases as general conjuncture, special conjuncture, price conjuncture, credit conjuncture and the like.

While this term is widely used in German speaking countries, Scandinavia and Russia, in the American and English literature the term cycle is uniformly preferred with the result that the emphasis is placed not on the congeries of conditions displaying variability but on the character of the external manifestations of this variability. This difference in emphasis is to be explained in part by the earlier development of the statistical study of this subject and by the persistence in economic theory of the abstract isolationist approach in English speaking countries.

CONNOLLY, JAMES (1870-1916), Irish revolutionary socialist and nationalist. Connolly professed two creeds not usually found in combination: revolutionary socialism and intense nationalism. His early life was devoted to socialist propaganda in Great Britain, where he was associated with the Social Democratic Federation; in Ireland, where he founded the Irish Socialist Republican party in 1896 and edited its organ, the *Workers' Republic*, from 1898 to 1903; and in the United States, where from 1903 to 1910 he was associated successively with De Leonism, the Industrial Workers of the World and the Socialist party. In 1910 he finally returned to Ireland and in 1913 became prominent as James Larkin's right hand man in the great Dublin strike of the Transport Workers' Union. In the uprising of 1916 Connolly was leader of the Citizen Army; he was wounded, taken prisoner and executed.

Connolly's sympathies with the working class dated back to his youth, when he had seen and felt much poverty in the industrial districts of Great Britain. Two forces appeared to him to be the engines of exploitation of the weak; the Irish working class, oppressed by both capitalism and imperialism could not, in his opinion, be free until both had been destroyed. The principal point of his creed was that a mere political revolution without a social revolution would be of no advantage to the Irish working class.

Connolly disliked and distrusted the official Irish nationalist leaders, who represented the middle class which had "bowed the knee to

Baal." He believed that "only the Irish working class remain as the incorruptible inheritors of the fight for freedom in Ireland," and he therefore sought by his action in the uprising of 1916 to identify the causes of socialism and Irish nationalism. He was more of a socialist Fenian, however, than a Fenian socialist. His social ideal included the reattainment of what he believed to be the communist elements in the old Gaelic tribal system to replace the capitalistic landlordism maintained by English power.

Important works: *Labour in Irish History* (Dublin 1910), and *The Reconquest of Ireland* (Dublin 1915), reprinted as *Labour in Ireland* (Dublin 1917), with an introduction by Robert Lynd.

Consult: Clarkson, J. D., *Labour and Nationalism in Ireland* (New York 1925); Ryan, D., *James Connolly, His Life, Works and Writings* (Dublin 1924); McKenna, L., *The Social Teachings of James Connolly* (Dublin 1920).

CONQUEST may be defined as the forcible political superposition of one group upon another. It is to be distinguished from mere displacement, which takes place when a weaker group is driven from its territory by a stronger group which then occupies the vacated territory without political conquest of the weaker peoples. Displacement is a function primarily of the superior material culture and superior fecundity of the displacing group. In displacement biological and cultural factors are dominant and political aspects are minor or secondary.

One of the most striking examples of large scale displacement in modern times is that of the Indians of North America north of Mexico by peoples from northwestern Europe. This involved incidentally some very insignificant examples of conquest of Indian tribes by the white colonists, but typically the Indian aborigines retained their political integrity or sovereignty while at the same time they were excluded from participation in the social and economic life of their white neighbors. This story of displacement in upper North America is in striking contrast to the actual conquest of native peoples in Mexico, Peru and other great sections of Latin America, where the aborigines were not displaced and today still make up racially the bulk of the population.

The Japanese displaced the Ainu aborigines of Japan through a process very similar to that followed in the displacement of the North American Indians by the Europeans. Only in negligible instances was there in Japan any

actual conquest of Ainu groups and absorption of the Ainu population. An example of prehistoric displacement, evidenced by ethnographic phenomena, is that of the Negroid peoples of the Malayian islands. The Malay Archipelago, the Philippines and Formosa were once inhabited by the Negroid Negrito peoples. The Malayian occupation of these territories began perhaps about 1000 B.C. and proceeded gradually until today the Negritos survive only in ethnographic "pockets," principally on the islands of Palawan and Luzon in the Philippines. There does not appear to have been any conquest of the Negritos by the Malays nor any appreciable absorption of the Negrito peoples.

The simplest type of conquest is exemplified in the building up of empires of what we may call the king of kings type in the early Mesopotamian valley in the era when the Sumerian cities flourished (c. 3500-3000 B.C.). When one city-state conquered others it required of the conquered cities merely that their kings recognize the overlordship of the king of the conquerors and pay to the conquerors a stipulated annual tribute which was fixed in a sense by agreement. The conquered city retained its autonomy except in matters concerning foreign affairs and was bound to assist the overlordship in a military way.

Conquest of a similar simple type is found in some of the "leagues" and empires of the early Mediterranean peoples (c. 700-300 B.C.). The leagues and the empires cannot be sharply differentiated from each other, since they were of similar pattern. Various cities were bound to the city possessing the hegemony by separate treaties of alliance. Some of the treaties left the allies relatively free, while others placed them in hopeless subjection, although nominally autonomous except in foreign affairs. The Peloponnesian League, in which the hegemony was vested in Sparta, included subject allies as well as free allies who had entered the league of their own volition. The Latin League under the hegemony of the Roman city-state was of a comparable type. When Rome extended her hegemony over the whole of Italy south of the Apennines, the same league pattern based on separate treaties was retained. The Carthaginian Empire appears to have been similarly constituted. The Athenian Empire grew out of a free league of states, in which Athens gradually rose to greater and greater power until most of the allies were subject allies. When the Spartans for a brief period became dominant over the many

city-states of this Athenian Empire, the system was for the most part retained, although Spartan garrisons and supervisors (harmosts) were placed in many of the subject cities. A rather comparable imperial pattern in modern days is presented by the relation between England and the autonomous native states of India. These states are bound to England by treaties, but their kings must acknowledge the king of England as emperor or overlord. Consider also the American "empire" in which Cuba and other Latin American states are virtually subjected through treaty.

The king of kings type of empire gradually gave way in Mesopotamia to a new type, perfected at last under the Assyrian supremacy (c. 750 B.C.). Conquered areas were deprived of local autonomy and even of their old identity; the kings of the conquered states were removed; the conquered states were arbitrarily aggregated into provinces which were governed by provincial governors appointed by the conquering king or emperor as his personal representatives and removable at his will. A fundamentally similar pattern of administration of conquered peoples was evolved by Rome when her empire reached beyond Italy, and was adopted for the administration of the Chinese Empire upon the completion of conquest by the Ts'ing dynasty in 221 B.C.

In addition to displacing the local governments the Assyrians at times colonized groups of undoubted loyalty among the newly conquered and settled groups of the conquered among Assyrians and other loyal groups. The captivity of the Jews is a well known example. An exactly similar device of cross colonization was used by the conquering Incas of aboriginal Peru, by the conquering Iroquois of North America and by the conqueror Powhatan of old Virginia in North America.

Displacement of the upper ruling class of the conquered by the conquerors took place in the conquests of the ruling classes of the Pictish western highlands and islands of Scotland by the Dalriad Irish ("Scots"); of these Irish by the Norwegian vikings; of the Frankish rulers of present day Normandy in France by related groups of Norse; of England by these Normans; of the western provinces of the Roman Empire by various Teutonic groups; and of Peru and Mexico by the Spaniards.

The problem of the cause of conquest is primarily the problem of the motives of the conquerors. Generally a group is led to attempt conquest through a desire on the part of its rul-

ing class to increase its revenues and to satisfy a love for glory. The former is probably the more important and has no doubt often operated without the latter. Occasionally, no doubt, other motives have played some part. An offensive may often have been taken primarily because it was, paradoxically, the best defense. For example, trade routes already controlled might appear to be in danger and policy might require in a particular case a measure of aggression against the source of danger. The United States today is aggressive in defense of the Panama Canal and the Nicaraguan canal route, building its empire chiefly by the treaty or league method. Religious propaganda might enter into the motives of conquerors, as in the case of Charlemagne's conquest of the Saxons, the Spanish conquest of Latin America and the conquests of the Arabs. But religious propaganda is probably undertaken on a large scale from motives of self-glory, and in the story of the Spanish conquest of Latin America it appears to have been in fact secondary to a desire for revenues.

Although cultural forms or institutions have spread and do spread without conquest, conquest has the effect of accelerating the process of diffusion. For example, the Spanish conquests in the Americas unquestionably effected a great acceleration in the diffusion of Old World culture to the aboriginal Americans; and the Roman conquests in Europe likewise helped the spread of Mediterranean culture to the regions conquered and even beyond—to Ireland and Pictland.

This diffusion need not be evaluated as a diffusion of "superior" institutions. The success of conquerors historically has often been due to actual superiority in material culture, military technique and political organization. But it has often been due merely to events of good fortune which may be described as accidents. In any case, superiority in political and military technique or in material culture alone, as was evidenced in the relation of the Spaniards to the Incas and Aztecs, does not necessarily imply superiority in institutions. Material culture, military technique and political organization may be objectively compared, but evaluation of good and bad or inferiority and superiority in other institutions is generally merely a matter of subjective likes and dislikes. For example, the Latin speech spread by the Spanish conquerors in the Americas is not, objectively considered, superior to the Aztec language. The Moslem religion spread by the Arabs is not, objectively

considered, superior to the Christian religion, which it so widely displaced.

Frequently conquerors instead of spreading their own culture adopt the general culture of the conquered. Thus the Norse conquerors of what became Normandy gave up most of their own culture, including their language, for the Latin culture of France; and in what became France before the Normans the Teutonic Franks and Burgundians surrendered most of their own culture, including their language, to adopt that of the Romans. When the Latinized Normans conquered England they effected a permanent diffusion of much of Latin culture in England but gave up their Latin speech for that of the conquered. The Mongol and the Manchu conquerors of China are other examples.

The acceleration in the diffusion of culture effected by conquests is, however, incidental to the prime political effect of conquest and is of decidedly secondary importance in culture history. The principal effect of conquest is political—the consolidation of the territories and peoples of conqueror and conquered. Conquests have been the dominantly important cause of the development of political consolidation.

Consolidation may nevertheless be accompanied by a political disintegration. For example, while the conquests of the Teutonic peoples in the provinces of the western Roman Empire enlarged numerous small Teutonic states they brought at the same time disintegration of the great Roman Empire in the West, an incomparable disaster in European history. Conquests in eastern Europe and western Asia by Finnic and Turkish peoples effected a progressive contraction of the Roman Empire in the East.

The expansion of states, like the diffusion of culture, has often proceeded without the intervention of conquest. The modern German republic is an example of integration effected since the Napoleonic era primarily through a peaceable process, and the union of colonies which resulted in the United States was peaceably effected. But for the maintenance of the integrative process in the United States during the nineteenth century expansion it was necessary for the North to conquer the South in the Civil War, and most of the earlier work of German integration was the consequence of the Napoleonic conquests. Conquest has sometimes cost much and sometimes very little in bloodshed and devastation. On the whole its effect has been benign, widening the areas of peace. For example, after more than five hundred years of

constant war between independent Chinese states the conquering king of the state of Ts'in brought all China under his rule and established an empire in 221 B.C. which then governed some 50,000,000 people and some million square miles. For more than two thousand years this empire survived, widened its boundaries, expanded its population to 275,000,000, living in peace within its borders, and contributed as much to human culture as any comparable large section of the world up to the industrial revolution. The conquest by Spain of the aboriginal peoples of what is now Latin America initially cost something in life and happiness, but ended the innumerable wars of the native peoples for the most part and created a *pax romana* for the New World. When Spanish rule ended and the present Latin American states were established, the new imperialism of the United States with its Monroe Doctrine fortunately appeared to help keep peace. The conquest by England in the 1640's of the tribally organized Celts of Ireland and in 1745 that of highland Scotland were bitter affairs, but they too ended forever the constant bloodshed incident upon the separatism of the Celtic regions. The story of the ever widening area of empire in Mesopotamia and its adjacent territories is one of the expansion of peace. The English conquest of India ended sectional warfare among a people who now number about 350,000,000. However often great integrations have disintegrated, the tendency of political development has been toward the establishment of greater and greater states. Conquest has been an outstandingly important factor in this expansion, which has brought with it an expansion of the reign of peace and progress for peoples. This, therefore, is in large part the principal and ultimate effect of conquest.

Conquest has figured in social theory chiefly in the theory of social origins. Gumplovicz, building in part on ancient ideas, developed the theory that the state or political organization and social stratification of social classes originated together in early society by reason of the conquest of one group by another. Class struggles within historic groups he considered to be the consequence of the survival of the original hostility of conquered and conqueror. Ratzenhofer, Ward and Oppenheimer have been the most noteworthy adherents of the Gumploviczian theory, but only Oppenheimer has modified it to any extent, injecting into it his theory that private ownership of land also was a

consequence of the original conquests. The ancient theory of a social compact persisted into modern times as a rival to the conquest theory of origins. Other theories explaining origins without conquest have been propounded, notably by Novicow, Frazer, Perry and the present writer. An eclectic theory championed by Löwie suggests that, while the state and social classes may sometimes have originated without a conquest, in other regions or among other peoples conquest may have been the originating factor.

H., *The Origin of the State* (New York 1927).

CONRAD, JOHANNES (1839-1915), German economist and statistician. The son of a landed proprietor, he engaged at first in practical farming and later studied natural science at the universities of Berlin and Jena. Under the influence of Bruno Hildebrand he became seriously interested in economics, took his degree in the social sciences at Jena in 1864 and decided to pursue an academic career. In 1872 after four years of teaching at Jena he went as professor to Halle, where he remained for the rest of his life. After 1872 he assisted, and in 1878 succeeded, Hildebrand as editor of the *Jahrbucher für Nationalökonomie und Statistik*, frequently referred to as Conrad's *Jahrbucher*. He was one of the editors of the monumental *Handwörterbuch der Staatswissenschaften*, being particularly active in preparing the second and third editions. In both of these publications he attempted to attract as collaborators practical economists and administrators, including public officials.

Conrad was chiefly interested in problems of agrarian policy and agricultural statistics. His doctoral dissertation, a historical and statistical refutation of Liebig's thesis on the exhaustion of the soil, was followed by a study of German agricultural statistics and of the light they shed on crop yields and costs. Later he

published articles criticizing Rodbertus' proposals regarding agricultural credit and opposing the system of entail (*Fideikommiss*) as leading to the growth of latifundia. Above all Conrad was concerned with the subject of agricultural protection, an important public issue in Germany at the time. He was not an opponent of protection in principle and eventually even favored moderate grain duties, but he stressed the necessity and practicability of self-help on the part of farm and estate owners. His views strongly influenced the policy of Chancellor Caprivi and led to a reduction of agricultural duties in the commercial treaty with Austria in 1892. In addition to this major interest Conrad studied also current price statistics and the statistics of German universities.

Conrad was not given to abstract thinking in either economics or statistics. His writings, most of which appeared in the *Jahrbücher*, display a practical viewpoint uninfluenced by the dogma of any particular school. His greatest gift was perhaps his ability as a teacher. At his lectures as well as in his seminar he assembled and stimulated a large number of distinguished students, many of whom were foreigners, particularly Americans. The textbooks which grew out of his lectures were for two decades the most widely used manuals in Germany. His *Leitfaden zum Studium der Nationalökonomie* (Jena 1901, 6th ed. 1919) and some volumes of his *Grundriss zum Studium der politischen Ökonomie* (4 vols., Jena 1896-1910; 11th ed. of vol. i, 10th ed. of vol. ii, 9th ed. of vol. iii, and 4th ed. of vol. iv, Jena 1923-25) passed through many editions during his lifetime; revisions of both were edited after Conrad's death by A. Hesse.

CONRAT (COHN), MAX (1848-1911), German jurist. Conrat spent the greater part of his life as professor at Amsterdam. With his *Das Florentiner Rechtsbuch* (Berlin 1882) he entered upon the field of early mediaeval law, to which he devoted the remainder of his life. With this work he also began his opposition to the so-called continuity theory of a science of post-classical Roman law, then in the ascendancy under the influence of Fitting. His view at first

attracted little attention. Reasserted with elaborate proofs in the introduction to his succeeding work, an edition of the *Epitome exactis regibus* (Berlin 1884), a massive piece of research, it was overthrown with respect to this particular document by one remark of Fitting's to the effect that it contained some material from Jacobus, the pupil of Irnerius. Nowise daunted, in 1889 Conrat published in two parts the first volume of his *Geschichte der Quellen und Literatur des römischen Rechts im früheren Mittelalter* (Leipzig), his greatest work. It is a mine of information, seven times the scope of the corresponding portion of Savigny's *Geschichte des römischen Rechts*, but due to paucity of references and conciseness of style it is somewhat difficult to use. Preparatory to a second volume Conrat entered upon the scientific editing of post-classical sources, a labor that aside from excursions into mediaeval ecclesiastical law occupied the remainder of his life. Twelve years intervened before the first of these editions, the *Breviarium alaricianum* (Leipzig 1903), appeared, a delay due in part to the unnecessary translation of this code into German. Realizing his mistake Conrat published the *Lex romana canonice compta* (Amsterdam 1904) in the original. Editions of the West Gothic *Die Entstehung des westgotischen Gaius* (Amsterdam 1905) and *Der westgotische Paulus* (Amsterdam 1907), which are editions of the West Gothic Gaius and Paul, were his last major works in early mediaeval Roman law. At his death he was preparing a new edition of the first volume of his *Geschichte* and working upon chapters of the second, fragments of which were published by H. U. Kantorowicz in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, romanistische Abteilung* (vol. xxxiv, 1913, p. 13-45). Conrat's stupendous activity in an almost untouched field was practically disregarded by his contemporaries, perhaps in part due to the fact that in all his works he failed to acknowledge the research efforts of others. The materials and their interpretation were all that interested him, not the personalities engaging in the research. Since his death, however, the source materials he collected and the theories he expounded have received considerable attention. As Kantorowicz has said, future scholars in this difficult but fascinating period of early mediaeval law "must build upon Conrat's foundations, with Conrat's materials and according to Conrat's methods."

CONRING, HERMANN (1606-81), German scholar. He was of astonishing versatility, and at the University of Helmstedt he taught medicine as well as philosophy and political science. In medicine he is known for the part he took in propagating Harvey's discovery of the circulation of the blood. His broad interest in moral and political science, based upon the Aristotelian ideal, led him to epoch making results in jurisprudence, political science, history and economics. In jurisprudence he was the founder of the history of German law in his *De origine juris germanici liber unus* (Helmstedt 1643), in which he exploded the myth that the Roman law had been introduced into Germany in 1135 by a constitution of Lothar III. He showed not only that the reception had not taken place until the fifteenth century but also that it had not prevented Germany from developing a common law adapted to national needs. He also opposed the theory of natural law then coming into favor. With his *Examen rerum politicarum potiorum totius orbis* (1662) he founded the German "university statistics," the old descriptive political science which preceded the more numerical "political arithmetic" of Graunt and Petty. Indeed, he had begun in 1660 in a lecture, *Notitia rerum publicarum*, to describe a large number of states according to the four Aristotelian categories of *causa finalis* (state purposes), *materialis* (population and national economy), *formalis* (state forms), *efficiens* (state government). Conring's work thus shows that Achenwall can only qualifiedly be called the "father of statistics." As a political economist he was rather averse to mercantilism. He gave particularly close attention to public finance as in his *De aerario* (Helmstedt 1663), *De vectigalibus* (Helmstedt 1663) and *De contributionibus* (Helmstedt 1669). His skill in method is revealed particularly in his treatment of the problem of population. He put questions which only later statistical investigation has been able to answer. It was no exaggeration, considering the manifold character of Conring's work, that Meibom should have called him *saeculi miraculum*.

CONSALVI, ERCOLE (1757-1824), Italian cardinal and statesman. Consalvi first became prominent in the church during the crisis which followed the French invasion of Italy and the captivity and death of Pius VI. As secretary of the conclave which met in Venice in 1799 he secured the election of Pius VII, by whom he was then named cardinal and secretary of state. Consalvi immediately began to manifest those preeminent abilities as statesman and diplomat which were to guide the church safely through the pontificate of Pius VII (1800-23), one of the most critical periods in its history. It was he who ultimately negotiated the Concordat of 1801 with France, who induced Napoleon to recognize Roman Catholicism as the "religion of the majority" and to consent to the deposition of the constitutional clergy. The antagonism between Napoleon and Consalvi which was aroused by these negotiations increased during the following years and reached its climax in 1808 when Napoleon abolished the pontifical government and forced Consalvi to retire completely from political life. He emerged in 1814 to meet the allied sovereigns at London and later to represent the papal government at Vienna. Through his amazing diplomatic skill Consalvi was able to obtain the restoration of the Marches and the Legations to the papacy. But having failed to keep Austria from the left bank of the Po or to secure the restoration of the Holy Roman Empire he delivered at the close of the conference his famous *Protestatio* against the powers. After Vienna he continued his policy of combating foreign interference. Using his personal charm and tact to keep the powers conciliated he refused to take part in the system of intervention, and both at Verona and Troppau vigorously protested against it. During these years Consalvi

turned once more to the reorganization of the papal government which he had first attempted on a grand scale in 1800. He furthered the centralization initiated during the French occupation, struggled with the chaos of papal finances and tried to introduce order into judicial procedure. He met with only partial success and when he retired in 1823 the great economic and social problems of the papal government continued to harass more liberal reformers. Consalvi's *Memoirs* have been published (2 vols., Paris 1864, 2nd ed. 1866) as well as several volumes of his correspondence.

CONSCIENTIOUS OBJECTORS. A conscientious objector is one who passively resists the effort of some social group, usually the state, to compel him to do something against which he holds conscientious scruples. The behavior of the conscientious objector is purely defensive and non-aggressive and is often, although not necessarily, a result of pacifistic views.

During its first three centuries of existence the Christian church was opposed to war and other forms of violence. Christian opposition to war early expanded into a denial of the rightness of all coercive action on the part of the civil power. Thus arose that form of conscientious objection which has been designated as political non-participation. Sects such as the Amish Mennonites, who are typical political non-participants, refuse to vote or hold office under any government. The church herself later became identified with the state, with the result that conscientious objection to governmental coercion has been transmitted to the modern world by a line of obscure peace sects. The Albigenses, Waldenses, Bohemian Brethren and Moravians carried on the early Christian tradition of non-violence from the Edict of Constantine to the Reformation. Outstanding among the post-Reformation groups are the Mennonites, Dunkers, Schwenkfelders, Shakers, Quakers, Molokans and Dukhobors. These groups, together with a few more recent religious movements such as the

Christadelphians and International Bible Students, constitute most conscientious objectors of the religious type in modern times. Of the non-religious type the conscientious objection of the high school youths of Australia and New Zealand to cadet training before the World War is an outstanding example.

The World War brought into prominence various types of objectors. In addition to the religious objector opposed to war in general there was the socialist objector who was opposed to the war on international and humanitarian grounds, and especially because it was held to be the work of capitalistic interests arraying the masses against one another. Some socialist objectors, however, expressed their willingness to participate in a war of the proletariat against capital. A third type, the individualist objectors, often called "absolutists," denied the right of government to force the citizen to fight or do anything else contrary to his own conscience. Their objection was directed at conscription in and of itself, regardless of the righteousness of the particular war or of war in general. It is this third group of objectors on whom considerable attention was centered during the war. Many objectors accepted non-combatant service without compromising their conscience, but not so the individualist objector. In Germany those refusing non-combatant service were commonly declared insane. In France, where there was no legal recognition of objectors, they were put to death as deserters. In both Great Britain and the United States, where conscription systems were put into effect, certain exemptions were allowed but did not include the individualist objector. In Great Britain, whose first compulsory military service act was passed in January, 1916, provision was made for exemptions "on the ground of a conscientious objection to the undertaking of combatant service." Of approximately 16,000 conscientious objectors it is estimated that some 1350 refused to perform any service ancillary to the military and in consequence served repeated imprisonments at hard labor for the same offense.

In the United States the Selective Draft Act of May 18, 1917, explicitly granted the right of exemption to any person "found to be a member of any well recognized religious sect or organization at present organized and existing, and whose existing creed or principles forbid its members to participate in war in any form, and whose religious convictions are against war or participation therein, in accordance with the

creed or principles of said religious organization." Thus there was no provision for the individualist objector, exemption being limited to the religious objectors, who, furthermore, were liable to such non-combatant services as the president might specify. Nevertheless, the peace sectarians, who were sent to army camps as a necessary consequence of Draft Board routine, were frequently later sent to prisons along with the non-religious objectors.

The very act of sending the objectors to army camps made it impossible for the government to deal with them except by assuming that they were soldiers in the military forces, which was the very thing the so-called "absolutists" declared themselves morally unable to be. The government persisted until the end of the war and afterward in its endeavor to break the will of the objectors, and general amnesty was never declared as it was in most of the countries of Europe. Many of the religious objectors accepted non-combatant service of one kind or another, and 1200 were furloughed to agriculture. The Friends (Quakers) of Great Britain organized reconstruction work in the war devastated areas of France; American Friends later joined the movement, and ninety-nine American religious objectors were furloughed to the Friends Reconstruction Unit in France. Finally, out of the original 3989 persons who claimed exemption in the United States only 450 "absolutists" were left and they formed the bulk of those sent to prison by court martial. They were sent along with soldiers of criminal type; they were measured and tested by psychiatrists upon the legal fiction that they were criminal delinquents, whereas many of them were simple minded, sincere and harmless. This situation was the result of the government's will breaking policy and its dependence upon psychological and psychiatric specialists for handling a problem that was essentially one of sectarian group life and culture patterns and understandable only by the methods of historical, anthropological and social science.

Testimony is not wanting to show that the absolutist conscientious objectors found their bitterest opponents in religious leaders of almost every kind. The Federal Council of Churches of Christ in America, the separate denominational establishments and the Y. M. C. A. all neglected to bespeak mercy for the conscientious objectors, much less to defend them, while they suffered under excessive prison sentences. This attitude of organized religion reflects the almost univer-

sal hostility of the public toward conscientious objectors. Even the policy of the administration and the army was far less bitter than that of the popular newspapers and their readers, whose severe criticism of the government's alleged leniency hampered its efforts and condemned its results. This popular hostility was followed after the war by widespread admiration for the reconstruction work done by religious objectors and by an extraordinary revulsion against war on the part of the great Christian denominations.

The conscientious objector has always stood as a most difficult challenger of the political state's claim to absolute authority over its citizens. Conscientious objection is itself simply a special case under nonconformity, and heresy is another aspect of the same thing. The list of conscientious objectors therefore includes most of the intellectual and moral innovators in human history. The future role of conscientious objection is momentous and problematical. As a solution to the conflict between the state and the allegiance of the individual Laski suggests a future state in which the rights of the minority and the judgments of conscience will be respected and wherein the state will receive the individual's allegiance "only where it commands his conscience."

CONSCIOUSNESS. No concept has played a more important role in the growth of the philosophical sciences than that of consciousness. In fact the characteristic of modern philosophy is the clear recognition of the problems that may be called problems of consciousness. With the famous proposition *cogito ergo sum* consciousness was heralded into the arena of philosophical argument, where it has since remained one of the central figures. While the principal interest of the social sciences lies in special applications of this concept in the field of social psychology, a clear definition of the broader concept is essential. A very general definition such as that in the *Encyclopaedia Britannica*, "consciousness in its widest sense denotes mental experience of every kind," does not go far, however, since it transfers the inquiry to the meaning of the words mental and experience. To give a definition of consciousness that is not merely verbal is impossible unless it is the result of a complete system of metaphysics.

The concept of consciousness is historically rooted in certain philosophical problems. The manifold objects and events that make up our total experience fall into two classes: those that are objects in the proper sense of the word, i.e. things and events which are not part of me but surround me, attract me, satisfy me and so forth; and those events which are events of myself. There is a house, a lake, a wild beast; but here am I, glad to be back at home, struck by the beauty of the lake, afraid of the dangerous animal. This classification, which distinguishes between physical and mental objects, is as a rule fairly clear cut and pervades all experience. Out of it, because of the intimate relation between mind and consciousness, arises a preliminary definition of consciousness as the sum of all mental objects in the sense of events that belong to me, my feelings, thoughts and wishes. This definition, by which mental phenomena are defined with reference to a specific characteristic that distinguishes them from the physical phenomena, while it has remained unformulated for a long time, is the oldest; it has been revived in a highly elaborated form by Franz Brentano.

Another root of the concept is grounded in a different set of facts. In observing behavior we are struck by the difference between acts of which we are aware and those which we do unwittingly—in sleep, in a swoon or during a narcosis. We call these latter acts unconscious

as opposed to our ordinary conscious acts and then discover that even in our normal waking life we do a great many things unconsciously. In this latter sense consciousness becomes synonymous with awareness, and this concept further developed with regard to the object of this awareness assumes the more specialized form of "the mind's awareness of its own processes." Apart from other difficulties this definition takes the processes of the mind for granted, whereas according to the first definition the mental processes are what we call consciousness. Nevertheless, this definition has had far reaching consequences. Since it arises from the opposition not of the mental and the physical but of conscious and unconscious acts, it introduces the concept of the unconscious; and since the distinction between the conscious and the unconscious appears to be not absolute but of degrees, new concepts have bridged the gap that separates the fully conscious from the totally unconscious, viz. the subconscious and the co-conscious.

Another concept of consciousness is related, in its simplest form, to the fact that the world as we perceive it depends not only upon the world as it is but also on the observer. The blind man cannot see, he does not even know what color is; we can double the number of things seen by pressing on one of our eyeballs or by becoming intoxicated. These observations, while they were probably made at a remote time, need not inevitably lead to a concept of consciousness; primitive people believe that what the medicine man sees in a state of trance or intoxication is even more real than what the normal members of the tribe can perceive. Greek philosophy, however, did develop the subjectivity of the sense qualities; this was clear in the minds of Democritus and Plato. Since Locke it has become a central fact in philosophy. But once our perception had lost its character of complete objectivity and become at least in part a matter of consciousness, it was a natural transition to see perception in its totality as conscious. Berkeley drew this consequence: *esse est percipi*; everything is consciousness, the house yonder no less than my joy of coming home. Thus the distinction between the physical and the mental on which the first notion of consciousness rested is invalidated, with the effect that within experience everything is conscious. But by becoming all inclusive the concept of consciousness has lost all significance. No problem is any longer solved by assigning

a certain part to consciousness, since all fact-belong there; whereas the whole trend of thought with which we are concerned at the moment originally arose in order to clear up difficulties, to remove conflict within our experience. To avoid making it thus a meaningless concept a change in the point of view was necessary. Mind (and consciousness as part of mind) and matter had been considered as different entities; now they are considered only as different points of view. We speak of matter and are engaged in physics if we look at experience as independent of any particular person; conversely, we are dealing with mind or consciousness when we regard experience as depending upon the experiencing person. This view was developed by Mach and Avenarius; it was the foundation on which Wundt's and Titchener's psychological systems rested.

In the course of the development of the concept of consciousness certain ideas accrued to it that have been of doubtful benefit. The subjectivity of perceptual or sense experience meant at first no more than that experience depends not only upon the world but also upon the experiencer; this functional point of view was exchanged for a descriptive one according to which all experiences, sense experience no less than our emotions and wishes, were considered as special states of ourselves. New problems were thus raised which were in reality devoid of meaning. How comes it, so would the question run, that such purely qualitative experience of myself is referred to something else, projected into an external world? In psychology textbooks this appears under the question of how sensation is transformed into perception. It has been lucidly discussed as a fallacy by Avenarius, who calls it introjection.

But even more harmful than this erroneous interpretation of subjectivity is the doctrine of the compositeness of consciousness. The modern doctrine derives originally from Locke's distinction of simple and complex ideas. It was taken over by Wundt, who maintained that all our experiences, both sensory and effective, are composed of elements; hence to be a compound of elements is a characteristic of consciousness. This view has left its stamp on the development of modern psychology. In America its chief representative was Titchener, who had studied with Wundt at Leipsic. It has been emphatically and skillfully attacked by William James, notably in his famous chapter on the mind-stuff theory (*Principles of Psychology*, vol. i, ch. vi)

But James' positive theory of the continuity of consciousness overshoots the mark. Clearly as he saw the artificiality of the dissection of consciousness into mental elements he failed to give a proper place in his system to the actual articulation of our experience. Although at the present time there are but few psychologists who would explicitly defend the theory of the compositeness of experience, it still exercises a powerful influence. It has even penetrated into behaviorism in the form of the theory that behavior is a compound of behavior elements, the reflexes. It has also found a surprising application in the new realism, as appears, for example, in Holt's statement that "nearly if not quite all of the so-called secondary qualities are, taken merely as phenomena, complex" (*The New Realism*, p. 337).

The concept of consciousness involves a dualism between the object as it appears by itself and as it appears in consciousness, an epistemological dualism which ought to be distinguished from the metaphysical one of mind and matter. That epistemological dualism may in the development of the concept give way to a monism like that in Berkeley's philosophy. In modern times this tendency has culminated in the positivistic philosophies of Mach and Avenarius, which attempt to reconcile the monistic philosophy of Berkeley with the distinction between conscious (or mental) and non-conscious (or physical) events. This is achieved, as has been seen, by abolishing the opposition between the ego and the world, experience and reality, thereby retaining a monistic system, and by making the distinction between the mental and the physical a distinction of method. A related theory of epistemological monism has been developed by the new realism; it is one of its main propositions "that the content of knowledge, that which lies in or before the mind when knowledge takes place, is numerically identical with the thing known" (*The New Realism*, p. 34).

The most powerful monistic movement of the present time, however, is behaviorism. Behaviorism attempts to defeat dualism by expelling consciousness from science, if not from existence. The behaviorists were led to this extreme position by several trends in psychology which had made themselves felt about 1910. On the one hand, they recognized clearly that the use which was made of consciousness by contemporary psychology had made this study a barren field. Both the subjectivistic and the

compositive aspect of consciousness had produced investigations whose results were neither interesting scientifically nor properly proved. On the other hand, animal psychology was beginning its vigorous life, and in this branch the allegedly fundamental method of psychology, introspection, was inapplicable. Since animal psychology proceeded without introspection, the behaviorists reasoned, it should also eliminate all references to concepts intrinsically related to introspection and should describe the behavior of animals in no wise differently from the behavior, say, of magnets. But if this is possible the same should be possible for human behavior, since there is no break in the animal kingdom that separates man from the rest. A last step would be to deny that consciousness has any meaning at all, to admit that everything in observable behavior is reducible to stimuli and responses. The fallacies of this "philosophy" (for a critical summary, see Roback, *Behaviorism and Psychology*) have been most clearly demonstrated by Russell and Köhler. When the physicist takes a reading on a galvanometer, when the behaviorist observes a rat running a maze, both are dealing with and relying on events which are their experiences, not unexperienceable physical objects. A leader in the behavioristic movement, W. S. Hunter, in answering the arguments of Russell and Köhler asserts that the behaviorist does not deny the existence of the world which his opponent will call consciousness (or the world of direct experience); "what the behaviorist does deny is that any of the objects or events in the world have been shown to be mental or psychic" (*Psychologies of 1930*). First, however, among the hypotheses advanced by the behaviorists to explain the probable nature of this environment, according to the same author, is the hypothesis that it consists of proton-electron aggregations. To this it must be objected that the environment of proton-electron aggregations and the environment of houses and books and chairs and tables, of trees and rivers and mountains, belong to entirely different universes. The behaviorist slips from the one to the other with ease and cannot understand the psychologist who feels the bump at the transition. Behaviorism might have given a better balance to psychology by insisting that behavior, even highly important behavior, is not synonymous with conscious behavior. Instead, owing to an extreme mechanistic bias, it blinded itself to the significant aspects of be-

havior and left psychology as unbalanced as it was before.

The concept of consciousness as derived from the functional subjectivity of perception requires a last elaboration. The older arguments were concerned mainly with the subjectivity of the sense qualities: blue and green, warm and cold, etc. The same argument can be used on a much higher level; for example, the world in which we live is different from the world of primitive man. John Dewey, whose contribution to the subject of consciousness can by no means be adequately treated, has admirably described some instances of this transformation. The ocean looks flat, and yet the first we see of an approaching ship is the mast's head. Once the two facts become connected, they can no longer remain side by side without some alteration in their intrinsic meaning. Both must remain facts, and they can do this only if assigned to different universes; the flatness becoming an appearance, a fact of direct experience, whereas the coming into view of the masthead reveals a character of the real earth, its roundness. By this argument, consistently and universally applied, everything I know directly becomes part of one world, the world of my direct experience, and behind this world of direct experience another world has to be constructed in order to give meaning to the former. The world of direct experience is but another name for consciousness in one of its meanings, a word which excludes the ambiguities of the older term. The importance of this world of direct experience in its actual mode of existence has been brought to the fore in recent philosophy and psychology. This world is not a compound of patches of colors, noises, smells and so forth but is our world of inanimate and animate things, of our fellow creatures as we know them, of all the happenings which make up our experience and, last but not least, of ourselves with our hopes and fears, wishes and repulsions, joys and sorrows. The ego, which should never have disappeared from psychology, is thus reestablished. If the direct experience is recognized as what it is, we have to admit that a meadow may be fresh, a mountain terrifying, a dark cloud ominous and the face of a successful bully ugly before we begin to search for a theory of these facts. The upward urge of a Gothic cathedral is a property of the cathedral and not of my ego, much as it may provoke in the ego a similar urge. All theories of empathy (*Einfühlung*), to the extent

that they maintain the contrary, are untenable, as demonstrated by Dewey, Köhler and the phenomenological school. Lastly, this same world of direct experience contains, without inferences, a great many characters which philosophers would call relational. In my naïve direct experience I see one billiard ball push the other, even if in a Humean frame of mind I may succeed in transforming this perception into one of mere temporal sequence; so also I feel myself pushing the first ball with my cue. I feel myself insulted by the behavior of somebody, but I do not experience an emotion of anger concomitantly with the perception of somebody's behavior. I hurry to the concert hall because I do not want to miss the beginning of a certain piece; it would be a falsified description to say that associations, i.e. an unexperienced force of habit, produced an acceleration of the coordinated movements of my legs.

The earliest solution of the mind-matter problem was dualistic, an interaction between body and mind. This solution is characteristic of Greek philosophy, in which the mind is chiefly the moving principle of the body, soul and life being almost identical. In modern times interactionism has found able defenders in Stumpf, McDougall and Driesch. Interactionism is to some extent an attempt to combat epiphenomenalism, the view that consciousness is a mere luxury, a glow of some sort that accompanies some mechanical processes without exerting any influence on them. But interactionism has had few followers in modern psychology; it tends to bring investigation to a standstill at the very point where it may become most interesting.

The view most widely held by active psychologists has been parallelistic, either in the more metaphysical form of Fechner, by which mind and body are considered two aspects of one identical essence, or as a heuristic principle, according to which each conscious experience has a physiological correlate. Mach in 1863 and 1865 was probably the first to make a well considered use of the heuristic principle of parallelism, according to which there correspond physical details to all mental details. In 1896 G. E. Müller laid down a number of psychophysical axioms, according to which principles of classification of our experience, e.g. our sensations, must have their counterpart in principles governing the underlying physiological processes. These axioms establish a sort of isomorphism (Köhler) between conscious and

cerebral events. Parallelism, however, presented also a heteromorphic aspect; since we can neither predict from a mere inspection of blueness what kind of cerebral process will correspond to this experience, nor could we recognize a cerebral process as corresponding to the experience of blue even if it were possible to observe such a process, the general statement was made by Wundt that physical and mental phenomena, although in regular correlation, are radically incomparable with each other. There is a flat contradiction between this view and the isomorphistic view which holds that if similar experienced qualities find as their correlates similar cerebral processes, then at least as far as the similarity relations go consciousness and the cerebral processes are comparable. Since isomorphism is alone fruitful as a doctrine of parallelism, enabling us to build physiological hypotheses for our sense experience, there was value in retaining and enlarging it.

This enlargement was one of the great deeds of Gestalt psychology. Wertheimer has propounded the idea, which was not alien to Fechner's mind, that isomorphism refers not only to the abstract principles of order and classification but to the concrete dynamic aspects of the events themselves, an idea which has been elaborated by Kohler. Where I experience a movement, the underlying physiological processes will also have the character of a movement; when I see a symmetrical, clear and self-contained form, the underlying process will also be symmetrical, well segregated from the rest of the field and relatively self-subsistent. This principle, consistently pursued, has an enormous scope and practically unlimited heuristic value, as Köhler has demonstrated in his *Gestalt Psychology*. It is bound up with very definite views as to the nature of conscious and physical events; it could never have grown out of psychological atomism nor out of James' doctrine of continuity. What is claimed to be similar or even identical on the two parallel sides is not quality at any one point but the form of organization of the whole field. Since Gestalt theory was a theory of organization it had to establish the reality of organized wholes, *Gestalten*, in both the mental and the physical realm.

The principle of isomorphism has a very direct bearing on the general mind-matter problem. Traditional theory makes the connection between a mental event and a physiological one a purely factual contingent connection which, in contradiction to the use made of

parallelism, would have to be discovered in each separate case. Isomorphism leads necessarily to a different conclusion: the connection far from being fortuitous is intrinsic and essential. Gestalt theory is dualistic with regard to the epistemological problem of consciousness, but with regard to the metaphysical problem of mind and matter it may very well be monistic. First, it sees no reason to apply the concept of substance to either mind or matter; it seems more important to ask how a certain constellation, mental or material, behaves than to ask of what it is made. Secondly, isomorphism points to Kohler's conception that in a way the conscious side expresses the physical (cerebral) process or, to put it in the words of Dewey, who reached his conclusion from a different starting point, "that consciousness is not a separate realm of being, but is the manifest quality of existence when nature is most free and most active" (*Experience and Nature*, p. 393). Bertrand Russell in his neutral monism seems to incline toward similar views.

The question of the extent to which consciousness can be ascribed to animals cannot be decided with certainty by any existing criterion. In this respect the contention of behaviorism is correct. Memory, which has frequently been used as such a criterion, is primarily a fact of behavior and does not necessarily imply consciousness. We could let the matter rest with this statement were it not that the issue has raised a great deal of controversy, largely because of its connection with the mind-matter dualism. Matter was considered the inferior essence, obedient to blind mechanical laws, the counterpart of sense, order, value. Mind, on the other hand, was of divine origin, the creator of all the qualities barred from matter. Therefore the natural philosophers who found order, meaning and purpose in animal behavior were strongly in favor of ascribing to them the possession of consciousness, whereas the anti-sentimentalists, the hard boiled empiricists, reveled in their achievement of having reduced behavior to a blind interaction of mechanical principles once they had refuted all alleged claims for the existence of consciousness. In reality, then, the controversy turned on the type of behavior rather than on the presence or absence of consciousness. A conscious being, if he was entirely subject to the laws of sensation and association, would manifest purely mechanical blind behavior; whereas we might very well conceive of another being that without

awareness acted sensibly. This, then, is the real issue; and all modern animal experimentation, far from clarifying to the slightest degree the problem of whether animals have consciousness, has demonstrated an enormous wealth of behavior forms varying from perfect insight to almost blind trial and error. No experiment on animals can answer the question, "Is the animal conscious?" but each good experiment can give us information about the kind of consciousness the animal would have if it were conscious.

As we have seen, there has been a tendency in philosophy to use mind and consciousness more or less synonymously. Against this usage many objections may be raised. One special attack upon this restriction of mind has been connected with the concept of the unconscious and the allied, more modern concepts of the subconscious and co-conscious (Morton Prince), which have found their most systematic elaboration in psychoanalysis and related schools. A logical and very astute analysis of the various meanings of these concepts is given by Broad in his *Mind and Its Place in Nature*. The unconscious is not synonymous with the non-conscious. In fact, as a concept it bears a very close relation to the concept of the conscious as awareness. This is also true of the concepts of the sub- and the co-conscious. The reason for the introduction of the unconscious as a systematic concept is made clear by Flügel in his concise presentation of the status and the prospects of psychoanalysis (in the volume *Psychologies of 1930*). It is the attempt to establish a consistent and closed psychological theory of behavior, "a thorough psychological determinism, according to which every psychological event is regarded as having a psychological cause." Clearly, consciousness is not sufficient to satisfy this postulate. It is impossible to determine the consciousness at one moment by the consciousness of the preceding moment, even if we exclude (and this exclusion must be implied in Flügel's statement) the facts of perception. This insufficiency appears in two ways; on the one hand, there is the need of explaining the facts of memory, beginning with simple recognition; on the other, those of consistent purposive behavior. The unconscious idea would be the means to explain the former; the unconscious wish, urge, attitude, an explanation of the latter. Setting aside for the moment the unconscious idea, there is a clear advantage in the concept of the unconscious wish as against

other explanations such as the conditioned reflex; it establishes an intelligible connection between cause and effect, thereby making the determinism, which is blind and mechanical in the reflex theory, rational and meaningful.

Before proceeding to a discussion of the unconscious idea we must introduce a fundamental distinction, the neglect of which has caused much confusion, namely, the distinction between an actual process and the conditions under which it occurs. Every conscious experience is a process, an event which happens at a certain time, and in order that it may come to pass certain conditions must be fulfilled; e.g. in order that I see a tree a certain distribution of light, shade and color must be produced on my retinas and my brain must be more or less intact. Similarly, when I remember an event of my past life, this is a process and it depends upon a number of conditions, one of which is that the original event has changed me, i.e. my organism, in such a way that the present process, the recall of the original event, becomes possible. But the process of recall in no way indicates the previous existence of an unconscious idea of this past event, for this unconscious idea would be a process as much as the conscious idea, and there is no indication that every process which has once occurred in a conscious form goes on indefinitely in the unconscious. The concept of unconscious ideas to explain memory has therefore been abandoned. Nor does it play the chief role in psychoanalytic psychology. The psychoanalytic concept of the unconscious assumes its real importance in this connection when we consider that a process is produced by forces, which therefore belong among its conditions. The process of recall is the result of an attitude of the ego, and this attitude may itself be quite unknown to us. Indeed, experimental psychology has already elaborated methods to produce such attitudes in a subject totally ignorant of their existence and thereby to influence both recall and recognition. Are these attitudes unconscious? The use of this terminology should be avoided, for it seems to give a false point of reference. The characteristic of an unconscious attitude or wish is not its similarity to a conscious attitude or wish; instead, it is the state of stress and strain, and here the question of whether or not it is conscious is almost irrelevant. Both psychoanalysis and experimental psychology (see for example the school of K. Lewin) are agreed that the degree of conscious

intensity is by no means a reliable criterion for the strength of the real wish or need. The plausible deduction from this is not the distinction of conscious and unconscious wishes but the conception of stresses of different intensities at different levels of our personality. To summarize: psychoanalysis and kindred schools have been right in emphasizing the role of such effective factors as wishes, attitudes and needs as opposed to mere mechanical couplings like associations or conditioned reflexes; only the former afford an intelligible explanation of behavior. But they have been misled into calling these effective factors unconscious: on the one hand, by their failure to distinguish between processes and their conditions; on the other, by inadvertently falling into the dualism of the rational mind and mechanical nature. As has been indicated previously, there is a way of conquering this dualism, and the concept of the unconscious becomes unnecessary as a systematic concept although it may have an advantage as a convenient term.

Among the objects that make up our conscious environment there is one outstanding group, the one composed of our fellow creatures. They and with them a part of that group of objects we call animals have a characteristic which at first sight seems to distinguish them radically from all other objects—we ascribe to them a mind. And not only do we do this in a general sort of way but we endow that mind with particular properties: we find ourselves surrounded by gay and sad, vindictive and kind hearted, haughty and affable persons. How does this knowledge of the other man's mind come about and what does it mean? Traditional theory in both psychology and philosophy based it entirely on two principles: the principle of analogy, which asserts that since I know how I feel when I behave in a certain way, therefore when I see someone else behave thus I infer how he feels; and the principle of association, which makes the transition from the perception of the other person's movements to the reproduction of ideas or emotions less rational, the mere work of previously formed associations. Both these theories, although still widely held, have been proved false. C. D. Broad, in *Mind and Its Place in Nature* (p. 324 *et seq.*), constructs a consistent argument and concludes: "Hence only two alternatives seem to be left. Either (1) there are certain cognitive situations which actually contain other minds or certain of their states as objective constitu-

ents; or (2) the visual appearance of certain bodily forms, movements, gestures, and modifications, has for us an *unacquired* meaning." The first alternative was defended by the German philosopher and sociologist Max Scheler, and Broad himself is disinclined to reject it entirely. But since it clearly implies a monistic solution of the epistemological problem and since it must base its evidence on telepathy and similar phenomena, it seems unacceptable. The second alternative assumes in the hands of Dr. Broad the following form: "We must suppose that the innate constitution of human beings . . . is such that, when one sees any body which *in fact* resembles his own closely enough, he instinctively believes it to be animated by a mind like his own." This statement is hardly correct as a description and it is certainly unsatisfactory as an explanation. The word instinctive must bear the whole burden of the argument, and this passport has long ago given way under too great a strain.

Nevertheless, the solution must lie in this latter alternative, differently interpreted. In the discussion above of consciousness as the world of direct experience it was emphasized that direct experience shows us objects endowed with such characters as we are now discussing—the terrifying mountain, the ominous cloud. The form that an explanation of these facts must take is very briefly somewhat as follows. A person experiences a shock, i.e. his train of experiences is very suddenly and intensely disturbed; the result will often be a similar sudden and intense break in his outward behavior. To the onlooker this outward behavior, before the shock occurred, would have presented an even, continuous flow. The break in the behavior, which was the outward manifestation of the shock experience, will therefore, as a sudden change in the stimulating processes, produce a similar break in the onlooker's experience of the person's behavior; i.e. the person will, to the onlooker, appear to have suffered a shock. Köhler has elaborated this theory. It is a theory of direct perception of the other man's shock, anger, joy, which goes far beyond reducing it to an instinctive faculty, explaining it on the same principles on which it explains the perception of a square or a circle. And this theory accounts for the facts, the understanding of these expressive characters by infants and animals, but does not explain more than the facts. For, if we examine ourselves critically, do we really think of how someone else feels when we

see him gay or sad? In other words are we really concerned with his consciousness as long as we remain naïve onlookers or players of the game and do not become sophisticated philosophers? The answer will be in the negative, and that the more so as being gay or sad does not exhaust itself in certain experiences, not even in the bearer of these emotions. The terrifying cloud, then, is primarily terrifying in the same sense as the roaring lion or the offended "boss." What is called animism seems to strengthen such a view. That this theory is perfectly compatible with deception as practised by the actor or the hypocrite is obvious. When either of them succeeds in producing certain movements characteristic of an emotion without feeling the emotion, the onlooker must nevertheless, according to the hypothesis, see him possessed by the emotion.

In what sense and to what extent can the concept of consciousness be applied to social phenomena? This discussion will not be concerned with purely metaphysical constructions, which would postulate a group mind as something apart from and superior to the individual minds. Consciousness occurs somewhere, and the locus is always an individual. Nevertheless, the concept of social consciousness, and if properly used even that of social unconsciousness, is of great significance. Each individual finds himself surrounded by fellow beings; expressed differently, each "I" knows many "yous." But what specific influence does the existence of these yous in the direct experience of each ego exert on this experience? To say that experience is organized is so general a statement that it will hardly meet with opposition, although the cause of that organization is controversial. One principle of this organization is likeness. Like parts of our total field of experience tend to fall into the same group. Thus even from this most superficial of all principles of organization, we would expect that for each ego the yous will tend to form a group. And in one further step, the difficulties of which cannot be discussed here, the ego is drawn into this group. In reality very much stronger forces than the one just mentioned will also be at work; but the result will be that the field of direct experience will have as one of its outstanding parts a group which includes the ego. In other words the "we" may be just as primary as the I, the latter being originally but a part of the former. Here then is a group consciousness par excellence. And what is more, the group con-

sciousness will be effective in the activity of all the egos who have it. It is easiest to see this with a small group; each of its members will feel as a part of this we and whenever the existence of this we is threatened will react in a certain way; he will, for example, attack a newcomer. Thus concerted group action becomes explicable. But such an explanation if carried no further would be quite misleading; it would reduce truly concerted action to a number of individual actions issuing from a social consciousness. In reality, when the group is together, each action of one member changes the momentary status of the whole group and therefore determines what every other member must do. Through such a mutual interdependence truly concerted group activity appears. It is clear that the stronger the we-ness with regard to the I-ness, the more smoothly will group activity proceed. A good example is given by Rivers, who describes how his crew of natives manned his boat without previous consultation. Of course, what is true in primitive societies is also true in our own, with the difference that our particular form of society has led to a relatively great independence of the individuals and concomitantly to a weakening of group structure. How strong, despite this development, our connection with a group is appears when this connection is broken and the individual isolated. A German psychiatrist, Schulte, has actually explained a grave form of insanity, paranoia, as the result of such a breach ("Versuch einer Theorie der paranoischen Eigenbeziehung und Wahnbildung" in *Psychologische Forschung*, vol. v, 1924, p. 1-23).

The term social consciousness lends itself also to a wider use. Not only does it cover those cases where the group acts as a whole but also those where the members of the group deal with each other, and it extends in fact to all contacts between individuals; for the forces which pull and push the ego are strongest when they are directed toward or issue from a you. How are groups established, when do I behave in a friendly and when in a hostile way, where do I feel inclined to lead or even to command and when to follow and obey? All these questions and countless others require a wide use of the concept of social consciousness as our direct experience with regard to our fellow creatures. To answer such questions by recourse to individual instincts, like the gregarious, the assertive or submissive instinct, is quite inadequate. Quite apart from the fact that some

individuals will more frequently lead, others more frequently follow, there are social situations as conscious events which call for one or the other type of behavior.

There is another aspect of social consciousness, what the Germans have sometimes called the *objektiver Geist*, what Sapir in his illuminating discussion (in the symposium, *The Unconscious*, New York 1928, p. 114-42) treats as the socially unconscious—those customs, modes, fashions, creeds, which permeate our whole behavior to such an extent that it is impossible to find a single action which is entirely removed from their influence. Life in a group builds up a system of codes or standards, which, without being conscious, condition our experience and behavior. An excellent example is the grammar of the language we speak; this appears as a highly intricate system of rules in the hands of the grammarians, yet it is used with perfect ease by the alphabets of primitive societies. Moreover, social behavior creates in itself new and relatively permanent conditions for social behavior. Man creates objects, houses, tools, clothes, ornaments, up to the highest products of technology, science and art, and these products of social activity become powerful conditions of future activity. The group mind then must be given a wider meaning than group consciousness; it must include all those non-conscious determinants which have their origin in social life.

CONSCRIPTION is the exaction by the state of military service. In substance it may be considered the earliest method of building an armed force, since among primitive peoples and among new communities fighting for life the army includes every able bodied man in the community. Such universal military service, however, differs from conscription in that the latter is a deliberate levy by the state in preference to other possible means of building an army and is imposed on a selected group of citizens who would otherwise have the choice of non-participation if they so desired.

With the growing complexity of non-belligerent activities universal service was replaced by a professional standing army supplemented in war time by volunteer service and even by the organization of mercenary forces. These sources of military strength were sufficient until the latter part of the seventeenth century. By that time the diminished lure of the profession of arms, in the face of more certain economic advantage at home, and the diminished emotional attraction of war, as the self-preservation and religious motivations became less compelling and that of political strategy became more obvious, resulted in insufficient standing armies and unreliable reserves in volunteers. Thus conscription was resorted to and the tendency has steadily increased, its use by one nation leading necessarily to emulation by others.

The first moves toward conscription in the modern sense were made by the French monarchy of the late seventeenth century, which attempted in the course of its chronic dynastic warfare to supplement its standing forces without occasioning the heavy drain on the royal treasury that mercenaries involved. The statesman Louvois in 1688 conscripted certain non-exempt groups of citizens for temporary service. They were drawn by lot in the parishes of the kingdom and were not amalgamated with the

regular troops but were used at interior posts, on lines of communication and for the occupation of conquered areas. In the War of the Spanish Succession early in the eighteenth century this distinction was obliterated. Those who were drawn for the *milice* were mingled with other troops and the entire contingent was sent to the front to swell the fighting forces. The *milice* was unpopular, however. Dubois-Crancé speaks of the "trembling hand and frozen heart" with which the black ticket was drawn. The *cahiers* which in 1789 listed the grievances of the parishes of France seldom failed to mention the system, administered as it was with many exemptions and much favoritism. Although it had originally been intended only as a supplemental force for occasional use it was given regularity and even a degree of permanence by the constant wars of the eighteenth century.

All distinctions and privileges were swept away in the great turmoil of the French Revolution. At first volunteers were sufficient to supply the necessary military force. But as danger still threatened and as the idea of popular participation in government deepened, it came to be felt that all Frenchmen owed military service against those who would reinstate the Bourbon king. Various measures were attempted which embodied the idea of conscription, but the most successful was that of 1793, which made all able bodied men between eighteen and twenty-five liable to service. The limits were narrow enough to make organized resistance unfeasible, and conditions at home, moreover, were so uncertain as to make the army a not unattractive alternative. In 1798 at the instance of General Jourdan the principle of conscription was incorporated in the constitution, and thus the French army became entitled to the service of every able bodied citizen between the ages of twenty and twenty-five. These together with the regular troops formed the armies that Napoleon led to victories and furnished the archetype for the extension of the system into each newly annexed territory. The draft had been suggested by Washington and it had been used in Massachusetts and Virginia in 1777, but this was the first widespread application of conscription.

Even with its security in the constitution, however, conscription did not persist in France. Toward the end Napoleon's armies were raised largely abroad and were conquering militarists rather than militant liberals. At the restoration

the government went back to reliance on volunteers, with a few additional soldiers drawn by lot. Napoleon III after his success at overthrowing the Second Republic with a small professional force reverted to the principle of the standing army. But with Gambetta and the rise of the Third Republic the principle of conscription was for a time reestablished.

In the United States conscription was resorted to in the Confederacy in 1862 and it provided many of the final forces of the Union from 1863 to the end of the war. These were war measures adopted to meet emergencies for which existing policies and plans had been found inadequate. In both cases the volunteer system failed to raise the necessary troops. In America in spite of objections conscription succeeded. It enrolled needed man power, held in service short term volunteers who would otherwise have returned home, and stimulated men to enlist in order to avoid the stigma of the draft.

The effect of conscription in Japan is especially significant. When the nation developed beyond the tribal system, the samurai, a military caste, became the exclusive fighters of the country. After the Meiji restoration of 1868 there came a great increase of national spirit. The first step was the destruction of feudalism and of the military class, whose exclusive possession of political power had resulted in a decline of imperial strength. Imperial guards and four garrisons were formed, and then in 1873 under the influence of a French military mission conscription was adopted and military service was opened to all classes. A German mission carried on instruction from 1885 to 1894, and since that time the army, conscripted from what had previously been considered the non-fighting classes, has been a well organized unit. It was the old story of abolishing the privilege and arrogance of professional fighters, who in this instance were also politically powerful.

Prussia furnishes the truest example of conscripted military service in combination with nationalist ideals. Humbled by Napoleon's Treaty of Tilsit (July, 1807) she was compelled to reduce her army to 42,000. The glory of Frederick the Great's professional force had departed. The nation was imbued with many of the democratic ideals which the French were carrying by force of arms across the frontiers of old despotic monarchies. Between 1807 and 1813 Baron von Stein together with General von Scharnhorst effected military reforms in

Prussia which had far reaching effects. He discarded hired mercenaries, stopped the enlistment of foreigners, abolished class distinctions and special municipal and class exemptions, apportioned military service territorially. He trained his 42,000 men, sent them home, trained 42,000 more and in 1813 he was able to put immediately into the field an army of 270,000. On September 3, 1814, Boyen's military law was proclaimed, based on the principle that every citizen is bound to defend his fatherland. It is not too much to say that Germany owed her strength during the nineteenth century to that law and that the whole face of Europe was affected by it. German effectiveness in 1870 startled the world, and since that time England is the only great power in Europe that has not adopted conscription as a defensive measure even in peace time.

The World War, however, brought England also to the expedient of conscription; and it was only by this method, with exemptions for men engaged in work of "national importance," that she was able to carry on the struggle. In 1917 the United States profited by British experience. Although compulsory soldiering was foreign to the temperament of the people and first talk was of financial and economic conscription only, the need for soldiers and for enrolling them systematically soon became apparent. The act of May 18, 1917 (40 Stat. 76), set age limits from twenty-one to thirty. The act of August 31, 1918 (40 Stat. 955), extended the limits to include men from eighteen to forty-five. In eighteen months under the draft system American officials enrolled 23,908,576 men (not including enrolment from the territories), carried through a comprehensive system of economic and industrial classification, placed under arms 2,787,024 men whose withdrawal was least harmful to industry and at the time the Armistice was signed had available 2,000,000 more men who were ready to move. This was effected through a powerful popular opinion roused to war heat and through brilliant organization. Administration was highly decentralized, mainly civilian in character and operated through existing agencies with the full cooperation of state and county officials, volunteer assistance and advice from local medical, legal and industrial experts.

Some nations, such as England and the United States, have prescribed that compulsory service shall be invoked only in case of war, but even as a peacetime defense measure con-

scription is almost universal except for these nations and those disarmed by the peace conferences. Several countries use drawing by lot as a method of selection. Many allow exemptions for dependency, religious scruples, educational training. Still further exceptions from the draft have been found inevitable in order to continue the industries and occupations essential both to the army and to the population at home. But the general spirit of the principle is a universal obligation to serve—a specified time as active soldiers, a longer time in inactive organizations called for short periods to refresh habits and knowledge, and for many succeeding years as mere "available" for use in local defense and for guard duty on public utilities and transport routes. Distribution is geographical, each section being assigned certain corps which it is expected to raise in event of war, with a standing force furnishing first line troops and the nucleus for additional increments. In general the allocation of units, of reserves maintained in skeleton form and of prospective units to be raised in war time is carefully calculated on the basis of known potential man power.

Conscription as a recruiting measure in war time was proved by the World War to be practically inevitable. Generalizations are almost worthless concerning the effects of peacetime conscription, in the form of universal military training, on industrial conditions, health, family life and other institutions and conditions that might conceivably be affected. Its potentiality in heightening nationalist and militarist sentiments is more obvious although not entirely determinable. A citizenry automatically trained in peace time to military ideals and practices will have those ideals and practices more deeply rooted than will a citizenry whose only consciousness of the army comes with the impact of war. And it has been a commonplace among political theorists that a strong army is not only an inducement to militarism but also a menace to the civil arm of government. Conscription, although not inconsistent with the collectivism implicit in the ideal of democracy, is inimical to the individualism and desire for personal liberty from which that ideal developed. Bearing the burdens imposed by the government becomes more pertinent to the individual than sharing the privileges it grants.

The conscription system, however, acts as an instrument of democracy in bringing the rudiments of political awareness more immediately before the people than the ballot ever

could. It converts the government from a remote functionary into a compelling reality. It proves also a powerful instrument of democratization in the ranks. The average intelligence and degree of education among drafted men are higher, and the varieties of social strata which they represent are greater, than among the regulars of the professional army. The compulsory service army is a better representation of the entire citizenry in spite of the partial elimination of the more desirable elements by training them for reserve commissions. Personally men from different social strata may not mix. Differences in intelligence, education and social attributes may militate against real comradeship. The men may not speak the same idiom or use the same slang. Nevertheless, there is in the conscription system a leveling, a community of citizenship, which arises from the basic conception that military service should rest not upon ardor, mercenary motive, caste or feudal obligation but simply upon the duties of membership in the political association for whose maintenance and defense an army is formed.

The United States Supreme Court decision in *Arver v. United States*, 245 U. S. 366, is a fully reasoned analysis of conscription as a political fact; *League of Nations, Armaments Year Book 1928-1929* (Geneva 1929) contains detailed information concerning the extent and duration of compulsory service among the principal nations.

CONSEIL D'ÉTAT, the supreme administrative council and administrative court of France, had its origin in an executive council of the same name established in the year VIII (1799). It was

modeled after the Conseil du Roi, which under varied forms had for centuries advised the kings of France on matters of legislation, administration and justice but which had been abolished at the time of the revolution. Like its prototype the Conseil d'État had only advisory powers, but under Napoleon it exerted considerable influence in shaping legislation and ordinances and in deciding questions of administration. In addition, in harmony with the French conception of the doctrine of the separation of powers, which excluded from the jurisdiction of the civil courts all controversies involving the administration, the council was given power to hear and give advisory opinions in such cases. In this way the administration was freed from any interference by the courts. In 1806 a Commission du Contentieux, which had the character of a veritable administrative court, was organized within the council, forming the embryo of the council's present judicial sections.

Under the successive regimes which followed the downfall of Napoleon the council went through various mutations, which cannot be described here. It received its present form mainly by an act of parliament promulgated on May 24, 1872, which has been modified and extended in certain particulars by various laws and decrees, principally those promulgated in 1879, 1900, 1910 and 1923.

The council is composed of two classes of members: ordinary and extraordinary. The former includes thirty-five councilors in ordinary service and seventy-seven members charged with the preparation of reports—thirty-seven masters of petitions (*maîtres des requêtes*), eighteen auditors of the first class and twenty-two of the second class. The extraordinary members include the minister of justice, who is ex officio president of the council, the other ministers and twenty-six councilors in extraordinary service, high administrative officials who hold their seats only so long as they remain in active administrative work. Councilors in ordinary service alone possess full deliberative powers; all others vote only on matters affecting their departments or on reports which they have helped prepare, except that auditors vote only in the sections and not in the general assembly.

The members of the council are appointed by the president of the republic, which of course means in practise appointment by the ministry. The ministry, however, does not have an entirely free hand in making its selections, since two thirds of the councilors in ordinary service

must be chosen from the *maîtres des requêtes* while three fourths of the latter must be selected from among the auditors of the first class. These in turn are taken from the auditors of the second class, who are selected by competitive examination.

Unlike the magistrates of the regular judicial courts and also unlike the judges of the German administrative courts the members of the French Council of State hold office at the pleasure of the government. This is mainly the result of the fact that the council was originally an executive council and still is an administrative council as well as a court. The dependence upon the government, while theoretically objectionable, is in fact not serious, since there have been no cases of arbitrary dismissal or the exercise of official pressure by the government upon any member of the council since 1879. The judicial independence of the council is strengthened by the provision that all extraordinary members are automatically excluded from participation in the council's judicial work.

Since 1923 the council has consisted of four administrative sections, each charged with deliberating upon a particular group of affairs, and two judicial sections: *le section du contentieux*, with general jurisdiction, and *le section spéciale du contentieux*, with jurisdiction mainly over elections and taxes. The judicial sections are subdivided by law for more efficient operation.

The council still combines legislative, administrative and judicial functions, but their relative importance in the work of the council has varied with the passage of time and the different forms of government. The extensive legislative functions which it possessed during the Consulate and First Empire have long since disappeared, largely as a result of the development of real parliamentary government in France, and today they embrace only the right to give advice upon legislative *projets* submitted to the council by the ministry and to draft bills upon request of the government. In fact, the council is rarely called upon for either service, but its practise since 1907 of annulling for excess power supplementary presidential ordinances issued under the authority of parliament gives it a veto power over a large body of important executive legislation.

Its administrative functions are much more important. They consist mainly in the giving of opinions (*avis*) upon administrative matters laid before it by the government. Frequently the law

requires that it be consulted and its opinion obtained, but on account of the French traditional distrust of the division of responsibility the government is not required to follow the advice given. In a few cases the approval of the council is required.

The judicial functions of the council are the most important today. They embrace the rendering of decisions in the last resort in two sorts of cases: administrative controversies, or complaints brought by private individuals against the state, the departments or the communes for the enforcement of legal rights; and petitions to annul, for excess of power, acts of the administrative authorities such as ordinances and decrees of the president, ministers, prefects and mayors. It possesses appellate jurisdiction over the decisions of the Court of Accounts and the various inferior administrative courts. In time of war it also serves as the supreme court of appeal in prize cases. Its decisions since 1872 have not been, as they were formerly, in the form of an *avis*, the final decision remaining with the head of the state (*justice retenue*), but are in the form of final judgments (*arrêts*) which it renders in pursuance of its delegated judicial power (*justice déléguée*).

The somewhat general authority conferred on the council by the law of 1872 has been broadly interpreted. By a long succession of decisions the council has, in conjunction with the Tribunal of Conflicts, built up a large body of case law for the protection of citizens against the illegal and arbitrary action of the administrative authorities. It has established the doctrine of the responsibility of the state, the departments and the communes for damages sustained by private individuals on account of the acts of the public authorities. The legality of nearly every act of an administrative agent, from the president of the republic down to the mayor of a petty commune, may be attacked for excess or abuse of authority by a suit before the Council of State. The only exceptions to this power of review are certain political acts of the president, such as the summoning and adjourning of parliament, acts having to do with the conduct of foreign relations and certain so-called *actes de gouvernement*, such as extraordinary measures for the maintenance of the national defense in time of war or in grave crises. As a result the individual in France enjoys a degree of protection against the arbitrary and illegal action of the administrative authorities and a certainty of reparation for damages such as is unknown in Anglo-Saxon

countries. The procedure for the enforcement of the remedies thus provided is simple and inexpensive and the congested dockets of the *section du contentieux* evidence its popularity as a court. Designed originally to free the administration from judicial restraint the council has evolved into a very effective check upon the highly centralized French administrative system. The proposal is sometimes made today that as a final step in that evolution the council should relinquish the remnants of its legislative and administrative functions and become solely an independent administrative court of final jurisdiction.

CONSENSUS. According to the dictionaries consensus means agreement. But the quality of the agreement reached in a consensus is quite different from the quality of other types of agreement—conformity, for example. In both cases what the agreement is depends on the situation from which it emerged. But no social situation is static. The social process reveals both temporal structure and structural tempo. Its component changes proceed at varying rates and in diversified directions, the slow and massive tides of the folkways and mores being basic and secret and the rapid turnovers of cults, crazes, opinion and fashions overt and secondary. Changes take place in two ways: first, by the autonomous variation involved in the passing of time; second, by the responsive variation caused by outer impacts that either reinforce or distort the spontaneous inner changes. The consensus is a phase in changes of the second kind. It may be described as a sort of plateau in the skewed curvature of social change. It can be observed at any level of the temporal structure of societies. It is the pattern of cohesion in folkways and mores in so far as those are the homogeneities of thought and behavior set up by the confluence of several heterogeneous systems of group conduct and their rationalizations. It is, more obviously, the pattern of cohesion in all cooperative resolutions of conflict between the members of a single group or between separate and distinct groups. Usage tends to limit the application of the term consensus to phenomena of this latter type; that is, to resolutions of conflicts the sequential pattern of whose development is obvious, whose tempo is rapid and whose direction and range are limited. We say "consensus of opinion" but not "consensus of custom."

The probable reason lies in the fact that the consensus which custom perpetuates is so ancient and so established that no sense survives there of heterogeneous origins and of conflicts reconciled. Every consensus is a won agreement; to realize it as such requires a background of awareness of disagreements from which the harmony has emerged. This has a very different quality from the agreements set up by conformity or coercion. The latter presuppose a relatively weak and plastic minority and a relatively powerful and rigid majority. Agreement by conformity comes about as the voluntary adjustment to a social environment over which the conformer has no control. Coerced agreements *per contra*, are involuntary.

The antecedents to a consensus are quite different. The parties to the initiating conflict presumably enjoy parity. The confronted interests are alike in freedom and importance. The issue between them gets joined not by exclusion and antagonistic imposition but by reciprocal interpenetration. All are active and plastic. Each modifies the others and is modified by them. There is a circular give and take, in the course of which a collective emphasis of this and a collective repression of that item of the issue establish themselves; exclusions and oppositions weaken and become recessive; agreements strengthen and spread. At the end the initial aggregation of opposed individuals has become an integrated association with organically related members; the opposed interests have molded each other into a mutually sustaining configuration where each has acquired a new character and new values and where all have brought the social process to a stable new level and tempo.

The conspicuous examples of this essential process are to be found in the history of ideas, especially in the natural sciences, where all agreements must have the nature of a consensus. Let a new theory be propounded in any given field and it is at once confronted by the older theories already prevailing; it is analyzed for internal cogency and tested for experimental relevancy. The arguments and the experimenting modify it *ambulando*; when they come to rest, the theory which emerges has neither all the features of the new theory in its first form nor many of the prevailing ones that then confronted it but presents an interpenetration of the qualities of each, mutually transformed. Thus the consensus concerning evolution neither rehearses Darwin nor his primary opponents nor his later alternates but borrows something of the contributions of each and embodies a configuration which has in the large the free and general assent of biologists and laymen. In physics the phases through which the theory of relativity has passed or the conception of the ultimate structure of matter (from the determinate atomic constellations of Bohr to the ambiguous patterns of Heisenberg) exhibit the same relationships.

The process of consensus is not so clear and explicit in fields of social action such as economics and politics, but there too it is operative. Thus the history of such an idea and program as socialism falls into a pattern like the history of evolution. Confronted in its beginnings by violently opposing interests, the long give and

take, theoretical and practical, between them and socialism is emerging in a politico-economic consensus which has the features exclusively of neither the original Marxism nor its antagonist doctrines but is a compenetration of all; the most ardent capitalist holding something in favor of, say, "economic determinism," and the most passionate socialist something in favor of the actualities of the industrial process.

A consideration of the idea and program of prohibition will point this interpretation of consensus. As a sumptuary principle prohibition was first propounded in a world whose mores included and still include the universal consumption of intoxicating beverages as an important component of the way of life. There was a widespread and powerful moral and material investment in liquor. Agitation to prohibit its use came in with the factory system and the great city. It got indirect aid and comfort from the rise of the cheap press, the phonograph, the motion picture and the other mechanical alternatives to liquor as a sedative and excitant. It drew direct reinforcement from new views concerning the depressing influence of alcohol on physical and mental efficiency, which won it the support of great industrialists. At the same time that the Eighteenth Amendment to the Constitution of the United States was enacted prohibition as an agitation was beginning to have an effect on the mores. But the interests and insights involved were still in conflict; no consensus had formed itself. Prohibition as a program was a coercive imposition, not a free agreement. The law made the selling and buying of alcoholic liquors a crime; the mores of the community held them otherwise. The consequence is that public opinion in the United States now sanctions an elaborate machinery of lawlessness (racketeering) which involves the major crimes and remains unrebuked by the conscience of the community. In a word, except by the use of *force majeure*, a law is enforceable only when and as it expresses a consensus which a community has reached. Lacking the consensus a legal crime may be a social virtue and religious heresy a moral duty.

CONSERVATION. The protection of the resources of man's physical environment against waste is now a major problem of civilization. With the development of agriculture man sharply modified the existing flora and fauna and greatly accelerated the rate of land degradation. In the brief interval of recorded history removal of the forests and tillage with subsequent erosion of the soil has destroyed great areas of formerly useful land, especially in China, in the Mediterranean region and in North America. How far this has been a cause of failing water supply and destructive floods is uncertain, but the process of soil impoverishment and erosion can be seen at work on an appalling scale in such areas as the southern Appalachians and the gullied lands of Tennessee.

A far reaching depletion of mineral resources is more recent but no less ominous. Production of the metals and the mineral fuels has grown in geometric ratio, increasing nearly a hundredfold in the century before the World War. Since 1890 the world has used more coal and metal than in all previous time, and consumption is still increasing. The modern world has adjusted itself to the exhaustion of individual deposits by the discovery of new deposits, by transportation of materials formerly inaccessible, by substitution and by advances in technology making possible the use of lower grade deposits and the reduction of costs of both mining and smelting. The combined effect of these factors for the world as a whole has up to the present offset the tendency toward increasing cost through depletion of the richer deposits, and prices of the minerals have been falling. In the older districts and countries, however, the factor of depletion has frequently outweighed the advance of technology. England in the first half of the nineteenth century was not only the largest producer of coal and iron ore but the principal source of the world's copper, lead and tin. Today the copper is all but gone, the lead and tin are nearing exhaustion and the output of the Cumberland iron mines, the only source of rich iron ore in Great Britain, is steadily declining. The mining of coal has entered the stage of increasing costs, and in spite of the ingenuity of British engineers the output per man per year has been declining since 1883. The

present economic difficulties of England are due in part to the unequal competition between a land in the stage of increasing costs of mining and newer lands where costs are declining and the yield per miner is still on the increase.

In North America dissipation of the resources has been more rapid than in the Old World, although masked by the development of new sources of supply and the progress of techniques. Abundance of land led the American pioneers to recklessness in tillage, the results of which were rendered more serious by torrential rainfall. The forests were an obstacle to be hacked and burned away and the waste in the exploitation of the minerals was likewise great.

The conservation movement began in the last half of the nineteenth century with the realization that the resources of the continent were not inexhaustible. Attention was first drawn to the decline of the fisheries and the destruction of the forests. The office of Commissioner of Fish and Fisheries was created in 1871. A memorial of the American Association for the Advancement of Science in 1873 began a movement which led to a forestry bureau in the federal Department of Agriculture and to the creation in 1891 of the first national forest reserve. Other landmarks in the movement were the organization of an irrigation division in the United States Geological Survey in 1888, later developed into the reclamation service, the work of the survey in cataloguing and classifying the resources of the public domain, and the creation of the mining technology branch in 1907, expanded into the Bureau of Mines in 1910. An act of 1906 protected the Alaskan fisheries. Impetus was given to the movement by Gifford Pinchot and President Roosevelt through the Inland Waterways Commission of 1907, which stressed the connection between the forests, water supply and stream flow, and the National Conservation Commission of 1908.

The work of the Roosevelt conservationists was inspired in part by the need of preventing waste and in part by the frauds and evasions practised under the existing land laws. The abuse of the early preemption laws and of the Homestead Act of 1862, the Timber and Stone Act of 1878 and the "forest-land" indemnity selection provisions of 1897 had resulted in the acquisition by corporate interests at nominal prices of most of the forest and mineral wealth of the original public domain. The steps now taken were largely intended to prevent such abuses. By executive order the unappropriated

forest lands on the public domain were set apart for national forest reserves, and later under the Weeks law in 1911 the federal government was authorized to acquire additional reserves by purchase. The unappropriated mineral bearing lands, excepting the metals which were as before open to prospecting and the location of claims, were withdrawn from settlement until they could be classified, pending a change in the land laws. After much debate Congress in 1920 passed the Mineral Leasing Act, opening deposits of coal, oil, gas, phosphate, potash and salines to prospecting and leasing under supervision of the Department of the Interior, with payment of royalty to the United States. The development of water power on navigable streams, which had formerly required a special act of Congress, was by the Federal Water Power Act of 1920 placed under control of the Federal Power Commission. The law provided a system of licenses for fixed periods, reserving to the federal government the right of purchase at the expiration of the license upon payment of the actual investment made.

Among the strongest supporters of the policy of conservation had been the nature lovers, whose interest found realization in the National Park Service organized in 1916. Powerful support came also from the advocates of national defense. To assure supplies for the army and navy, reserves of oil, oil shale and helium bearing gas were set aside, and in 1929 additional reserves of coal, especially suited to conversion into oil products, were established.

Changes in the land laws were not accomplished without opposition. Private interests affected by the new policy waged a campaign against "Washington bureaucracy," and the public land states contended that the resources belonged to the local inhabitants rather than to the nation. As federal lands were not subject to state taxation, the new policy was held to reduce the revenues of the states at the same time that their citizens were paying royalties into the federal treasury. In deference to this view, the Mineral Leasing Act as finally passed after twelve years of discussion provided that the royalties collected should be divided between the United States Treasury, the state in which the deposit lay and the general reclamation fund. A similar division is made of revenues from the national forests and from power licenses. In deference to the charge that development would be delayed no discretion was given to the Department of the Interior to withhold a mineral

lease, regardless of public interest in controlling overproduction. With these concessions to private and state interests the administration of the Mineral Leasing and Water Power acts and forest reserves has on the whole been successful, but the administration of the naval oil reserves under Secretary of the Interior Albert B. Fall reached the lowest depths of corruption.

By the passage of the new land laws the conservation movement accomplished one of its primary aims, the protection of the remaining public domain against looting by private interests. The resources to which the nation thus retained title were, however, largely marginal, representing except for water power only what private interests had overlooked or passed by as of small value. The federal government is now the owner of a number of irrigation projects developed on sites which private capital had found unattractive; of an imposing acreage of forest reserves, most of which is of doubtful value for lumbering and which produces only four percent of the present cut; of significant areas of theoretically potential oil bearing land on which to date only a few rich pools have been found and which produce about three percent of the present output; of a vast area of unappropriated arid land, most of which is of doubtful value even for grazing; and of immense reserves of low grade coal, lying in the Rockies and in the Great Plains, most of it too remote from transportation or markets to have cash value.

With respect to the other objective of the conservation movement, the prevention of physical waste, the progress to be recorded is less imposing. On the small percentage of the resources remaining under direct public control the government has been able to minimize waste. The forest reserves have been protected against fire, the cutting of timber is carefully managed, and the system of permits has allowed use of the reserves by stockmen without overgrazing. The regulations written into the coal and oil land leases have set high standards of engineering and of safety. The example of the federal government has stimulated action by some of the states, particularly in the creation of forest reserves and the protection of game. The government's activities in research have been significant. Erosion, depletion of soil fertility and overgrazing of private lands continue, however, on an appalling scale; shore-breeding species of fish are diminishing; the private forests are being butchered and the cut over lands burned. Although lumbermen admit the need of conserva-

tion, competition in an overdeveloped industry and a faulty system of taxation prevent either adequate fire control or reforestation. The waste in the mining of bituminous coal averages thirty-five percent, of which twenty percent is avoidable. In petroleum production as a result of competitive drilling the losses of oil through premature encroachment of salt water and failure to utilize fully the pressure of dissolved gas in recovering oil are formidable, to say nothing of the loss of gas itself and the sacrifice as boiler fuel of a substance potentially more valuable as gasoline. In both lumbering and mining the causes of losses are largely economic and legal. The application of the common law concepts of private property in agricultural land to property in forests and minerals, particularly to the migratory minerals oil and gas, and the desire for immediate profits create a tendency to overproduction. The problem is to permit group action to restrain the wastes of competition and at the same time protect the public against excessive prices—a problem rendered difficult by the existing antitrust laws, the deep seated fear of combinations among competitors, the opposition of the industries to regulation lest profits be curtailed and the confusion of state and federal authority. In lumbering and bituminous coal mining the obstacles have thus far set at naught all attempts toward unification of policy. In the petroleum industry a prolonged period of overproduction and low prices induced the American Petroleum Institute to propose a nation wide plan for the limitation of output. No authorization of such action was found in existing federal law, and subsequent efforts to effect the same result by an interstate compact between the oil producing states have thus far failed. Local experiments in the control of flush production in new pools of Oklahoma and Texas under agreement authorized by the state public utility commissions have recovered a higher percentage of oil at a lower average cost, and California has passed a stringent natural gas conservation law, which while saving oil and gas also promises to limit overproduction in new pools. These scattering developments, however, only serve to emphasize the prevalence of destructive competition with its concomitant waste.

The success of the conservationists in checking the wastes attributable to the competitive system is small. But chemists and engineers have aided conservation by their improvement of technical processes. In the production of lead and zinc, for example, they have made possible

selective flotation and the recovery of large amounts of both metals which were formerly wasted because they could not be separated. In the production of oil they have developed methods for cementing wells against infiltration of salt water, a technique of secondary exploitation doubling the possible recovery of the oil contained in the sands, and have advanced the art of drilling, carrying the maximum depth of wells from 3000 to 9000 feet. The introduction of cracking in the refining of petroleum has doubled and trebled the percentage of gasoline obtained from the crude. Particularly striking is the advance in efficiency of utilization of coal. In 1908 electric central stations in the United States consumed an average of 5.3 pounds of coal in generating 1 kilowatt hour; in 1929 they required only 1.7 pounds, while the best plants use 0.9 pounds. In the meantime the process of converting coal into oils or alcohol, which was developed by Bergius and Fischer of Germany and Patart and Audibert of France, promises that the world's need of gasoline can be met from coal when supplies of petroleum fail. Such technological changes conserve the natural resources and lengthen the prospective life of the fuel reserves. Owing in part to the stimulus of the conservation movement the advance of mineral technology has been faster in the period since 1908 than at any time since the industrial revolution.

CONSERVATISM. This word has two chief uses. The first is technically political, in which it means a tendency to maintain the status quo regardless of what that may be. In this sense the word is devoid of philosophical content, and one may logically designate as conservatives the most disparate political parties and factions. A party conservative in this sense may in the past have been revolutionary and without any change of theoretical position on such basic questions as, for example, liberty and authority may have become technically conservative on the successful completion of the revolution. Thus from this point of view the Bolsheviks of today are as conservative as the czarists of yesterday, the Fascists in Italy as the liberals of 1921, all being (or having been) equally disposed to conserve things as they are at the moment.

The term also has a philosophical use and meaning, in which case it implies a particular *Weltanschauung*, such as love of authority and tradition (monarchical, ecclesiastical or liberal in oligarchical form), which may in turn be but a reflection of particular psychological conditions, although they may appear as wholly rational conceptual preferences. Fear and habit, education, in so far as it contributes to establishing the hold of these and to the building up of respect for tradition and authority (both of which it often does at a very early stage), and the effect of age, with its physical decay entailing psychological changes such as inflexibilities and disillusionment, tend to create conservatism in this sense or to fortify rationalizations of conservative attitudes, i.e. to give ideological content to them. On the whole, age is more conservative than youth. In practise, while the philosophical conservative often tends to desert his ideology, if changes are brought about despite him, and to take on a new attitude favoring change (change in a backward direction, i.e. reaction), the political revolutionary on gaining control attempts to utilize for the support and perpetuation of the new order such values as authority and tradition and such factors as fear, habit and education.

Concretely, conservatism means hostility to

innovations in the social or moral order. Undoubtedly the classes which most readily experience conservative feelings and work out complementary ideologies are the wealthy classes, those who have something to conserve. As Ronsard said, "Donne tout à ceux-ci, rien à ceux-là; les uns devront conservateurs, les autres tribuns" (Give all to one and nothing to the rest; the first will be conservatives, the rest will be the rebels). Nevertheless, poor (although not starving) people can also be conservative; however little they have in comparison with others, psychologically they are prepared to put up with the little through fear of having less. Religious influence often contributes to create such a state of mind. Conservatism is not opposed solely to economic or political change; it dislikes, for example, any wide modification of traditional family life. Yet the attitude of conservatives toward feminism may vary in different epochs and countries; in contemporary Spain, France and England most conservatives favor women's suffrage, while in Switzerland and Italy most oppose it.

Conservatives have much in common with aristocrats. They rely on a knowledge of history to avoid repeating past errors. They believe that aristocracies are relatively stable, democracies fickle and hence inconvenient to the state's successful functioning. Conservatism argues that political as well as other useful capacities often descend from father to son as a result of biological and educational causes: pride, sentiment of honor, *esprit de famille*, *noblesse qui oblige*. One of the main political bases of conservatism is the hypothesis of the higher capacity of the ruling class; the existing order is thus justified morally and technically as coinciding with general welfare and in accord with the law of the survival of the fittest. In general, conservatism fights "mob law."

Carlyle asserted that all great peoples are conservative, slow to believe in novelties, patient of much error in actualities, deeply and forever certain of the greatness that is in law and in custom once solemnly established and long recognized as just and final. Certainly there must be a conserving purpose. But the aim to conserve the social organism is the common end of every imaginable political activity; the conserving purpose therefore does not serve to distinguish one special kind of political theory from another. The distinction appears only when attention is focused on the preservation of particular institutions deemed necessary or es-

sential for the maintenance of the existing social order. A substratum of conservatism exists in all societies. The growth of party organization is inevitably followed by overwhelming conservative tendencies, even in radical parties. When conservatism in the above sense is a conception of life, the status quo constitutes the ideal of conservatives only inasmuch as state and social conditions correspond to and suit their convictions and interests. When the concrete forms and the legal institutions pleasing to their *Willensschauung* are abolished, they shift their allegiance to the status quo ante. Thus dethroned conservative parties become in their actual politics and aims more or less revolutionary, as in the case of contemporary monarchists in Russia, France and Germany. Even when the social order they desire to conserve is merely threatened and in a manner not inconsistent with the traditions they theoretically defend, conservatives generally stop behaving as conservatives and, sometimes accompanying action with ideological shifts to justify it, violate their own code to avoid the danger of disappearing with it.

Particular metaphysical conceptions lead to the view that all that is, being God's work, is good; and religion often becomes both a creator and a support of conservative attitudes. A love of traditional aesthetic values may also lead to conservatism. The social conservatism of such a man as Ruskin and his yearning for ancient arts and crafts were largely based on a love for English landscapes which were being metamorphosed by the chimneys and smoke, the mills and factories, of the new industrial system.

Even in the economic field the laws of maximum satisfaction and supply and demand may be upset by conservative states of mind. Consumers do not often buy where the best bargain is to be had but in shops to which they are accustomed. Men renounce financial gain to cling to old habits of family life or to localities in which they have grown up. The force of habit and moral conservatism thus frequently destroys the fiction of the economic man.

Conservatism, then, being largely a reasoned or unreasoned resistance to any change, often means laziness, idleness, failure to think, an incapacity to question traditional concepts. The conservative's reference to historic experience is often highly selective; he paints the moral lessons which lend support to his particular interests. He develops a general prejudice against thought, regarding habit rather than reason as the best guide to conduct. Conserva-

tism seeks, with Burke, peace rather than truth. Hence the primitive man, whose life is organized in every detail and who, surrounded by innumerable tabus from birth to death, is a slave of traditions and the least free of humans, is also the most conservative. Conservatism tends to become indiscriminating in its resistance to change. And it will denounce innovators whether in the social, scientific, educational, political or economic field as destructive and utopian, often adding the epithets "insane" and "criminal." Although public opinion may lose its balance and become extremely radical it has been correctly called the headquarters of conservatism. Public opinion is always fanatic and devoid of all basis of real thinking.

Dominant political parties call themselves conservative only after the rise of social danger. The word conservative is said to be derived from Chateaubriand, who with Lamennais established in Paris a newspaper, *Le conservateur*, for the struggle against the revolutionary forces. In England a section of the Tories began to call themselves conservatives about 1835. At about the same time the conservative party in Prussia started as a Junker party. As a party name the word has sometimes changed its content with historical developments. In 1830 after the victory of the French liberals over the conservatives (Légitimistes) the left wing liberals (Orléanistes) took the name of their conquered enemies, calling themselves conservatives. As they had now a new order to conserve their action was perfectly logical.

Conservatism is but one of the forces which rule humanity, for there is also an immanent tendency to change (the two historical laws of *Beharrung* and *Veränderung* of Theodor Lindner). So conservatism must fight to conserve itself. Giovanni Botero asserts that the conquest of power is easier than its conservation. The first secret of continued power is continued conquest. This necessity leads automatically to some fluctuation of social stratification. Neither society nor a social class, however rich and powerful, can be conserved by mere conservatism. Apathy is deleterious, changes are inevitable. The only important question ever at issue is whether they shall come from above or from below. The ruling class can maintain itself without decaying only by receiving into itself the best, keenest and boldest elements of the other classes, as Louis XIV of France urged his nobility in regard to the élite of the bourgeois and the bureaucracy.

Danger of revolution from below is offset by conservatives in two ways. The first is to keep the lower classes poor. As Thorstein Veblen says: "The institution of a leisure class acts to make the lower classes conservative by withdrawing from them as much as it may of the means of sustenance, and so reducing their consumption, and consequently their available energy, to such a point as to make them incapable of the effort required for the learning and adoption of new habits of thought." This policy is not only cruel and immoral but in the long run ineffective and dangerous, inasmuch as misery creates despair and obstruction. The second method is that of social reform. The conservative mind has no fixed attitude toward this policy. Conservatives sometimes oppose state action of reformist character on the ground that it undermines manhood and self-reliance, individual ability and thrift. On the other hand, conservatives often (although slowly) promote social legislation as a *pis aller*, hoping that as long as they direct the reforms no real or harmful change will come about.

Are there ethical or national predispositions to conservatism? Historically Venice has been perhaps the most conservative state; it jealously guarded from change its constitution, mentality and habits for more than ten centuries. For a short time, during the so-called *siècle de Louis XIV*, conservatism had its center in France. Afterwards for a long time it dominated autocratic Russia and bureaucratic Germany, with the difference that while in Russia it meant inflexibility of the legal structure in Germany it meant the idolatry of state authority. Psychologically, however, England being the most traditionalist in customs seems to be the most conservative nation of the world, because the basis of conservatism is found more in the stability of customs than in the stability of laws.

CONSERVATIVE PARTIES. See PARTIES, POLITICAL, sections for separate countries.

CONSIDÉRANT, VICTOR (1808-93), French political and economic theorist. His principal work was to clarify, popularize and apply specifically to the problems of his day the doctrines of Charles Fourier, whose best advocate he remains. As a student at the École Polytechnique he tried to recruit adherents to Fourier's theories and soon became the intellectual leader of the Fourierist group. He edited *Le phalanstère*, which was named after the institution Fourier devised as the basis of his social scheme for harmonizing the "passions" and increasing tenfold the product of labor, and *La phalange*, which was devoted to the same ideas. He published a sort of digest of Fourierism, *Destinée sociale* (3 vols., Paris 1834-44), *Principes du socialisme* (Paris 1847) and other works on the same subject. Considérant at first advocated complete abstention (*l'écart absolu*) from politics and total indifference to political parties in his *Nécessité d'une dernière débâcle politique en France* (Paris 1836). But he gradually came to feel that it was necessary to use the force of democracy to hasten reforms, provided democracy would not be swallowed up by political parties. He wished democracy to transfer its interest from the political to the social field, a view expounded in his *Principes du socialisme, manifeste de la démocratie au XIX^e siècle* (Paris 1847), and to make methods of election more effective in reflecting social views. In 1848

Considérant was elected to the National Assembly, where he played the part of mediator between bourgeois and proletarians. He also served on the Luxembourg Commission. After the June Days he published *Le socialisme devant le vieux monde ou le vivant devant les morts* (Paris 1848), a review of the socialist systems of Owen, Saint-Simon, Buchez, Cabet and Proudhon. Here he argued the superiority of Fourierist doctrine, which requires no constraint and which aims to treat fairly capital, labor and talent by multiplying free associations.

From 1852 to 1854, urged by Albert Brisbane, Considérant attempted unsuccessfully to found a phalanstery in Texas. In replying to Texan objectors to socialism he endorsed democracy and opposed absolutism. After his return to France in 1869 he worked to adapt Fourier's ideas to new developments in science.

C. BOUGLÉ

Consult: Donnemagnet, Maurice, *Victor Considérant, sa vie et son oeuvre* (Paris 1929); Coignet, Madame C., *Victor Considérant, sa vie, son oeuvre* (Paris 1895); Bourgin, H., *Victor Considérant, son oeuvre* (Lyon 1909); Gide, C., and Rist, C., *Histoire des doctrines économiques* (5th ed. Paris 1926), tr. from 2nd French ed. by R. Richards (London 1915).

CONSIDERATION is that element in an informal contract which is essential in Anglo-American law to make it binding. A formal contract is supposed to derive its force from the mere fact that it is under seal. Consideration is currently defined as the "detriment" to the promisee or the "benefit" to the promisor bargained for and given in exchange for the promise. In legal theory the adequacy of this return for the promise is of no moment; a "horse, hawk, robe or tom-tit" will serve to bind any bargain. All that is necessary is that there be proper evidence that the promise is not gratuitous. The commercial England which fashioned the law of contract was not bent on protecting fools from bad trades, but it was determined to protect a man against ill considered offers of bounty and levities of speech.

It is generally conceded that the English law of contract took little from the Roman law except a confusing vocabulary and some misleading maxims. It was the emergence of the principle of consideration that marked the establishment of the modern English law of contract. In the sixteenth and the early seventeenth century the common law was faced with the problem of providing regulations for the trade and commerce which had come under its dominion.

Beginning with no general theory it proceeded outward from particular cases. The requirements of formally sealed documents excluded the general run of contracts. Thus other remedies had to be devised to protect a man in his everyday dealings. An unpaid seller was granted a recovery from the purchaser. A man induced by a promise of another to act to his own disadvantage was given an action against the defaulting promisor for the wrong he caused in failing to fulfil the obligation he had assumed. In a way obscure both in the records and in the writings of modern commentators the actions of debt and assumpsit, under the influence of a Chancery inclined to inquire beyond the form to the general results of a promise to determine the intention of the parties, were fused into a general theory of contract. With gain to the promisor or loss to the promisee as the criterion a promise was considered binding when the promisor's intention to assume a legal duty was evidenced. There were other, non-commercial causes of action which might have proved the analogy for the general theory; if the oath had been given a civil sanction and made to cover all promises, there never would have been the doctrine which took the name of consideration. But the principle of consideration was more acceptable to the puritan temper of commercial England; under it one could not get something for nothing; the law would not enforce a nude, or naked, promise "when a man maketh a bargain, or a sale of his goods or lands, without any recompence appointed for it" (Saint German, Christopher, *Dialogues* . . . , London 1523, American ed. *The Doctor and Student*, Cincinnati 1874, dial. ii, ch. xxiv).

The common law would not enforce an informal promise without some consideration in return for it, no matter how strong the moral duty or the motives. Breaches of faith were subject to the jurisdiction of the ecclesiastical courts; and the church found within itself the power to collect gratuitous gifts, deriving from the Roman law the doctrines to support its demands. But with the increasing complexity of trade secular insistence upon good faith became more pronounced. At the end of the sixteenth century contracts came to consist of mutual promises as well as promises balanced by performance on one side. The common law lawyers, however, rejected the simple theory of mutual assent as the cohesive force; instead they transmuted one promise into consideration for the other. From this it followed that unless the promises were

expressly made dependent upon each other they could be enforced independently. Thus at first a party even wilfully in default could maintain an action upon a bilateral contract, and only a counteraction upon the case was available to the other party. It was Lord Mansfield who in 1772 solved this dilemma by introducing the doctrine of the mutual dependency of the promises. One is told that the reason for this is that the consideration has "failed." Actually there has been only a failure of performance. The theory of the law has never escaped the circular reasoning involved in regarding mutual promises as consideration. But practically there has resulted a temporarily satisfactory adjustment of law to trade.

The last outright attempt to relegate consideration to a minor role as one form of evidence that a promisor has assumed a legal duty was made in the eighteenth century. Lord Mansfield proposed that all promises in writing be regarded as a third class of contracts, irrespective of other consideration. Precedent, however, was too strong and he was promptly repudiated. He proved more successful in his interstitial attack upon the theory; moral obligation was introduced as a form of consideration. For a promise to fulfil a moral obligation otherwise unenforceable it was said that "the honesty and rectitude of the thing is a consideration." Although Blackstone, strongly influenced by Mansfield, accepted this innovation, moral consideration as a principle was sharply restricted by Mansfield's successors. The courts denied that it was sufficient, but the cases in which it had been recognized persisted and the theorists have struggled ever since to transform it into acceptable coin. Promises to pay just debts, recovery of which had been barred because the statute of limitations had run or because the debt had been contracted in infancy or because an affluent debtor had received his discharge in bankruptcy, continued to be held binding. The widespread extension of credit made it imperative that a man's word be trusted and that creditors receive further protection by law. More and more the sanction for avowments was shifting from the morals of the church to the mores of the commercial world.

The current, concise definition of consideration was forged in the last decades of the nineteenth century under the influence of the mechanistic Spencerian philosophy of the period which pervaded all legal thinking. The theorists banished Blackstone, who was content to enu-

merate the various considerations, including moral obligation, and based their universal generalization upon the consideration of the early sales contract of give and take found in Coke.

This modern theory of consideration finds itself adequate in the bulk of cases which are still contracts of barter and trade; but only by tenuous rationalization does it maintain its symmetry where contract law has spread over relationships other than those of simple barter. Recent decades have again shown a tendency to enforce promises made in the regular course of a business transaction. But a sophisticated law of contract, heeding the reversals of an earlier century, has erected a complex superstructure of theory, creating formulae for finding consideration. Promises are drawn by implication from the action of the parties and made to serve as consideration under the circular doctrine of mutual promises; or if the promisee can be shown to have suffered a detriment by relying on the promise, the promisor will be estopped from protesting the lack of consideration. In cases where there is an already existing contract between the parties, although generally the law recognizes no new detriment to the promisee which make new terms binding, liberal courts have held, where to refuse to substitute the terms of a new agreement would result in hardship, that the old contract was rescinded, leaving only the new promise to be balanced by the detriment to the promisee. Again, actual performance of an existing legal duty, such as the marrying of one's fiancée, has been found an additional detriment sufficient as consideration for a promise made by an interested third party, since without the additional inducements one might have breached his promise at the risk of being mulcted in damages. Where promises have been "instinct with obligation," a necessary consideration has found life.

As the common law has extended its dominion, consideration has likewise been found for contracts in support of education, charity and religion. It has become repugnant to the social conscience not to hold a man to a promise given in a campaign for funds for an educational, charitable or religious foundation. In some courts the promises by mutual contributors have been held to be consideration for each other; but only in the realm of metaphysics can it be held that there is mutual assent, a trade of a promise for a promise, that a contributor incurs a detriment or confers a benefit in respect of the promises by others. Again, some action in

reliance on the promise by the recipient foundation has been construed as consideration, and the courts have gone far in recognizing as consideration acts which are no more than a preparation and an expression of willingness to receive the promised money.

In continental law there is no direct analogue to consideration; but the civil law theory of contract has struggled with a somewhat similar problem in the doctrine of *causa* which claims heritage from Roman law. Like the English law, the Roman law did not make all promises enforceable; it also provided against delusions and rash statements. Agreements were at best "nude pacts" unless made binding obligations by a strict performance of necessary formalities. These agreements were classified according to their forms; each contractual form required the fulfilment of its peculiar formality to demonstrate that an obligation was assumed with due deliberation and in good faith. The most flexible of the Roman contracts was the consensual contract, developed to meet the demands of the ordinary trade agreements: contracts for sale, hire, partnership and agency. Subsequently much the same forces which expanded the later English law of contract made other agreements of certain types, such as promises to give a gift up to a certain amount or to give a *dos*, obligatory; but since such agreements did not fit into the established categories of contracts they were treated as pacts vested with obligation in contradistinction to nude pacts. In the consensual contract all encumbrances of form were removed, and such a contract became binding by mere mutual consent. Since consensus alone was not sufficient to make mere pacts obligatory, the "binding fact" for the vested pact was found in the character of its transaction, known as the *causa civilis* or *causa civilis obligandi*.

Causa, however, had a perplexing number of meanings in Roman law, and no completely satisfactory rationale applicable to all contracts appears to have been worked out. In spite of the attempts of the glossators to isolate an element of *causa* in all contracts necessary to make a contract valid, *causa contractus* proved to be but a circuitous way of stating that a promise given within the required form was actionable. In the consensual contract dialectical difficulties similar to that of finding consideration in mutual promises were confronted. A promise was at once a *causa* and the resulting obligation. However, under the influence of the later praetorian law

concerning unjust enrichment and illegality the theory of *causa* absorbed the idea of legal purpose. The early civilians and canonists made of *causa civilis* a mystical, general basis of contract, transmuting its demand of form into a requirement of a lawful subject matter.

Although the general theory of the modern civil law under the influence of natural law ideas has come to be that all contracts are enforceable unless a special reason exists to the contrary, the notion of the requirement of a *causa* has persisted in some countries. In Germany the impression that the old Germanic law emphasized only the idea of good faith prevented this, and *causa* has found no place in the *Bürgerliches Gesetzbuch* or in the codes of those countries which have taken it as a model. But introduced into French law by Domat and accepted by Pothier it has found a place in the *Code civil* and the codes of the Latin countries which continue to use Roman law phraseology. Attempts to establish a general definition have failed to meet with approval. Proponents of the doctrine have found difficulty, as did the glossators, in distinguishing the *causa* from either the object of the contract or motive in general. Anticassualists advocate the elimination of the theory in French law as unnecessary, since obligations can more readily be handled upon the simpler principle that agreement by competent parties concerning an object physically possible and legally permissible constitutes a valid contract.

Continental jurists have developed a broader doctrine of contractual obligation than have the Anglo-American courts. Many agreements, such as those founded on moral considerations, which cannot be enforced in Anglo-American law because they do not fulfil the demands of consideration, are enforceable according to the doctrines of *causa*. To one unversed in the slow compounding process of the common law it may seem strange that a rudimentary device created in an archaic system of pleading and procedure should persist as a universal test of contractual obligation. But consideration has become the mere outward form of the legal test of binding obligations. Into its categorical form have been poured the prevailing conceptions of equity and fair dealing which demand not only the legal enforcement of promises but relief against them when based upon considerations that have failed. A more inclusive generalization may replace the present conception of a mechanical exchange of units, but despite all the inroads upon it he would be a

bold man who would contend as a matter of principle that a promise could be binding in Anglo-American law without consideration.

CONSOLIDATIONS. See COMBINATIONS, INDUSTRIAL.

CONSPIRACY, CRIMINAL. The doctrine of criminal conspiracy in English law arose out of the efforts of early reformers to correct the abuses of ancient criminal procedure. Originally criminal accusations were brought by way of presentment before the king's justices or by an "appeal" which usually resulted in trial by battle. To correct the current abuses of the day, such as the malicious bringing of false presentments or causing children too young to fight to bring the appeal, statutes were enacted during the reign of Edward I (see particularly the third Ordinance of Conspirators, 33 Edw. 1, passed in 1305) making it an offense to conspire to bring a false and malicious presentment or to procure the bringing of a false appeal. During the course of the next two or three centuries the Writ of Conspiracy was strictly confined within these narrow limits; it did not cover combinations generally to oppress or injure and it required proof of an actual legal acquittal on the false charge. During the seventeenth century, when the courts began to liberalize and reshape the rigid, formal law of earlier times, it was decided in the *Poulterer's Case* (9 Coke 55b) in 1611 that the gist of conspiracy lay in the conspiring, and

that therefore a malicious combination to procure a false indictment could be punished by imprisonment even though because of the evident falsity of the charge the jury had refused to bring in an indictment and therefore no legal acquittal could be shown. Next, the offense was broadened beyond the procuring of false indictments; courts began to use the doctrine to secure convictions for conspiracies to cheat or to extort money, since the seventeenth century law of cheats was so imperfect that often convictions for barefaced fraud could not otherwise be had. This process of analogical extension was still further continued during the eighteenth century; judges found little difficulty in punishing for conspiracy those combining to commit any crime, and some went so far as to suggest (but not actually to decide) that combinations wrongfully to prejudice another or even those against public morals should be held similarly punishable. When in later years courts receded from some of these more extravagant pretensions, the precise nature of the crime remained so vague that even today no one can say whether the offense is confined strictly to combinations to commit some criminal offense or to defraud or is broad enough to cover combinations of a generally oppressive nature.

Such a doctrine was bound to have important economic effects, for its very vagueness would enable judges to punish by criminal process such concerted action by economic groups as seemed to them socially oppressive or undesirable but which perhaps could not be shown to violate any specific provision of the criminal law. In England ever since the Ordinance of Labourers of 1349 repeated efforts had been made to suppress by law attempts of working men to increase their wages beyond the accustomed level. In 1721 in the case of *Rex v. Journeymen Taylors of Cambridge* (8 Modern 10) a combination of journeymen tailors to raise their wages was held to constitute a criminal conspiracy, the court asserting that "... a conspiracy of any kind is illegal although the matter about which they conspired might have been lawful for them, or any of them to do, if they had not conspired to do it." Again, it was this doctrine which lent force to the administration of the English Combination Act of 1800 making it a criminal offense for workmen to "enter into any combination to obtain an advance of wages or to lessen or alter the hours or duration of the time of working. . . ." In the words of Dicey, "behind the Combination Act—and this is a matter

of primary importance—there stood the law of conspiracy" (*Lectures on the Relation between Law and Opinion in England*, 2nd ed. London 1914, p. 96-97). Speaking of the ensuing period the Webbs say: "During the whole epoch of repression, whilst thousands of journeymen suffered for the crime of combination, there is no case on record in which an employer was punished for the same offense" (*History of Trade Unionism*, 2nd ed. London 1920, p. 73). Under the vague doctrine of criminal conspiracy the economic and social bias and unconscious prejudices of judges (who were reared generally among the employing classes) could so easily be translated into one-sided decisions in a field of law where the pressure from social groups was unyielding that Parliament was finally led to pass the Act of 1875, providing that "an agreement or combination by two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy if such act committed by one person would not be punishable as a crime." Although under general English law the doctrine of criminal conspiracy still continues to play a part of importance, in that portion of the economic sphere where it was subject to the greatest abuse the Act of 1875 covering trade disputes ended its career.

In the United States the English doctrine was taken over with other common law principles and took firm root. In the earliest recorded American case (*Case of the Philadelphia cordwainers*, in *Documentary History of American Industrial Society*, ed. by J. R. Commons, U. B. Phillips, E. A. Gilmore, H. L. Sumner and J. B. Andrews, 11 vols., Cleveland 1910-11, vol. iii, p. 59-248; Sayre, F. B., *A Selection of Cases . . . on Labor Law*, Cambridge, Mass. 1923, p. 99-102) on the legality of trade union action, decided in 1806, certain journeymen cordwainers, indicted in Philadelphia for conspiring to raise wages, were convicted and punished; and the court, following the English decision of *Rex v. Journeymen Taylors of Cambridge*, asserted that a combination of workmen to raise wages constituted a criminal conspiracy. In the case of *Commonwealth v. Carlisle* (Brightly, Pa., 36), decided also in Pennsylvania in 1821, in which journeymen cordwainers sought to apply the same doctrine against their employers' combining to depress wages, the court held that "a combination to resist oppression, not merely supposed but real, would be perfectly innocent; for

where the act to be done and the means of accomplishing it are lawful, and the object to be attained is meritorious, combination is not conspiracy." The court held that the defendants were not guilty unless they could be proved to have been "actuated by an improper motive." Long before the middle of the nineteenth century, however, courts had abandoned the notion that a combination of workmen to raise wages constitutes a criminal conspiracy; as early as 1842 a Massachusetts court (*Commonwealth v. Hunt*, 4 Metcalf 111) declared that workmen who combined to prevent their employer from engaging anyone not belonging to their association were not criminals. Yet it was always open to reactionary courts, and still is, by this important doctrine to brand as criminal those combining to pursue conduct admittedly not criminal but regarded by the court as socially injurious or oppressive. Thus a New Jersey Court (*State v. Donaldson et al.*, 32 N. J. L. 151), in spite of the contrary decisions of other states, convicted workmen for striking to compel their employer to discharge certain fellow employees and stated that "... this indictment sufficiently shows that the force of the confederates was brought to bear upon their employer for the purpose of oppression and mischief, and that this amounts to a conspiracy." With the growth during the nineteenth century of large and strong combinations and class conscious groups pitted one against the other the doctrine has assumed increasing importance; and, since American states have not copied the English legislation of 1875, it still remains a threat to dissident groups.

If, as some courts hold, the crime is to be confined strictly to combinations to effect some object criminal in itself or to seek a lawful end by criminal means or to defraud another, the doctrine rests on sound foundations of social justice; but if, as other courts hold, combinations for some non-criminal but illegal or immoral or merely oppressive object are to be held criminal, no one acting in concert can tell in advance whether or not his contemplated conduct constitutes a criminal offense.

However, since the injunction has come to be extensively used in America and since the federal Sherman Antitrust Law of 1890 and the various state enactments of similar tenor have been passed, the doctrine of criminal conspiracy has been eclipsed in importance in the field of industrial controversy by these other remedies. The injunctive remedy without a jury is much speedier than the criminal process; and the

Sherman law, which prohibits combinations and conspiracies in restraint of trade, affords by the vagueness of the expression "restraint of trade" as flexible a doctrine as criminal conspiracy and a much readier and less cumbrous form of proceeding.

Yet in other fields of law the doctrine continues to be of large importance. Increasing use is made of it in federal prosecutions. In the federal courts, however, the doctrine has been fixed within precise limits by the United States Criminal Code, which provides in Section 37 that "if two or more persons conspire either to commit any offense (i.e. a crime) against the United States or to defraud the United States in any manner or for any purpose, and one or more of such parties do any act to effect the object of the conspiracy, each of the parties" shall be punishable for the crime of conspiracy.

This concept of the crime of conspiracy as a combination to commit definite criminal acts is one that may be said also to be generally applicable in the modern criminal codes of the continent. In some the concept of conspiracy is extended to all crimes generally; in others, only with respect to certain specified crimes.

CONSPIRACY, POLITICAL. Political conspiracy may be defined generally as a secret combination of persons for the purpose of changing the form or personnel of government by violence or other unconstitutional means. Essentially then it is the agency by which most assassinations, coups d'état and revolutions are brought into being. It shades off indistinguishably into various closely related activities: semi-secret revolutionary political action, such as Fascist or Communist, where ultimate ends are open but immediate activities more or less secret; joint economic action on a large scale, like the general strike; and murder with political aspects, like that of Rathenau.

The practise of conspiracy was common in the ancient world. A papyrus of about 1200 B.C.

records a plot against Ramses III. Greek, Roman and Hebrew history contain many examples of its use, which has continued down through the ages. Since the World War a large part of the world seems entangled in a welter of conspiracies, actual and alleged. Fascist and anti-Fascist, Communist and capitalist, republican and monarchist, dictator and democrat, face each other in various countries, the "outs" plotting the seizure of power, the "ins" seeking to detect and frustrate such plans.

If we except the period after the World War, however, it would seem that conspiracy is less important in the modern world than it has been in the past. It is essentially a phenomenon of repressive absolutist government, where freedom of speech and open differences of opinion are impossible. The rise of democracy has permitted the open accomplishment of most of what conspiracy must achieve secretly. Thus the Russian Nihilists who plotted the death of Alexander II in 1881 protested against the assassination of President Garfield in the same year as being out of place in free America. The almost universal reversion to conspiracy in the post-war period is to be attributed in large part to the reaction from democracy which has characterized that period. The dictatorially governed countries of Europe, like the pseudo-democracies of Latin America, force normal parliamentary oppositions into conspiracies. Similarly, in an otherwise true democracy particular groups may be denied the right of free speech and be compelled to plan and act secretly, thus laying themselves open, if discovered, to further and more violent attacks by their opponents. The treatment of syndicalists and communists in America during and after the war illustrates the principle.

Free speech, however, is no guaranty against conspiracy, especially in periods immediately following revolutions or other upheavals. Young republics face constant danger from two sources — royalists seeking restoration of the monarchy, radicals seeking further change. Post-revolutionary France had its Bourbon and Babeuf conspiracies, post-revolutionary Germany its Kappist and Hitlerite *Putsches*, its Spartacist and Communist plots. As allegiance to the new dynasty or the new form of government grows, the danger from conspiracy diminishes. The popular allegiance to the senate in republican Rome reduced considerably the chance of successful conspiracy, whereas the decline in the power of the senate and the rise of that of the

army, with its purely personal, often mercenary, allegiance, made assassinations and usurpations the rule. Divine sanction, popularly accepted, gave the Davidic dynasty in Judah a stability not enjoyed by the dynasties of Israel based upon the shifting sands of personal ability. In post-war Germany dynastic loyalty clashes with patriotism and constitutionalism, with results which vary in different sections of the country. The personal popularity of the Wittelsbach family is probably an important factor in the tendency of Bavaria to persist as the hotbed of monarchist conspiracy in Germany.

Along with the decline in the use of conspiracy democracy has brought a decline in assassination resulting from conspiracy. The change is an indication of the waning importance of the individual in political life. In a despotic monarchy conspiracies tend to involve assassination — almost uniformly where personal usurpation of power results, frequently where revolution is the aim. Machiavelli recognized that the monarch and his children must be disposed of, for they stand as perpetual threats to the permanence of the change. In democracies no single person stands in the way so definitely that he must be eliminated.

The immediate function of conspiracy is to achieve united and well timed action by a group in the face of opposition and persecution by the government. Secrecy is therefore essential. But some communication is required to secure coordination and cooperation. The larger the group, the greater the problem becomes. Meetings of large groups tend to arouse suspicion; hence the number is kept as small as is compatible with possible success or, as in the case of Caesar, the eighty conspirators never hold general meetings but communicate through social visits to one another's houses. Each person added increases the chance of treachery from within as well as of observation from without. Actual or potential sympathy is therefore an essential prerequisite to initiation into the secret. Bakunin, perennial conspirator, established a hierarchical conspiracy, the lower groups being ignorant of the aims and very existence of the groups above them. The mere good faith of the spoken word may be supplemented by some solemn rite, such as the alleged drinking of a cup of wine mixed with blood by the Catilinarian conspirators or the Holy Communion, which, it is charged, sealed the Gunpowder Plot of 1605. Or some outrage may be committed by all to make each person subject to some severe

criminal penalty. Such was probably the purpose of the assassination of Hyperbolus by the oligarchic conspirators of 411 B.C.

Preexisting organizations not in themselves conspiracies may be seized upon by individuals as nuclei for plots. So close was the relationship between the political clubs of Athens and political conspiracies that the same word described both institutions. Permanent secret societies—masonic lodges, the Carbonari, the Jesuit order—have often been utilized in this way. Once started such plots may spread through an order, bringing in new chapters which are interested only in the newly acquired political aims. They may even spread to other countries, as did the Carbonari movement to southern France.

International contacts may play a more active part in conspiracies than that of mere conscious or unconscious imitation. Individual conspirators, like Bakunin and Major Waldemar Pahst, may plot successively, if unsuccessfully, in several countries. Foreign diplomats may encourage conspiracies, as the Englishman Merry in the Burr case, or may even engage in them actively, as the Spaniard Bedmar in Venice in 1618 and the Englishman Wickham in the Pichegru case in 1795. England sent Cadoudal to France with English funds to foment an uprising in Paris in 1803; Germany sent Casement to Ireland in a submarine in 1916 accompanied by a shipload of arms for the use of Irish rebels. Open aid may not be forthcoming, but émigrés may be sheltered while they hatch conspiracies against their native country. In this way even the traditionally neutral nations, such as Switzerland and Holland, become unwilling nests of conspirators.

Once under way the conspiracy faces a number of problems. Arms must be secured, loyalties maintained. For these and other purposes funds are needed. Monarchist plots may frequently receive sufficient funds from the royal family itself, its followers and those who stand to gain through the restoration of confiscated estates or the payment of repudiated debts. Other conspiracies may find the problem somewhat more difficult. In this connection the United States has often played an important part through its great wealth and the willingness of its immigrants to finance various types of political endeavors in their home country. The proper time for striking the first blow must be determined—usually when the king is away, the country at war, suffering widespread or unrest

and discontent manifest. The particular place is also important. Caesar was assassinated in the senate to give the act a political air. Control of Rome ordinarily carried with it control of the empire; the capture of Washington would mean little in a conspiracy in America. After activity begins some attempt must be made to gain the sympathy of the people, the ultimate authority in many cases. Brutus harangued them about liberty and tyranny; Lenin and Trotsky in 1917 offered them an end to war, land for the peasants and factory control for the workers.

The motives of conspirators vary not only with the individual plot but with the individual actors. The devotion of the Jesuits to their church, the patriotic nationalism of the Fenians, the constitutionalism of the Nihilists and the Carbonari, are fairly self-evident and consistent motives. But the fanatical patriotism of Brutus, gladly sacrificing a friend to the liberty of Rome, may be linked with the class loyalty and individual jealousies and ambitions of the other conspirators. Financial gain is of course a factor of considerable influence, while the desire for power for its own sake plays a very important part, especially in conspiracies centering about a royal court. For in this environment in which all value is measured in terms of individual power and authority, in which no other outlet for talent and ambition is provided, the man without power seeks to gain it, the man deprived of it to regain it. Constable Bourbon seeks to regain his lost lands and military authority by plotting an invasion of France by Charles V and Henry VIII. The hand of a fair lady, presumably bringing with her land and power, forms part of the promised reward in his case, as in that of other conspirators. Royalty deprived of a throne feels called upon by divine command and the habit of power as well as by the insistence of its followers to risk fortune, freedom and life in an attempt to regain power. Honor permits no other course to a dethroned king and his family. They may even find themselves, like the Duc d'Enghien, pushed forward as aspirants for a crown they do not seek in a conspiracy of whose very existence they may be ignorant. Marx's dictatorship of the proletariat to follow the social revolution was not without foundation in history and has received additional justification from the constant and determined plots against the Soviet government of Russia.

Once involved the individual conspirator may run the gamut of a series of interesting psychological stages. The nervous tension, arising

especially from the constant fear of discovery and heightened by every delay or mishap, increases as the time set for action draws closer. Brutus cannot sleep at night; his nervous fellow conspirators almost attack prematurely as Caesar engages in lengthy conversation with one who knows of the plot. Harmodius and Aristogeiton in 514 B.C. in a similar situation do act too hastily. Even action, once begun, does not bring complete relief, for success depends upon the cooperation of others. Perhaps some mishap, like Fiesco's accidental fall into the sea, will ruin all as success seems attained; perhaps the plot has been revealed and the conspirator will, like Guy Fawkes, open his cellar door not to a fellow conspirator but to a police squad.

Discovery and arrest meant almost certain death in the past, especially in an autocratic kingdom. Catiline might plot against the Roman republic and live to plot again, but conspiracies in the empire, even if only imaginary, lead to immediate death. The formality of a trial may be granted; the sentence is inevitable. More recently, especially where the rights of the individual are protected, a real trial may bring only imprisonment or perhaps acquittal because of the difficulty of obtaining sufficient evidence. But executions after star chamber proceedings still occur under the G. P. U. in Russia, and the rapidity with which alleged anti-fascist conspirators are imprisoned under lengthy sentence in Italy casts some doubt upon the reality of the justice accorded. The very prevalence of conspiracies, begotten by suppression, in turn begets increased suspicion and suppression. Censorship is tightened, secret police redouble their activities and agents provocateurs manufacture conspiracies where they do not already exist. Nervous emperors fearing assassination strike quickly without investigating too carefully; dictatorial fascism and Communism utilize all the well known machinery of oppression to stamp out revolutionary conspiracies. Thus the vicious interaction of suppression and conspiracy continues, increasing in violence and intensity.

Popular judgment upon conspiracies is essentially indicated by the unpleasant connotation of the term. The combination of secrecy and violence are generally repulsive. Hence the plotting which precedes most successful revolutions is rather quickly forgotten; at least it is seldom referred to as a conspiracy. The pragmatic justification of success lifts it out of that obnoxious category. For the same reason attempts to dis-

credit particular groups frequently take the form of charges of conspiracy. The revelations of the Gunpowder Plot and the Popish plot of 1678 were successfully used against the Catholics in England. The protocols of the Elders of Zion, the charges against Jugoslavs living in Italian territory, the perennial conspiracies charged to the experts and the conservatives in Russia, the plots attributed to the I. W. W. and the communists in the United States, are modern examples of this ancient practise.

Interesting if fanciful accounts of the problems of conspiracy are given in Anatole France's *La révolte des anges* (Paris 1914, tr. by Mrs. W. Jackson, New York 1914), and G. K. Chesterton's *The Man Who Was Thursday* (New York 1908).

CONSTABULARY. *See* POLICE.

CONSTANT DE REBECQUE, HENRI BEN-JAMIN (1767-1830), Swiss-French man of letters, political pamphleteer and parliamentarian. The vacillations of Constant's personality, as well as of his career, have tended to divert attention from his remarkably consistent political doctrines. These he had formulated even during his early political activities under the Directory and the Consulate before his exile by Napoleon; but they did not find fully rounded expression until the final period of his life, when after his return to France in 1814 he played a prominent part, both as political pamphleteer and parliamentarian, in laying the foundations of the liberal party in France.

Under the changed conditions of the Restoration government Constant continued the manifold attempts of his predecessors to fix the boundary between state sovereignty and individual rights. His phrases are reminiscent of the past but underneath his terminology there have crept in new shades of meaning. His conventional attacks on unlimited sovereignty disguise what is essentially an antipathy to the very principle of sovereignty. Sovereignty arising from direct participation of the collective body of citizens passed with the small political group of antiquity and, despite Rousseau's well meaning attempt to revive the idea of undelegated collectivity, has no practical interest in the modern state. Sovereignty as understood by Bodin or Hobbes or Bossuet was shattered by the French Revolution, which in this initial aim was entirely laudable. But the sovereignty of the people, under guise of which were perpetrated the later tyrannies of the revolution, is as dangerous a weapon as that which it replaced. Yet since state activity is inescapable under modern conditions, and in default of better sanction, this principle must be invoked as the basis of government. Having made this half hearted concession to the principle of sovereignty, Constant immediately arrayed against it a host of limitations, couched apparently in orthodox terms of natural rights. But there is strikingly absent any generous concern for the interests of the collective body called the people or even for the interests of the majority. Constant was too closely akin in temperament to the ideologues to accept unreservedly a rationalistic, eighteenth century interpretation of natural law, with its implications of equality and uniformity. There was beginning to appear, beneath his moral apostrophes, a note of calculating demand on the part of the individual citizen to be left alone in his attempts to find happiness in his own unconforming way. In the new era of industry and commerce the individual is absorbed in his work. He has no leisure to participate directly in government. In many cases he has no leisure to devote adequate thought to the selection of a representative and is therefore reconciled to discriminations in the franchise. But he will find compensation if in his daily life and work he is free from authoritarian interference. Any gain on the part of the state is a corresponding loss to the individual. That such advances should be kept at an irreducible minimum was the starting point of Constant's political program. As the fundamental safeguard he adapted the theory of

a rigid separation of powers, at the same time making a significant contribution to the technique of constitutional monarchy in his assignment to the monarch of the completely negative role of arbitrator between the four other organs. His minor bulwarks of individualism—responsibility of ministers and their agents, liberty of the press, due observance of legal forms and a system of federalism in which the local government is an independent branch of the executive power—were written large in the liberal program, while the negative implications of his doctrines were emphasized and constantly appealed to by nineteenth century liberals.

CONSTANTINE (Constantinus, Flavius Valerius) (c. 274-337), Roman emperor. Constantine was born in upper Moesia (Serbia) and was the son of the emperor Constantius I. He was saluted as Caesar by the army in Britain in 306, became Augustus in 307 and in 312 gained possession of Rome and the western half of the Roman Empire as senior Augustus. After defeating and deposing his colleague Licinius in 324 he ruled as sole emperor until his death.

The administrative reforms of Constantine were a logical outgrowth of the changes initiated by Diocletian in the interests of autocracy, bureaucracy and military efficiency. They gave to the empire the organization which it retained with no substantial changes until the seventh century. In his religious policy, however, he boldly reversed the practise of his predecessors. By the so-called Edict of Milan in 313 he raised Christianity to equality with the public pagan cults, and by the privileges subsequently con-

ferred upon the Christian clergy he paved the way for its ultimate triumph in the Christian Roman Empire. He insisted upon unity within the church and hence was drawn into the problems of sectarian strife involving the Donatists and the Arians. In this sphere he undertook to uphold the opinion of the majority of the bishops and exercised the right to summon and preside over councils and to validate and enforce their decisions, as in the cases of the councils of Arles and Nicaea. This exercise of imperial authority in religious controversies was the initial step in the development of Justinian's Caesaro-papism.

By founding Constantinople as a Christian city to be the new capital of the empire (326) Constantine did much to foster the rise of the Byzantine state with its remarkable fusion of Greek, Roman and Christian cultures.

CONSTITUENCY is the term applied to each unit or district represented in a legislative body. With the growth of modern democracy a constituency has come to embrace a distinct geographical area, but in the earlier stages of representative government it was usual to establish legislative bodies upon the basis of distinct classes or estates. The nobility, the clergy and the commons were often represented in separate bodies. The extent of the commons to be represented compelled districting for convenience, and the geographical district provided a solution of the problem. But the older system of class representation has furnished the starting point of modern theories of functional representation which look toward social or occupational groups as the basic units.

The requirement that "knights of the shire and citizens and burgesses should be dwelling and resident" within the constituencies they represented, although adopted in England in the reign of Henry v, was never enforced and in 1774 laws relating to the residence of persons elected to Parliament were repealed. In the American colonies the development was the reverse. In Massachusetts, by act of the assembly in 1693, it was directed that representa-

tives must reside in the towns for which they were chosen. This practise was followed generally throughout the colonies. By 1776 the idea generally prevailed that no man in any colony, regardless of wealth or attainments, could so efficiently serve in the colonial legislature for a given district as one who lived within that district. It was this notion which led the framers of the Constitution of the United States to require that senators and representatives shall be inhabitants of the state in which they are chosen.

Formerly representatives in legislative bodies were controlled by instructions from their constituents. This practise, in vogue in England as late as the seventeenth century, was brought to America. In Massachusetts deputies were sent from towns to the general courts with instructions governing their conduct in that assembly and on their return they were required to report on the business transacted. From New England the practise of voting instructions spread to the other colonies. In the southern colonies instructions were not voted until after 1765, although the right of petition was granted and freely exercised from a much earlier date.

Meanwhile in England a new theory of representation arose which was inconsistent with the practise of instructions. Beginning in the *Discourses concerning Government* of Algernon Sidney (London 1698) and culminating in the speech of Edmund Burke to the electors of Bristol in 1774 (*Works*, vol. ii, Boston 1865, p. 89-98) the idea developed that after the representatives had been returned and had taken their seats in the House of Commons they ought not any longer to have a dependence upon those they represented. "As members of this House," Sir William Yonge told his colleagues in 1734, "they ought to drop not only their dependence upon, but even their concern for the particular city they represent, in order to concur with the rest of the members of this House in what they judge to be for the general interest of the nation" (Cobbett's *Parliamentary History of England*, vol. ix, London 1811, p. 451). Instructions to members of Parliament by the electors were barred on the ground that they would hamper representatives in the discharge of their lawful duties and by restricting the freedom of parliamentary debate hinder their legislating for the good of the whole community.

The idea of a restricted mandate was not applied to the members of the United States House of Representatives. These men were not to be simply the delegates of the people; for the

purposes of government they were to be the people themselves. They were to be guided by "the deliberate sense of the community," but this was not to require "an unqualified complaisance to every sudden breeze of passion, or to every transient impulse which the people may receive from the arts of men, who flatter their prejudices to betray their interests" (*The Federalist*, ed. by H. C. Lodge, New York 1888, p. 446). But senators were deemed to be "in the quality of ambassadors of the states" (Elliot, J., *Debates on the Federal Constitution*, vol. II, 2nd ed. Philadelphia 1881, p. 46). It was therefore considered entirely appropriate that they should receive instructions from the state legislatures which elected them. At the outset the state legislatures instructed their senators very freely, in some cases demanding the resignation of those who refused compliance. It was not until the Whig party, which opposed the "doctrine of instructions," came into power that the practise fell into disuse.

The rise of the party system substituted another means of control. Representatives today so definitely owe their places to the party organization that an intermediate agency stands between them and the electorate. Faithful service to the party is necessary to continuance in public office, but the obligation is primarily to the local party organization. The party exercises control over the representative supposedly in the interest of its members, but however successfully the control is exercised in the interest of the constituency it is the party, not the constituency as such, which must assume responsibility for the public conduct of the representative.

The success of English speaking peoples in operating the institutions of representative government has led to the extension of the system in many countries. But thereby variations in the theory and practise of representative government have arisen. In Latin American countries the representation in the legislative body is as a rule of a general rather than a local character, and party organizations based upon religious or economic differences struggle for control of the government. The same observation may be made of representative government in many of the countries of continental Europe. The experience of Great Britain in extending representative government to India is more or less indicative of the course of development in many parts of the world. In India votes seem to depend very little upon questions of policy but almost entirely on religion, caste, local pressure

or personal grounds. The voter does not seem to have asserted any hold upon his representative, nor do the elected legislators feel that they owe him allegiance. In short, the mandate from the constituency does not exist.

CONSTITUTIONAL CONVENTIONS. The term constitutional convention designates a representative body chosen for the purpose of considering and either adopting or proposing a new constitution or changes in an existing constitution. As an integral part of governmental structure the constitutional convention is characteristically an American institution. But conventions or constituent assemblies were used during the French revolutionary period and have been used in other countries as well to frame constitutions when older institutions have been entirely superseded by revolution or otherwise. Constituent assemblies were employed for the framing of many of the post-war constitutions of Europe. The Argentine constitution provides for revision through a constitutional convention, and some other constitutions provide for similar devices. Some of the elements of a constitutional convention are found in the French National Assembly composed of the two houses meeting together for the purpose of revising the constitutional laws, but the members of the French Senate and Chamber of Deputies are not chosen especially for this purpose.

The constitutional convention had its origin in the American Revolution. Provincial assemblies had been in most of the colonies subject to prorogation or adjournment by royal governors. They were in the early days of the revolution largely replaced by provincial congresses or conventions. These, when it became

necessary to set up new forms of government, were called upon to take action. Since the theory of social contract lay at the foundation of the political philosophy of the American Revolution, it was natural that in framing new constitutions some application should be made of the principle that government rests upon compact. During the period of the making of state constitutions in 1776 and 1777 no special conventions were assembled or could conveniently have been assembled solely for the purpose of framing constitutions, but in at least eight states the existing congresses or conventions which framed constitutions were expressly authorized by the voters to take such action, and in several states new elections of delegates were held primarily for the purpose of obtaining such authorization. The first constitutions of Virginia, South Carolina and New Jersey were framed by bodies without explicit authorization by the voters, and some of the members protested against such action in Virginia and South Carolina.

The theory of the social contract may also have been responsible for the prevalent feeling that no constitution should be put into effect until it had been approved by the people. Objection was made to the New Hampshire constitution of 1776 because it was not submitted to the people, and resolutions of local bodies sought to obtain such submission in North Carolina in 1776 and New York in 1777. Informal submissions were made in Maryland, Pennsylvania and North Carolina in 1776 and in South Carolina in 1778. The proposed Massachusetts constitution of 1778 was the first instrument of government framed by a legislative body authorized to take such action and formally submitted to a vote of the people. New Hampshire took the further step in 1778 of assembling a convention for the sole purpose of framing and submitting a constitution. In the framing of the Massachusetts constitution of 1780 were first combined all the steps now common in the use of state constitutional conventions: the submission to popular vote of the question of calling a convention for the sole purpose of framing a constitution, the popular election of members to compose the convention, the submission of the constitution to popular vote.

By 1784 the constitutional convention was firmly established as a body distinct from the legislature. The constitutions of Pennsylvania (1776), Vermont (1777), Massachusetts (1780)

and New Hampshire (1784) provided for the future use of conventions. With few exceptions state constitutions have since 1784 been framed or adopted by constitutional conventions. Although twelve state constitutions now contain no provision for the assembling of constitutional conventions, the propriety of calling them is recognized in all states except Rhode Island, where a proposed new constitution, drafted by a convention under legislative authority, was rejected in 1898 and 1899. An effort of the Indiana legislature in 1911 to propose a new constitution was enjoined by the courts [*Ellingham v. Dye*, 178 Ind. 336 (1912)], but a substantially complete revision of the Virginia constitution was made by legislative proposal of amendment and approved by popular vote in 1928. In New Hampshire the constitution can be amended only as a result of proposals by a constitutional convention.

The Constitution of the United States was framed by an especially assembled convention and provides for amendment through the use of conventions, but this plan has never been used or seriously considered since 1787; instead the amendments have been proposed by the two houses of Congress and ratified by the state legislatures.

More than two hundred constitutional conventions have been held in the states or in territories seeking admission to the union, but not all of these conventions have framed constitutions. The more successful recent practise has been for conventions not to submit complete revisions of constitutions but to limit themselves to the proposal of amendments to the existing state constitution, as was done in Ohio in 1912, in Massachusetts in 1917-19 and in Nebraska in 1920. The convention when so used performs the same service as does the state legislature in proposing amendments but has the advantage of limiting itself to the one task of considering proposed changes in the state constitution.

Most of the state constitutions require that the question of calling a constitutional convention be submitted to popular vote; some require that it be submitted at regular intervals—New York, for example, requires submission every twenty years, New Hampshire every seven years. Where constitutions do not require a popular vote on the question or contain no provisions whatever regarding conventions, it may generally be assumed that the legislature has power to call a convention without popular

vote; the Indiana Supreme Court, however, in 1917 (*Bennett v. Jackson*, 186 Ind. 533, 539) held that a popular vote was necessary even though the constitution contains no provision whatever regarding a convention.

The constitutional convention as developed in the American states is a unicameral body composed of delegates elected by popular vote. The members are ordinarily elected from the districts employed for the election of members to the legislature. If, therefore, the constitutional defect to be cured is one of underrepresentation of any group in the state legislature, the convention is not an effective instrumentality, because like the legislature it will reflect the interests of the groups that are overrepresented.

Once a convention is authorized and assembled, its procedure is largely determined by the fact that it is a unicameral body convened for one specific purpose. In order to perform its functions adequately it must have control over its membership and power to determine its procedure and to elect its officers. Its committee organization must largely be determined by the specific purposes for which it is assembled. If the purpose is merely that of proposing a few amendments to an existing constitution, as has several times been the case in New Hampshire, the procedure naturally differs from that in a convention which is convened to draft a new constitution or to submit a complete revision of an existing constitution.

The federal convention of 1787 sought to reach agreement upon matters of general principle by sitting in committee of the whole. A committee of detail was then appointed and later a committee on such parts of the constitution as had been postponed or had not been acted upon. Ultimately the plan was referred to a committee on style and arrangement, which drafted the constitution in what was practically its final form. In a number of the earlier state conventions a small committee was appointed with power to prepare and report the draft of a constitution to the full convention. This method was adopted by the revolutionary conventions of Maryland, Virginia, New Jersey and Pennsylvania in 1776 and by those of New York and Vermont in 1777; all these conventions were assembled not only to frame constitutions but also to conduct the state government in time of war. A special committee to frame the constitution was also used in the Massachusetts convention of 1779-80. The plans em-

ployed in framing these earlier constitutions gave greater opportunity for the dominating influence of one man. Thus the Pennsylvania constitution of 1776 largely reflected the views of Benjamin Franklin, and the influence of John Adams appeared dominantly in the Massachusetts constitution of 1780. The more common and more recent practise of conventions has been to appoint a number of committees and to assign to each the consideration of proposals involving a particular subject. Usually there is also a committee on style, or on arrangement and phraseology, whose function it is to harmonize the various proposals approved by the convention and to draft the proposed constitutional changes in form for final approval by the convention.

Of the state constitutions adopted before 1785 only those of Massachusetts (1780) and New Hampshire (1784) were formally submitted for popular vote. From the revolutionary period to 1829 constitutions were occasionally so submitted. The second Virginia constitution was submitted in 1829, and from this time until 1860 submission was the prevailing although not uniform practise. During the Civil War period submission became the exception rather than the rule in the southern states. From the Civil War until 1890 constitutional conventions almost uniformly submitted their work to popular vote, and, while such submission has been the more common practise, since 1890 constitutions were put into effect without popular vote in Mississippi (1890), South Carolina (1895), Delaware (1897), Virginia (1902) and Louisiana (1898, 1913, 1921). Of the thirty-six state constitutions which explicitly provide for constitutional conventions nineteen require that constitutional changes framed by such conventions be submitted to the people.

In the state constitutional system the convention has become a recognized organ for the revision of the state's fundamental law. A constitutional convention when assembled in no way supersedes the organs of the existing state government and does not take over the ordinary functions of state government. Its function of adopting or proposing constitutional change is in a sense legislative but is limited by the purpose for which the convention is assembled. Conflicts between a convention and the state legislature have infrequently occurred, but occasionally legislatures in acts providing for conventions have sought to limit the powers of the convention. Judicial expressions in sup-

port of legislative power to impose such limitations are found in Pennsylvania and Louisiana; the sounder view, however, seems to be that expressed by the judiciary committee of the New York convention of 1894: "It is of the greatest importance that a body chosen by the people of this state to revise the organic law of the state, should be as free from interference from the several departments of governments as the legislative, executive, and judiciary are, from interference by each other. Unless this were so, the will of the people might easily be nullified by the existing judiciary or legislature. Should the latter attempt to enact a law prohibiting the constitutional convention from restricting the existing power of the legislature, the act would be at once recognized as an unwarranted invasion of the rights of the people" (*Revised Record of the Constitutional Convention of 1894*, vol. i, Albany 1900, p. 250).

While not altogether free from partisan influences constitutional conventions have ordinarily been less partisan than legislatures, and in some states the members have been elected on a non-partisan ticket. They have ordinarily, however, been content to follow rather than to lead, and since the revolutionary period and the framing of the national constitution little of constructive statesmanship has developed in such conventions. They have imposed limitations upon legislative authority in order to prevent the continuance or repetition of legislative policies that have failed. They have embodied in their constitutions details of policy recognized as desirable at the time the convention itself was sitting. As organs for effective state governmental policies of a permanent character they have largely failed, although this may merely be equivalent to a statement that they have been little if at all in advance of the political intelligence of the times in which they have acted. While conventions have been useful in the periodic reexamination and revision of state constitutions there is little evidence that on the whole their work has been superior to the constitutional changes proposed by the legislative bodies and adopted by popular vote.

CONSTITUTIONAL LAW. There are three types of constitutional law: the English type, characterized by the absence of a written constitution, the continental type, where there is a written constitution which is not judicially enforced; and the American type, where the written constitution is given effect by the judicial power to declare laws unconstitutional.

In Great Britain the constitution is the sum of principles which are observed in the exercise of the powers of government and which are embodied in acts of Parliament or other declarations or in unwritten traditions and understandings. But both the law and the custom of the constitution, having no higher formal sanction than ordinary statutes or the common law, yield to any act that Parliament may pass, however contrary to accepted and fundamental principles of government. A statute is thus legally superior to the constitution. In consequence constitutional law of this type cannot be clearly distinguished from other public law, and a treatise like Sir William Anson's on the *Law and Custom of the Constitution* (1886-92) may legitimately cover the entire range of written and unwritten law which the author regards as essential to the functioning of government.

Where the constitution forms a distinct legal instrument, as it does in most modern countries, proclaiming itself by its designation as a fundamental and paramount act, the scope of that instrument also determines the scope of constitutional law. As fundamental and paramount law the written constitution has legal validity and authority, although its only sanctions may be a promissory oath and political responsibility. The practise of continental jurists has always recognized constitutional law as one of the legal disciplines, irrespective of whether it can become matter of judicial cognizance.

This paramount authority of the constitution is greatly aided if the method of framing or amending it is such as to set it apart clearly from ordinary legislation, while it is correspondingly weakened if the constitution can be amended by an act of legislation formally indistinguishable from the enactment of other statutes, with the simple addition of observing certain safeguards in the enactment of the constitution amending legislation. Thus in Germany the constitution of 1919 is amendable by legislation in which a two-thirds majority of the Reichstag concurs, and if it is apprehended that an important statute may raise a constitutional question the practise has been introduced of reciting in the enacting clause of the statute that it has been passed by a majority sufficient to satisfy a constitutional amendment. This produces a formal confusion between constitutional and ordinary law.

The distinctive character of the constitution and of constitutional law becomes most pronounced if the violation of constitutional provisions can be made the ground of a judicial contest, and particularly where a successful contest may result in the nullification of legislative acts. The judicial power to declare laws unconstitutional may be a logical consequence of a federal constitution. If such a constitution assigns to federal laws a status superior to state laws and gives to courts jurisdiction to enforce federal laws, it follows that the legislative act of a member state cannot be given judicial effect as against conflicting provisions of federal statutes; and under the German federal constitution of 1871 the judicial power to declare state laws invalid in this respect has always been acknowledged by German jurists, the relation between federal and state laws being analogous to the relation between a statute and a municipal ordinance or between a statute and an administrative regulation. The federal constitution will have the same paramount force as a federal statute.

Under the constitution of a unitary state or of a federated member state, which limits legislative powers, the title of the courts to an enforcing authority by way of nullification of statutes is as a matter of theoretical jurisprudence controversial. In opposition to the power it may be argued that a constitution, even if its mandates are intended as checks having the character of law, addresses itself to the political organs of the state; and that the reliance upon a politically operative sanction expresses itself in the manner of phrasing its provisions, many of the clauses being so generally worded as to be more appro-

priate for legislative elaboration than for the application of judicial rules of construction. The classical American exposition of this view is to be found in the opinion of Chief Justice Gibson of Pennsylvania in the case of *Eakin v. Raub* [12 S. and R. 330, 348 (1825)], in which it is pointed out that "the constitution, then, contains no practical rules for the administration of distributive justice, which alone concerns the judiciary; and that these rules are furnished in acts of ordinary legislation . . ." Even where constitutional provisions are legally phrased, it may be claimed that under a theory of coordination of the three departments of government the action of the legislature, which must interpret in order to legislate and which is called upon to act first in order of time, is entitled to respect on the part of the courts, just as the courts assume that the executive in enforcing their judgments will respect their interpretation. The argument in favor of the finality of legislative interpretation has in the past generally prevailed with foreign jurists, and this view has found express recognition in the Prussian constitution of 1850 (article 106) and in the Swiss constitution of 1874 (article 113).

The argument in favor of an overriding judicial power of interpretation has found expression in Chief Justice Marshall's opinion in the case of *Marbury v. Madison* [5 U. S. 137, 176-180 (1803)], and American lawyers have generally accepted it as valid and final. It is particularly noteworthy that Chief Justice Gibson toward the close of his judicial career, "from experience of the necessity of the case," recanted the opinion expressed twenty years before in *Eakin v. Raub* [Norris v. Clymer, 2 Pa. St. 277 (1845)]. Inevitably the controversy was settled not on the basis of logic but as a matter of historical development and of popular acquiescence. During the colonial period the way had been prepared by theories of popular sovereignty, of natural rights, of paramount laws and of limited legislative powers; and the recognition of the judicial power expresses a profound and universal conviction that the function of interpretation can be most safely entrusted to courts of justice and constitutes, as it were, a judicial monopoly.

Once established, the judicial power to declare laws unconstitutional dominates constitutional law as a branch of jurisprudence. Treatises on constitutional law are devoted mainly to the analysis of judicial decisions, and the professional and academic study of constitutional law is the study of case law. Congress itself dis-

cusses its powers almost entirely on the basis of judicial decisions and is in danger of losing a sense of independent responsibility; because the Supreme Court feels compelled to give effect to a statute which violates a treaty, we find Senator Lodge declaring that "the right of Congress to abrogate a treaty directly or indirectly by statute is unquestioned and has been sustained by the Supreme Court" (*Congressional Record*, vol. Ixi, 1921, pt. i, p. 836).

Under the dominance of case law constitutional relations with which the courts are not likely to deal assume a secondary place in legal treatment. Such matters as the difference between presidential and parliamentary forms of government are in any event rather political than legal; but even where legal provisions control or at least enter into constitutional relations, the issues are not likely to be thoroughly ventilated until they become matter of judicial controversy. The presidential power of removing officers was incorporated into constitutional law only by the decision in the Myers case [272 U. S. 52 (1926)], rendered long after the power had been practically conceded by the legislative repeal of the Tenure of Office acts; for the issue made by President Wilson in connection with the national budget bill in 1920 was quickly dropped by President Harding.

Perhaps it has been a factor in making it possible for the judicial character of American constitutional law to establish itself that, generally speaking, politically controverted issues were kept out of court with the conspicuous exception of the Dred Scott Case; and this again was possible because there were—apart from the right of secession—no greatly controverted political issues; had there been anything in the United States like the protracted struggle between legislature and executive that has recently been witnessed in the Philippines, we might have come to realize the limits of the capacity of the courts to determine vital constitutional issues.

The habit of judicial scrutiny has, however, also enlarged the province of constitutional law. On the one hand, increasingly legalistic phrasing of constitutional provisions has led to increasingly legalistic interpretation; on the other hand, the courts have become astute in discovering limitations of legislative power on the basis of general clauses and principles.

The growth in length of American state constitutions has often been commented on. If the direction of the growth is analyzed it will be

found that the fundamental guaranties of private rights have remained almost stationary; that while there has been some attempt at fixing social and economic policies in the constitution the movement has not been sustained; and that on the whole the increase in bulk has been due to detail of organization. In some cases the policy of constitutional fixation is obviously due to distrust of the legislature, as in the apportionment of representative districts in the constitution of the state of New York, which leaves nothing to further legislative action; but in most cases the practise serves no intelligible purpose beyond gratifying the desire of the constitution makers to perpetuate arrangements which they consider wise.

The more elaborate the constitutional organization, the more likely it is to contain implications that are unrealized and unforeseen, and such resulting limitations may under a legalistic spirit of judicial construction seriously impede legislative and constitutional progress. The constitutional recognition of an office may lend color to claims of independence from statutory regulation [*People ex rel. Gullett et al. v. McCullough*, 254 Ill. 9 (1912); *State ex rel. University of Minnesota v. Chase*, 175 Minn. 259 (1928); *Board of Regents of the University of Michigan v. Auditor General*, 167 Mich. 444 (1911)], and the constitutional power to appoint subordinates will prevent the application of the merit system to the office until the merit system itself is written into the constitution [*People ex rel. Killen v. Angle*, 109 N. Y. 564 (1888)]. Such administrative independence from the legislature produces a species of legislative anarchy, since there is no available method of making a rule voluntarily adopted binding upon successors in office except through comity, and departure from rule or precedent has all the sanction of new law. It also involves difficulties, in the way of making the official power fully operative through appropriate sanctions, which the courts laying down the doctrine of independence have apparently not thought out.

The history of reform movements is a history of constitutional obstacles to be overcome, and in many cases the impeding provisions had in their turn been the product of reform movements. The first constitution of Illinois, adopted in 1818, would be a more serviceable instrument today than the present constitution of 1870; and the proposed but defeated constitution of 1922 would have created as many obstacles as it removed. The formal or style re-

quirements relating to the title of statutes and amending acts create constitutional problems without serving any valuable purpose. An altogether undue proportion of American constitutional law is of this technical and almost futile character. The obvious remedy of a proper restraint in the piling up of constitutional detail is a counsel of perfection; the leaders of the bar, who generally play a prominent part in constitutional conventions, apparently regard the elaborate type of instrument as politically inevitable.

The earlier type of a brief instrument is at present best represented by the Constitution of the United States, which has the double aspect of a federal compact and a fundamental law. The jurisdictional adjustments in a federal state offer a specific judicial problem which is complicated in the United States by the fact that a distribution of powers made for a relatively loose federation had to be made to fit a constantly more closely welded national union. The interpretation of the commerce clause both as a grant of power to Congress and as a limitation upon the states must be judged as a political rather than as a legal performance.

If from the point of view of constructive jurisprudence it may be contended that the undue rigidity of American as compared with other federal adjustments (resulting, for example, in the matter of divorce jurisdiction in "twilight zones" incapable of being adequately dealt with by legislation) has been added to rather than tempered by judicial construction, particularly by the theory that even the moderate exercise of state power must be denied if its possible abuse might injure national interests, this too must probably be attributed to the feeling that the benefit of any doubt should be given to the national power. However, the Supreme Court has not been consistent in this respect, and its subtle distinctions occasionally manifest serious error as well as deplorable fluctuation.

The explicit limitations upon legislative powers (as distinguished from limitations resulting from positive provisions) which we find in all American constitutions are partly specific and partly general. The specific limitations, largely the heritage of past constitutional struggles, relate to political rights and the possible abuse of governmental power through criminal legislation and the administration of justice and are of great historic and legal interest; but it is in the general limitations that we look for the essence of constitutional law. The general limitations are

associated with the concepts of due process, the equal protection of the laws and the separation of powers. Due process is enjoined by the federal constitution both upon Congress, in the Fifth Amendment, and upon the states, in the Fourteenth Amendment, so that the same guaranty by the state constitutions has become of minor importance. The equal protection of the laws is enjoined by the federal constitution upon the states; and the separation of powers is a principle both of federal and of state government, but is not enjoined by the federal constitution upon the states. Even if this separation could be said to be essential to the republican form of government, which the United States guarantees to the states, that guaranty is held to be merely political, and not judicially enforceable [*Pacific States Telephone and Telegraph Co. v. Oregon*, 223 U. S. 118 (1912)].

The equal protection of the laws was written into the Fourteenth Amendment as a result of the Civil War and was intended for the protection of the Negro race. It has prevented compulsory residential segregation of the two races but not segregation in schools or in public conveyances. Judged merely by judicial decisions its effect upon legislative race discrimination may be regarded as only moderate; but it has undoubtedly prevented the enactment of much adverse race legislation, and this "invisible" result is probably more important than that which is reflected in the action of the courts. The equal protection of the laws may also be relied upon to defeat legislative discrimination other than that based upon race. The decision of the Supreme Court that an exemption of agricultural producers invalidated an antitrust statute [*Connolly v. Union Sewer Pipe Co.*, 184 U. S. 540 (1902)] was for a long time the most advanced judicial position taken in that respect; and the authority of that decision was greatly weakened, if not destroyed, by the later almost universal adoption of a legislative policy favoring agricultural co-operation, which the Supreme Court now supports [*Liberty Warehouse Co. v. Burley Tobacco Growers Ass'n.*, 276 U. S. 71 (1928)]. More recently, however, the Supreme Court has given the principle of equality new and unexpected applications, particularly in favor of corporations in the matter of licensing requirements [*Louis K. Liggett Co. v. Baldridge*, 278 U. S. 105 (1928); *Frost v. Corporation Commission of Oklahoma*, 278 U. S. 515 (1929)] and of tax discrimination [*Schlesinger, Executors, v. Wisconsin*, 270 U. S. 230 (1926); *Intermeyer v.*

Anderson, 276 U. S. 440 (1928); *Quaker City Cab Co. v. Pennsylvania*, 277 U. S. 389 (1928)]. While these decisions are marked by strong dissents and are incapable of being reduced to consistent and easily workable rules, they serve as a warning that if the indispensable legislative power of classification is used by way of unjust discrimination it must at least be prepared to stand the test of judicial scrutiny.

The principle of the separation of powers raises problems of constitutional law in connection with the delegation of legislative power and with the independence of the judiciary. Since delegation of legislative power to some extent is inevitable and since total surrender is improbable in America, the question is entirely that of the reasonableness of the particular delegation of power. The Supreme Court, while subscribing to the principle of non-surrender, has sustained delegation where it has become a practical legislative proposition, particularly in connection with the so-called flexible tariff [*Hampton and Co. v. United States*, 276 U. S. 394 (1928)]. The integrity of the judicial power is construed by the Supreme Court to mean that a court cannot be burdened with the function of advice or inconclusive determination—a technical doctrine, the precise implications of which are not as yet ascertainable. The freedom of ordinary civil and criminal justice from executive or legislative interference is firmly established; but in connection with the exercise of administrative justice the question is to what extent administrative determinations may be made conclusive. While the jurisdiction of administrative commissions has expanded rapidly, an adequate right to judicial review has either been recognized as a matter of common law or has been accorded by statutory provision or, if necessary, has been enforced by the courts as a constitutional right.

The protection of the right to judicial review by the federal Supreme Court [*Ohio Valley Water Co. v. Ben Avon Borough*, 253 U. S. 287 (1920)] shows that it constitutes part of the guaranty of due process and not merely of the separation of powers.

Due process is the most inclusive of constitutional guaranties and its expanding application makes it almost possible to ignore more specific clauses. It may be convenient to identify with due process the entire theory of inherent limitations upon legislative power which has been produced by the more recent development of constitutional law.

Until the middle of the nineteenth century the

idea of inherent limitations in accordance with natural law theories was confined to the protection of vested rights from retrospective invasion; and there was no suggestion that freedom of individual action had an assured immunity from legislative regulation by general and prospectively operating rules, except as such immunity was incorporated in specific guaranties (freedom of speech and press, religion, etc.). After the Civil War there gradually emerged the idea that as in the administration of justice due process in the last analysis stands for just cause, so just cause is also a requirement to be observed in legislative interference with private right and means in connection with such legislation the reasonable exercise of some legitimate function of government. The first conspicuous application of this theory by the Supreme Court related to inherent limits of the taxing power, and the theory was here applied without specific reference to the due process clause [*Loan Association v. Topeka*, 87 U. S. 655 (1875)].

The impulse to the insistence upon inherent limitations was given by a conservative opposition to a growing popular conviction that unchecked capitalistic power was detrimental to public interests. The popular conviction manifested itself in measures for the control of railroads and later of trusts and for the protection of labor; the opposition centered on railroad and on labor legislation. The decisions in the so-called Granger cases of 1877 concede full power of legislative control over "business affected with a public interest" (eventually qualified by holding that regulation must not become confiscation); but Chief Justice Waite intimated that there was no power to control rights purely and exclusively private [*Munn v. Illinois*, 94 U. S. 113 (1877)]. This foreshadowed the constitutional right of freedom of contract, which became conspicuous first in connection with labor legislation and then in connection with other economic regulation.

The recognition, under the guaranty of due process on behalf of liberty and property, of a sphere of immunity from legislative regulation must, for the present at least, be regarded as part of American constitutional law. Where there are no special conditions either by reason of the nature of the business (transportation, insurance) or by reason of great public emergency [housing shortage, *Block v. Hirsh*, 256 U. S. 135 (1921)] a majority of the Supreme Court holds legislation directly or indirectly fixing prices, wages or rent to be invalid [*Adkins et al. v.*

Children's Hospital, 261 U. S. 525 (1923); *Jay Burns Baking Co. v. Bryan*, 264 U. S. 504 (1924); *Chastleton Corporation v. Sinclair*, 264 U. S. 543 (1924); *Tyson and Brother v. Banton*, 273 U. S. 418 (1927); *Fairmont Creamery Co. v. Minnesota*, 274 U. S. 1 (1927); *Ribnik v. McBride*, 277 U. S. 350 (1928)—all of these being decisions rendered in the decade between 1920 and 1930. Until recently it seemed that this protection was confined to economic liberty, but two significant decisions have applied it to the right of private education, thus supplementing, carrying forward and to some extent rendering superfluous the more specific social and political guaranties of state constitutions [*Meyer v. Nebraska*, 262 U. S. 390 (1923); *Pierce v. Society of Sisters*, 268 U. S. 510 (1925)].

Equally or more significant is the judicial enforcement, in the name of due process, of the conformity of legislation to what are conceived as essential standards of justice and general jurisprudence. It was an anomaly that the Court of Appeals of New York declared a statutory liability of an employer irrespective of fault to be in violation of due process, suggesting that if such liability was to be established specific authority should be given by the state constitution (which was subsequently done); for this proposition in effect implied that due process meant one thing in the state constitution and another thing in the federal constitution. Characteristic of the new tendency are, however, the following rulings: against the practise of having judges profit by convictions [*Tumey v. Ohio*, 273 U. S. 510 (1927)]; against the exercise of regulative power by the irresponsible consent or veto of interested owners [*Seattle Title Trust Co. v. Roberge*, 278 U. S. 116 (1928)]; against unjustifiable adverse presumptions [*Manley v. Georgia*, 279 U. S. 1 (1929)]; *Western and Atlantic Railroad Co. v. Henderson*, 279 U. S. 639 (1929)]; and against penal legislation phrased in indefinite terms [*Cline v. Frink Dairy Co.*, 274 U. S. 445 (1927)]. These decisions were rendered by a unanimous court in contrast to the division of opinion in the decisions recognizing a constitutional immunity from legislative regulation.

The two classes of decisions, the one protecting liberty and the other protecting justice, obviously represent different lines of thought. Canons of justice are reasonably permanent and universal, and if we are to recognize at all such a thing as a judicially enforceable inherent limitation upon legislative power it ought to be ap-

plied to the anomalous survival of commonly reprobated legislative practises; from this point of view it might be expected that the Supreme Court would no longer countenance a special divorce granted today by a legislature without notice to the non-consenting spouse, as it did in 1888 with reference to a divorce granted in 1852 [*Maynard v. Hill*, 125 U. S. 190 (1888)]. The judicial setting of boundaries to the police power in disregard of the fact that they are juridically undefinable is another matter. The Supreme Court operates with unclarified distinctions and decides by bare majorities; the undefined private right is always countered by an undefined public power, and the doctrine of overriding emergency will always be available for a reversal of untenable rulings. The mere mechanical expansion of public power creates an increasing dependence of private interests upon the affirmative good will of the state. When German constitutions speak of the freedom of doctrine they refer to doctrine as taught by a public system of education, and we shall have to realize that education is not free if the state can forbid the teaching of evolution in public schools—just as the freedom of the press now depends on mail privileges, as adequate freedom of expression may in the future depend upon state controlled broadcasting facilities, and just as the right to bear arms has become meaningless if the use of machine guns or of gas may be confined to public authorities. Courts must necessarily wage a losing fight if they attempt to protect a right of individual liberty against a resisting or even non-cooperating state.

If due process is to be looked upon as a permanent part of constitutional law it is not likely to be identified with an unchanging economic or social theory of individualism but rather with the observance of due standards of legislation. As regards the latter, however, while judicial censorship may occasionally correct legislative inadvertence or arbitrariness it is not greatly needed for that purpose, at least where legislative practise is guarded by respectable tradition and responsible leadership. A real conflict between legislative and judicial power is likely to be a conflict of policy and not of law. This explains why the free dominions of the British Empire have been willing and able to dispense with the due process guaranties. It also explains why post-revolutionary Germany, where legislature and judiciary to some extent represent divergent political tendencies, is witnessing a movement in the direction of using,

upon the American model, the constitutional guaranty of property for the purpose of questioning and invalidating legislative acts (Germany, Reichsgericht, *Entscheidungen des Reichsgerichts in Zivilsachen*, vol. cxi, p. 322). It makes little difference in what form a constitutional guaranty is phrased: under appropriate conditions it will serve as a weapon in the hands of the judiciary against acts of government of which the conservative sense of the community disapproves.

The judicial enforcement of American constitutional law operates through civil or criminal litigation in which the validity of legislation is merely an incidental point; a cause of action is asserted or a defense interposed upon the theory that a statute which vitally enters into the controversy is null and void. The court decides in favor of the plaintiff or the defendant, its decision being, so far as necessary, controlled by the view which it takes of the validity of the act; but there will be no formal judgment annulling the statute, as seems to be assumed by some of the propositions for requiring the concurrence of all members but one of the Supreme Court in a judgment declaring a law unconstitutional. The Supreme Court even holds that a direct action to annul an act of Congress is not an exercise of the judicial power as defined by the constitution and cannot therefore be authorized by Congress [*Muskrat v. U. S.*, 219 U. S. 346 (1911)]. Foreign constitutions provide for the submission of constitutional controversies as such to tribunals given jurisdiction for that purpose, but this practise is unknown to American constitutional law. The practise of advisory opinions in a few states, e.g. Massachusetts, is of a different character.

A court will not decide a constitutional question if the case can be disposed of without it (such at least is the theory); but since such decision is necessarily consequent to private litigation it is not always possible to avoid a politically undesirable issue. In practise this has caused no great inconvenience; the *Dred Scott* Case, which might be cited to the contrary, was one of the cases in which the Supreme Court went out of its way to decide a constitutional issue which was not necessary to the disposition of the actual controversy. Indeed, the possibility of forcing the determination of questions of public law by private initiative is one of the notable incidents of the American system of constitutional law and on the whole must be counted as a political benefit.

A constitutional provision existing for the protection of private rights may be waived by consent or failure of timely objection, the most conspicuous illustration being the waiver of trial by jury [*Patton v. United States*, 281 U. S. 276 (1930)]; but this must not be carried by the legislature to the point of requiring licenses and making a waiver of constitutional right a condition of granting the license [*Frost Trucking Co. v. Railroad Commission*, 271 U. S. 583 (1926)].

If a statute is severable those not affected by the invalid portion are not in a position to rely upon the invalidity [*New York ex rel. Hatch v. Reardon*, 204 U. S. 152, 160 (1907)]. Severability may thus become an important question. An invalid exception from a penal statute cannot well be eliminated by a court, since that would carry penalties beyond legislative intent and expression and it would therefore defeat the entire statute. If the statute includes classes of persons or conditions which cannot be constitutionally reached, a court may declare itself powerless to make a separation which the legislature may not have intended [*Trade Mark Cases*, 100 U. S. 82 (1879)]. To obviate this difficulty it is not uncommon to insert in a statute a severability clause, by which the legislature directs the application of the law to the extent of its validity or even declares that it would have enacted any portion of the act irrespective of the possible invalidity of any other portion. Such declarations are perfunctory, and if the invalid portion or application is vital to the entire law the declaration will avail nothing.

While the constitutionality of a statute always presents a question of law its invalidity, particularly in the case of the professed exercise of the police power, may be due to the absence of justifying factual conditions. A conclusive presumption in favor of the legislative judgment would make the police power absolute. On the other hand, since the legislature is organized as a fact finding body with regard to the needs of the public welfare, while a court is not, it is a delicate matter for the court to take judicial notice of the non-existence of evils or dangers upon which the legislative action is predicated, and this constitutes one of the crucial difficulties of a judicial censorship over legislation—a difficulty to which was mainly due the movement for the “recall of judicial decisions” sponsored by the Progressive party in 1912.

The Supreme Court recognizes that legislation which under normal conditions would impair the constitutional liberty of contract may

become justifiable under the stress of an emergency, losing its validity when the emergency disappears [Rent Cases, 256 U. S. 170 (1921); 264 U. S. 543 (1924)]. The Supreme Court has not laid down the converse proposition that a statute which it has declared invalid when enacted will be resurrected by the emergence of stronger justifying conditions, still less that it will draw life from subsequent judicial enlightenment as to the requirements of the public welfare. However, a newly enacted statute is always entitled to fresh examination, and a future retreat from some of the present decisions adverse to the exercise of the police power is not only possible but very probable. Indeed, the police power, used as a reserve concept in the losing fights of the crown against Parliament and of the state against the national legislative power, may in turn become the progressive concept by which private right will be made to yield to claims of social control.

A special condition exists where the statute operates through the exercise of administrative powers which are required by the statute to be exercised reasonably. Constitutional defect will then arise only from administrative action which by reason of such defect is reviewable by the courts and in the last resort by the United States Supreme Court, since the Fourteenth Amendment is involved. In the case of public utility rate orders successful judicial contest results in decrees prohibiting the administrative authority from interfering with the charging of a rate fixed by the court as non-confiscatory. Judicial action instead of being merely negative thus becomes in effect corrective and capable of a continuing adjustment to changing conditions. This more conservative and constructive enforcement of the constitution is possible because the statute in itself is valid, and a court has greater facilities of control with regard to administrative than with regard to legislative action.

As applied to legislation constitutional law must necessarily be negative and non-constructive. An adequate handling of many constitutional problems requires regulative adjustments, of which courts are incapable and which are not conformable to the rigid or rigidly interpreted structure of a constitution. The solution would be in a greater inclination of courts to interpret constitutional provisions as directory rather than as mandatory, but the tendency is rather the other way.

American constitutional law represents politi-

cal action through judicial methods, dependent for success upon the ignoring, by common consent, of the political nature of the process. To judge the performance of the courts by purely legal standards is to misjudge it. The uncertainty of standards, which is a legal defect, is the salvation of the doctrine of judicial power. How much the exercise of the power has added to the stability of American institutions must be a matter of speculation. It is not even possible to speak of its effect upon the sanctity of vested rights with any assurance, for not only is exaggerated respect in some cases [Trustees of Dartmouth College *v.* Woodward, 17 U. S. 518 (1819)] more than offset by the way in which public utility legislation and the federal control of waters have been allowed to override contractual arrangements [248 U. S. 372 (1919); 204 U. S. 364 (1907); 219 U. S. 467 (1911)], but in two striking instances, the abolition of slavery and liquor prohibition, the taking of property without compensation has been accomplished by constitutional amendment, thus placing it beyond the reach of the judicial power. A comparison between American and foreign legislation in this respect would yield no definite results. The American doctrine of freedom of contract does not impress foreigners as a gain to genuine liberty.

It is indeed a striking feature of American constitutional guaranties that with the exception of the Thirteenth Amendment, which protects against peonage, they afford protection only against the possibility of abuse of governmental power and not against the possibility of capitalistic exploitation. It is true that some of the phrases of the new German constitution which seem to recognize a new social freedom of some positive content depend in the main upon legislative effectuation, but occasionally they also restrain property rights and the freedom of contract, and it is significant that this constitution directly invalidates contracts restricting the freedom of collective labor action. There is no parallel to this in American constitutional law.

It is, on the other hand, a strong tribute to American constitutional law that it has been found possible to conduct government for a century and a half in war as well as in peace without recourse to "acts of state" or to emergency powers to suspend the constitution. While occasionally the judicial nullification of statutes has caused popular resentment, there has been substantial acquiescence in the exercise of the power and there is no disposition to doubt the sound-

ness of the structure of which it is the corner stone.

Powell, 1919-23 by E. S. Corwin, and since 1923 by R. E. Cushman; the years 1919-22 have also been summarized by T. R. Powell in the *Michigan Law Review*.

CONSTITUTIONALISM is the name given to the trust which men repose in the power of words engrossed on parchment to keep a government in order. The writing down of the fundamental law, beyond peradventure and against misunderstanding, is an important political invention. It offers exact and enduring language

as a test for official conduct at the risk of imposing outworn standards upon current activities.

The idea of a constitution derives from three elementary notions. The first is a greater law. Once the sovereign ruled in his own or by divine right. The cause of curbing monarchs attracted honest men and had to be made worthy. The king was put in his place, and kept there, in the name of a law above his own. The second is an individual right. Once persons enjoyed perquisites and endured deprivations at the pleasure of their betters or by the grace of God. As groups bought, wrested or wrangled exemptions from their overlords they found sanctions for their actions; liberties became rights, an original possession of man, established in nature. The third is a charter. Once the throne was above parchment. As its authority waned the belief grew that the people had created the government, granted it limited powers and specified the manner of their exercise. As evidence of this prerogative charters great and small, petitions and bills of rights, were endowed with appropriate meaning. The deficit in testimony was made up by the assumption of a social contract; it was a short step from a convenient fiction to a real covenant. A law for the government, safeguarding individual rights, set down in writing — that is the constitution.

The rise of constitutionalism may be dated from 1776. It comes with struggles against irresponsible authority; it is the product of the vision of a new freedom. The chaotic struggle in America had hardly centered upon independence before charters for colonies began to be converted into constitutions for commonwealths. The French Revolution, the wars for liberation in South America, the reform movements of 1848, were all followed by many great enactments. The new constitutions of contemporary Europe, with the shift of emphasis to economic rights, have come in the wake of the great crusade to make the world safe for democracy. From the two revolutionary centers of the United States and France the contagion has spread throughout the Americas, continental Europe, Australia, South Africa and even into the Orient. In a century and a half a count of instruments in which peoples have embodied their faith runs into the hundreds.

The constitutionalism of the United States is richest in incident and meaning. The year 1787 fell in a period of reaction; the convention at Philadelphia met behind closed doors; the dele-

gates were gentlemen of substance and standing. They set down a federal government; enumerated rather than defined its functions; allocated powers "between existing states and a potential nation"—and contrived to turn the democratic innovation of a constitution to conservative use. The result, effected by numerous compromises, concurred with the plans of none, yet represented what all who signed were willing to accept. The ratification, against vigorous opposition, was secured by the addition of a rather consciously neglected bill of rights. The framers, "nation-builders rather than code-makers," faced a current problem in law and order, set down the best answer they could and hoped that they had established an enduring government.

The endowment of the constitution with divine origin is of another generation. The era of the aging Marshall, of Webster and the *Reply to Hayne* created the notion of "the greatest document ever struck off at a moment by the hand of man." The common people, recently enfranchised, demanded a symbol of their liberty and sovereignty. Eighteenth century rationalism was gone; evangelism with its eternal verities was to possess the land for many decades. The Bible of verbal inspiration begat the constitution of unquestioned authority. The plain man found in it a statement of simple and obvious truth level with his intelligence. The man of learning, who had no cause to doubt first principles, made it an established base for speculation. As the Bible wanted exegesis, the constitution demanded exposition. Its catholic clauses yielded to deduction precepts suitable to the cause and the occasion; it became the great storehouse of verbal conflict, and rival truths were derived by the same inexorable logic from the same infallible source. The Civil War was waged for a Union which it had created; the object of secession was to secure rights guaranteed by the constitution. The signers, of an average age of forty-three, became the Founding Fathers; their will was to be discovered and obeyed; the great document claimed veneration and accorded vindication.

The rising constitutionalism, which was to outlast the century, left a varied expression. There was worship at the shrine of liberty and of law. The document was the most perfect instrument of government ever contrived; its foundation rested on the everlasting rock of impartial justice to all. It was in its multiple essence a great spirit, a divine rule and command, a high altar, a faithful mirror of a nation's heart,

an impenetrable fortress guarding the gates of freedom, and many other wonderful things besides. It was, like the Ten Commandments, to be early learned and thoroughly understood. In its adulation a competition between schoolboys was staged, with local, state and regional contests and a grand finale in the Capital City. Every organization, whether for dialectic, charitable or convivial purposes, had to have its miniature constitution. Orders, leagues, associations sprang up to crush trade unionism, to keep aliens away, to prevent the recognition of Soviet Russia, to make an outcry against prohibition—all in behalf of the constitution. The telephone directories of Washington display a parade of organizations all nobly named and all concerned alike to save the sacred document from oblivion and to serve special interests. The magic of infallibility was extended from the constitution to its official exposition and even to the president's appointment of justices. These are mere samples; a catalogue of the colorful phenomena of constitution worship has not yet been drawn.

But the faith of the fundamentalist has not kept the constitution unchanged. It is not a self-regulating mechanism which automatically holds official conduct to conformity with its lines. An instrument which sets up a government of laws and not of men begins with compromise in its need for interpretation. Its compulsions lie not in what is written down but in what is read from the parchment. The office of construing the text, which the Supreme Court holds by self-appointment, is beset by hazards. Words have no true and natural meaning; verbal currency passes uncertainly between different generations. An intent packed away in stately phrases may be lost; principles may be drawn out of a document which were never stored there. The justices of the highest court do not of necessity embody the law. They are men of acumen, knowledge, reason, unlike one to another; even in resolving constitutional issues they behave like human beings. In the endless process of the finding out of meaning the vote of the odd man counts for more than insight into the true meaning of a phrase.

In the procedure questions of policy become issues of constitutionalism. The validity or the nullity of legislative acts contrived to meet the needs of a great industrial society depends upon the manifest intentions of the distant authors of the covenant. The test runs in terms of jurisdiction, powers and processes of law; the existence of the evil and the appropriateness of the remedy

are considered only as they fit into the formula or as justices allow their minds to stray from legal law. Yet in matching statutes against the organic law many ingredients unknown to its authors get drawn into the construction. Justices make use of the common law, as it is understood, to clear up ambiguities. They draw upon the previous decisions of the court to bridge the gap between novel issues and ancient verbiage. They sometimes listen to plausible rules made up by ingenious attorneys and set them down as constitutional principles. As men of experience and opinion they never escape the light of their own understanding. The less sophisticated often believe their own preferences are to be found plainly written in the constitution; the wiser ones frequently make up arguments which march straight to their chosen conclusions. The "let's pretend," with its submission of current issues to the judgment of the Fathers, imparts to the process of interpretation aspects of an ordeal at law.

As cause follows cause the law of the constitution is spelled out. The handiwork of lawyers, it bears the mark of their craft. It has small concern with many sections of the document; issues involving titles of nobility and bills of attainder do not come along. It finds endless occupation, however, with other sections. Cases turning upon whether commerce is among the several states or whether persons are denied the equal protection of the laws are constantly before the court. Constitutional law responds to the exigencies of procedure. A referendum may or may not violate the guaranty to the states of a republican form of government; the Congress may or may not join states in supporting maternity work on a fifty-fifty basis. Yet the practices have gone on, for their opponents have contrived no way of raising legally the constitutional questions. Use is made of precedents. The decision of a case is buttressed and explained by language used on former occasions; a verbalism, divorced from specific holdings, may be carried through a series of unlike cases. The same rule is applied to gasoline for government use and to royalties from a patent because they are both federal instrumentalities; to theater ticket scalpers and to employment agencies because they are alike brokerage. Principles are created not to be discovered in any article: a state cannot tax an instrumentality of the federal government; a public control of prices is forbidden in industries not affected with a public interest. In the decorous course of time a simple text is elaborated

into a complicated code. The constitution is a brief document; the law of the constitution lies scattered in a series of reports which runs on toward the three-hundredth volume.

The manner of its construction has not left the constitution untouched. The usage of judicial review, unknown to its lines, has become its most distinctive feature. The voice of the jurist gives to the provisions of the organic law their distinctive and pragmatic meaning. The document is of secondary importance; it is the instrument employed in the process. As a result the Supreme Court assumes a legislative function. It allows Congress to avert a nation wide strike by imposing a settlement upon railroads and their employees—and argues that the emergency furnishes a mere occasion for the exercise of powers which have lain dormant from the beginning. It permits a state to provide for the guaranty of bank deposits and to make employers liable for industrial accidents but not to regulate the weight of loaves of bread or to curb private employment agencies—and contends that the police power permits and due process denies what it sanctions or forbids. The court employs a legal formula; but none the less it marks out, for state and for nation, the limits of the province of government. In like manner the legislature cannot escape a judicial function. The attack upon a current problem cannot be simple and direct; a roundabout way is frequently necessary to satisfy the constitution. Under the make believe of raising revenue Congress taxes out of existence the trade in narcotic drugs; a solemn agreement with a foreign nation allows the treaty making power to give a sanction to a federal statute protecting migratory birds. The committees which shape legislation habitually put constitutionality above expediency; dicta in opinions are accorded the weight of authority; measures are not reported because of a guess that they are invalid. The court possesses a veto power over legislation; the legislature fixes the jurisdiction of the court. A strange twist is given by the law of the constitution to the constitutional doctrine of the separation of powers.

At times the constitutionalism of the bench has been remarked and even criticized. The assertion of judicial supremacy by Marshall brought protest from the Jeffersonians. The Dred Scott decision, permitting slavery in the territories, was met by an appeal of the abolitionists to a higher law. The country people, from granger days to farm relief, have berated

the court for its usurpation of power; the trade unions have protested against decisions impairing the effectiveness of collective bargaining; the antiprohibitionists have piled up syllogisms to prove an amendment to the constitution unconstitutional. Liberals have cried out in the name of individualism against approval of restrictions on free speech and free assembly, and in the name of collectivism against judgments adverse to social legislation. Students have observed a conspicuous example of legal lag: it took the court twenty years to discover that the Fathers never meant to forbid the fixing of railroad rates by commission; a decade sufficed to remove invalidity from regulation of hours of labor. The popular dissatisfaction was greatest in 1912 when Roosevelt undertook "to put the fear of God into judges" and demanded the recall of judicial decisions. A later evidence of distrust has been the close scrutiny by the Senate of appointees to the bench.

It is not the written constitution which has been under attack. The criticism has been directed rather at judgments of the court than at the provisions on parchment. There has been little demand to abandon the instrument or even to contrive a better one; the practical aim has been to still or to quiet the voice of the interpreter. An unwritten constitution—or one untouched by judicial review—evokes a different behavior from lawmakers and jurists; but it guarantees no quicker, neater or more just an accommodation of political control to the needs of a people. In checking popular legislation and in shackling the present to the past propriety is as powerful as constitutionality. The genius of constitutions, written and unwritten alike, lies in usage.

As a purposive device the constitution has not been proof against paradox. Man contrives his formulas and time and chance rewrite them. A supreme law is invented to guard the rights of a people against an unpopular government. The scroll is written, the government becomes popular, the judiciary proclaims itself interpreter—and divine right is replaced by the aristocracy of the robe. It is set down that the great offices in the new republic are to be filled with the wise and good, chosen by select men; there is formal amendment, the rise of political parties, the growth of strange customs—and the aristocratic provisions of the constitution become democratic. An abracadabra is appended to make the people secure in their persons and property against arbitrary acts of an untrusted

officialdom; corporations become persons, vested interests are accounted property, social legislation appears as deprivation, due process becomes a standard in judicial review—and the democratic provisions of the constitution become aristocratic. A society which thinks in static terms of political perfection contrives the best government it can and safeguards it with a rigid amendment clause; a society which talks in the dynamic terms of progress finds the provision a formidable obstacle to political adaptation. If the court cannot square current necessity with the ancient law, a small minority have the power to block formal change—and the creation seems to have taken its creators into captivity. The constitution as a precaution born of experience is an admirable protection against the dangers of another age; as a current institution its life lies in its extraconstitutionality. The failure of event to accord with intent does not distinguish it among human arrangements.

All of this, of course, is merely descriptive and has nothing to do with goodness or badness. But if there is to be appraisal, the constitutionalism of the people must be distinguished from that of the bench. If the people must have a sign, the constitution serves for lack of a better. The object of worship is an ideal of law; the act of faith is almost untainted with knowledge; the ceremonial purpose is served without throwing confusion into the immediate problems of politics. The danger that an abstract loyalty may be played upon to serve specific causes inheres in the very use of a sign. If the bench too demands its symbol, the constitution enables it to speak with a voice which is not its own. It serves the purpose better because its imperatives are not categorical. It is no mean task to umpire the affairs of an evolving nation under the lingering forms of a federal union of states. But the bother lies not so much in the constitution as in its far flung explanation. A shrewd jurist has written, "Its unchanging provisions"—that is a popular gesture—"are adapted to the infinite variety of the changing conditions of our national life"—that is judicial sense. Where adaptability is, the eternal does not matter. The skilled interpreter knows how to march language and meaning along the same line of argument in opposite directions. It is this rare art which transforms the ritual of constitutionalism into an institution of social control.

CONSTITUTIONS. In the most generous sense of the term every country is and has been historically, except in time of revolution or other serious upheaval, governed under something that may be called a constitution (for a historical survey, see GOVERNMENT). But governments vary greatly in pattern and principle, and their constitutions vary even more greatly in such matters as form and content, source and tangibility, stability and permanence. It is in consequence difficult to define a constitution save in terms of rather precisionless and therefore rather useless generality. This difficulty has not daunted publicists and other commentators. Scores of definitions might easily be assembled. Some of these define with reasonable accuracy a particular constitution or group of constitutions. But few if any of them suffice to include all that may properly be regarded as constitution and to exclude all else. Yet constitutions are not generically unreal because they elude the grasp of words. Perhaps as safe and close a definition as any is that they are the fundamental laws and practises in accordance with which governments commonly operate. But manifestly the use of the word fundamental introduces a wide margin of indefiniteness in respect of which opinions will differ.

It has long been customary to distinguish between written and unwritten constitutions, and the constitutions of the United States and of Great Britain have usually been cited as the examples par excellence of these respective types. This aspect of the subject, although a matter of schoolboy erudition, no doubt requires some mention in any general consideration of constitutions. The written constitution is

usually a single document, amended or unamended from time to time as the case may be. But no constitution in the form in which its functions is wholly written; for most of these documents are relatively brief and require supplementation in important particulars. In addition to this, time invariably weaves about them political customs that become durably fixed. Occasionally such customs very nearly belie the written words of the instrument. Well known instances in point are the customs connected with the machinery of electing an American president and the custom of holding him politically responsible as the leader of national legislation despite his designation of chief executive and despite the doctrine and constitutional rule of the separation of powers.

Even so, in the case of most written constitutions a comparatively large number of the fundamental principles or arrangements upon which the government of the country is organized for operation are found in the words of the constitution itself. It is certain that from a study of the written constitution of the United States or the French Republic or the German Reich a person wholly ignorant of the politics of the particular country could form at least a blurred mental picture of its political and governmental outlines. For a picture of such outlines under an unwritten constitution he would be compelled to rely upon commentators and explainers.

The relative merits of written and unwritten constitutions have often been debated. But much of this debate appears to proceed from the specious assumption that a people can ordinarily elect to be governed under the one or the other type of instrument. It is easy to choose to be governed under a written instrument, but probably no people ever deliberately chose the unwritten type. Unwritten constitutions have invariably been evolved from absolute monarchies or autocracies. Indeed, this would seem to be an almost indispensable condition, for unwritten constitutions rest upon customs and time is a requisite ingredient of custom. Meanwhile, however, the power of government must be exercised by someone or some group. It must, so to say, be seized. Now while the seizure and direct exercise of power by an absolute monarch or relatively small group are not only conceivable but have not infrequently happened, it is very nearly inconceivable that a large group—all of the adult males, for example—could seize power and proceed to govern without committing to writing anything concerning the

organization of the government. For in any sizable country government by the many involves of necessity the application of some kind of representation. And although more or less spontaneous and irregular conventions or congresses of delegates are not unknown to history, nevertheless the representative idea, if it is to continue any length of time, invites if it does not actually compel written arrangements. While therefore an unwritten constitution may develop around a going monarchy or close aristocracy and may in the course of time become broadly democratized, it is difficult to see how a democracy, lacking these agencies, could carry on the necessary processes of government during the period that would be required for the gradual building up of customs.

In the case of federal governments, which have in most instances been dictated by expediency if not necessity, the imperativeness of a written instrument is even more obvious. The essence of federalism is that governmental powers are divided between a central or national government and certain definitive local units of government and that this division may not be altered by the independent action of either the one or the other. Such a division even when committed to writing usually involves a considerable number of legal and practical difficulties. That it should come into being in any true form by the evolution of mere use and wont would be almost unimaginable.

"Flexible" and "rigid" are also terms that are sometimes applied to unwritten and written constitutions. At least Lord Bryce, who coined this classification, used these terms interchangeably. But surely this is to confound substance with legalistic appearance. An unwritten constitution may or may not be flexible; a written constitution may or may not be rigid. In legal theory the British Parliament may at a stroke alter the British constitution in any respect that it chooses or the prime minister may destroy the convention of cabinet government by the simple expedient of not calling the cabinet together. But such things do not happen. In the realism of history the British constitution is not flexible. It changes very slowly. Apart from the several extensions of the suffrage, the subordination of the House of Lords in 1911 and the altered imperial status of the self-governing dominions since the World War it has flexed very little in the course of a century. Indeed, despite the potentialities for change that exist under unwritten constitutions it is probably true

to say that they tend toward rigidity rather than flexibility. Nor is this surprising, for they rest largely upon customs and customs commonly wax and wane but slowly.

On the other hand, written constitutions may prove to be very malleable instruments. Mussolini has had no difficulty whatever in warping to his wishes the written constitution of Italy. In Russia under the Soviet regime, although there is a written constitution, it is completely subordinated to the Communist party. The Politbureau of this party, unmentioned in the constitution, is nevertheless the most powerful governmental agency in the country. It is a law unto itself above and beyond the constitution. It may be argued, however, that such instances are exceptional and probably ephemeral. But instances may be cited of other written constitutions which in practice have lent themselves readily to change. The constitutions of many of the American states are in this category. Some of them are amended with great frequency. The constitution of Austria has been amended in numerous important and unimportant particulars since it went into effect in 1920.

The flexibility or rigidity of a constitution can best be tested pragmatically. If it is often altered it is certainly flexible. If it is rarely or never altered it probably should be classed as rigid. But the curious fact is that in many if not most instances the difficulty or facility of the amending process appears to have little to do with the matter of flexibility or rigidity. The French constitutional laws may be amended almost as readily and as quickly as ordinary statutes. But the fact is that they have been seldom changed and that no amendment was adopted from 1884 to 1926. This is certainly not referable to the perfection of the French system of government. The constitution of the old German Empire which lasted from 1871 to 1918 was not difficult to amend but was infrequently amended. An amendment to the Constitution of the United States may be proposed by a two-thirds vote of the houses of Congress and must be ratified by the state legislatures or conventions in three-fourths of the states. History discloses that the difficulty of this process lies in the requirement of a two-thirds vote of the houses, for amendments are very rarely proposed to the states by Congress. Since the adoption of the three Civil War amendments only five amendments have been so proposed and only one of these has failed of ratification. But the constitutions of a number of the American states also require that

amendments be proposed by a two-thirds vote of the two legislative houses and in some of these experience has demonstrated that this requirement presents no obstacle whatever to frequent amendment. The test of rigidity in a constitution is therefore not necessarily to be found in the difficulty of its amending process. It is quite possible that amendments to the American constitution would not be frequently proposed even though an ordinary majority of the houses were empowered to propose them. It is also quite impossible to say how serious the obstacle of ratification by three fourths of the states might prove to be if Congress proposed amendments more frequently.

Since the launching of the American nation under written constitutions both for the several states of the union and for the national government the practise of committing the fundamentals of governmental organization to writing has become increasingly common. These instruments, however, have sprung from a variety of sources. A few of them have been drafted and promulgated by more or less regular legislative bodies. Such, for example, were the American Articles of Confederation of 1781 and the Austrian constitution and Austro-Hungarian *Ausgleich* of 1867. During the nineteenth century a number of constitutions were granted by kings and princes—the so-called octroyed constitutions—but these instruments, whatever their legal appearance of voluntary concession or gift, were usually wrested from more or less absolute monarchs by popular demand. Such were the French constitutions of 1814 and 1830, the constitutions of the several German states proclaimed prior to 1850 and the Sardinian constitution of 1848 which by successive proclamations became the constitution of a united Italy in 1861. The vast majority of constitutions, however, have been formed and adopted by special constituent assemblies convoked for the express purpose of making a constitution, although as might be conjectured the popular basis of these conventions has varied widely. Practically all of the American constitutions have originated in such conventions, and among those in Europe of similar source may be mentioned the constitution of Belgium, 1831, of Switzerland, 1848, of Denmark, 1849 and 1866, and of France, 1875. The constitution of the North German Confederation of 1867, which substantially became the constitution of the German Empire in 1871, was drafted by the Prussian autocracy and was accepted by the

governments of the other German states; but between these important steps in the process it was also ratified by a popularly elected assembly. All of the European constitutions that were adopted after the World War were drafted by specially convened assemblies. Of similar origin are the constitutions of the British self-governing colonies, for although these are in ultimate law acts of the British Parliament they have in fact emanated from dominion conventions.

The practise of drafting constitutions by constituent assemblies was to some extent a logical outgrowth of the development of the democratic idea. Power to govern was regarded as proceeding from the people acting through a relatively wide electorate. A constitution embodying fundamentals came to be conceived as a superior kind of law. But in a country of size the people's power could be exercised only by representation. An ordinary legislature was scarcely an appropriate representative body for the enactment of an extraordinary law such as a constitution. Hence a special representative assembly was called into being. While this trend of thought—not to mention the more abstract theory of the social contract—must have exerted considerable influence, the role of political expediency and practical necessity must not be disregarded. For not a few constitutions were liquidations of revolutionary movements that resulted in the shattering or undermining of existing institutions. In such emergencies if the principle of democracy was to find expression an ad hoc constituent assembly for the setting up of new or the remodeling of old institutions was certainly a rational, indeed almost an indispensable, mode of procedure. It is worth noting, however, that except in the diminutive state of Switzerland the democratic principle has nowhere prevailed to the point of submitting national constitutions to acceptance or rejection by direct popular vote.

The degree to which written constitutions are regarded as superior laws varies from country to country. It finds most complete acceptance in those countries in which the courts exercise the power of refusing to give effect to laws which they hold to be in violation of the constitution. The superiority of the constitution is thus vindicated in a practical way. By this process legal theory as well as popular sentiment is distilled into reality by the more or less frequent assertion and specific application of the principle of constitutional superiority. The exercise of such a veto by the courts arose in the United States,

where it has played an important institutional role not only in molding the popular conception of the sacrosanctity of the "supreme law of the land" but also in influencing the course of economic, social and political trends and events. Despite the long period of time during which judicial supremacy has flourished in the United States and despite the numerous constitutions that have been drafted and effectuated since it first took root in American soil, it has not been widely transplanted. It was servilely copied in a number of Latin American countries but the instability of their governments has deprived it of a suitable stage for adequate performance. It operates in Australia much as it does in the United States; and to a vaguely limited extent it was incorporated into the post-war constitutions of Austria and Czechoslovakia.

Elsewhere the supremacy of a constitution over statutory law and executive order depends for its effectiveness largely upon the degree of deference which the government of the moment accords to it. Naturally this varies with country, time and circumstance, and it affects and is affected by the prevailing popular attitude. But generally speaking, at least in countries of reasonably stable politics, the prescriptions of a written constitution are not often ruthlessly ignored by those who hold the reins of government. For the most part constitutions are in a very real sense supreme laws.

CONSTITUTIONS OF CLARENDON. See BENEFIT OF CLERGY.

CONSTRUCTION INDUSTRY. Recognition in recent years of fundamental similarities in all phases of construction activity has led to the abandonment of the old occupational classification of building trades and to the use of the term construction industry to cover not only the erection of new and the alteration of old buildings but the construction of railways, roads, streets, subways, bridges, harbors, water supply, sewers and disposal works and similar engineering projects. In all these closely related branches there exist similar problems of organization of work, similar types of technical and manual skill, materials, processes and tools. The approach from the industrial rather than from the occupational aspect has led to an inclusion under this heading of certain aspects of the building materials industries as well. Nevertheless, special problems of financing and control peculiar to those branches of the industry classifiable as public works or public utilities demand special treatment.

A historical survey of the industry and art of construction shows that until the rise in importance of private building with the coming of the industrial revolution the broader basis of definition was the one generally accepted. In ancient and mediaeval times the most important aspects of the industry were those connected with public and semipublic works, and in these the chief advances in the art of construction were made. In ancient Egypt, for example, it was in the erection of the pyramids that new methods and processes and finer tools of bronze and other metals to supplement the more primi-

tive flint axe and adze were developed. The Greek public buildings were achievements in masonry made possible by improvements in the use of iron and iron tools. The most important advances were made by the Romans, who employed a number of new materials, particularly cement and long beams of iron, for their large and complex structures. After the great fire in Nero's reign a high degree of organization of work and considerable skill were developed. The vast public building projects were under the supervision of a state architect who through a small number of highly skilled supervisors directed a vast labor force drawn, as in Egypt, from hordes of unskilled serfs and slaves. An immense building organization composed of engineers, masons and carpenters accompanied the army in all its expeditions. Using forced labor drawn from the conquered races, and with materials furnished in payment of part of the provincial tribute or tax and transported free in return for trade privileges, the Roman Empire covered the civilized world with structures and highways at a cost to the home government consisting only of the maintenance of the army of workers. Once the period of conquest was over, the guilds of the arts and trades provided the larger cities of the empire with free labor for public structures in return for incorporation and monopoly privileges.

With the decay of the Roman Empire the art of construction declined for several centuries. When western Europe after about the sixth century began to develop again its own architecture and methods these were applied primarily to fortresses, castles and cathedrals, and other types of building were neglected. Under the feudal system the role of free enterprise in building was negligible; labor was furnished either by members of monasteries or by serfs, who gave their services in return for education and subsistence. Artisans' associations first developed in the eleventh and twelfth centuries in Italy, where the commercial revolution preceded that of other countries, and from there spread gradually to the rest of Europe. From the twelfth century to the period immediately preceding the industrial revolution guilds of carpenters, joiners, masons, bricklayers, tilers, painters and plasterers were active in the economic life of the larger cities of western Europe and particularly in England. These guilds included not only the artisans but also the architects and other groups contributing to construction. Guild regulations, together with sporadic

laws fixing wages and prices, led to emphasis on craftsmanship and quality as a means of avoiding unfair competition. The guilds were also interested in protecting the artisan and in regulating wages and hours. As division of labor and specialization of processes progressed the guilds multiplied in number rapidly; in several countries legislation, such as the British law of 1363, confined each guild to the practise of one single craft, with the result that jurisdictional disputes, not among workers alone, as in the modern building trades, but among whole craft groups, developed. Such conflicts led in the fourteenth century to a movement for the amalgamation of related crafts on the basis of similarity either in type of occupation or in materials used.

In the sixteenth and seventeenth centuries the political and economic forces which operated toward extension of the area of national control weakened the power of the guilds, which were primarily local organizations. Guild regulations, particularly those relating to apprenticeship, became increasingly difficult to enforce both upon the masters and apprentices. Even the *compagnonnages* of France and Italy, which were national and international organizations of journeymen mainly in the building trades, could not survive the disintegrating effects of their own jurisdictional disputes and of the forces of the new economic order.

During the period of the commercial revolution expansion was most marked in road building and, as urban life began to develop, in city housing. The industrial revolution, especially as it manifested itself in nineteenth century England, heightened the rate of development in these two fields and also brought the need for industrial buildings to house machinery and large numbers of workers. Religious, military and public buildings were superseded in importance by factories and industrial housing requiring a different sort of craftsmanship and different materials and technique. At the same time the role of the building entrepreneur became more important not only in commercial but in public construction, and the older relationship between worker and owner was changed by the appearance of the contractor as supervisor of the job. England's precedence as an industrial country made it inevitable that new methods of business organization, such as the contracting system; the first of the new materials, such as Portland cement and Bessemer steel; and the first of new processes, such as brickmaking by machinery, should originate in

England and that the first important trade, labor and employers' associations should be formed there.

It was in the construction industry of the United States, however, that the most revolutionary economic and technological changes of the last fifty years occurred. These changes are interrelated with the dynamic nature of American economic and social life; they have been conditioned by the rapid rise of new industries and of new communities, by the high degree of urbanization in the United States, by the mobility and rate of increase of the population; they have been stimulated by the demands for better housing and for amusement and recreational facilities, all of which involve new construction and result from a more widespread distribution of income; they have been made possible by the comparatively easy accessibility of capital for all types of building. American buildings have a much shorter life than those of European countries and wrecking and remodeling swell the volume of construction. The development of motor trucking and of the power industries have had important effects on construction. Moreover, private enterprise is far less controlled by building codes and regulations than in European countries. The favorable bargaining position of labor and of building material and equipment groups as well as of realty owners has furnished incentives for inventions of labor saving machinery, for the use of new materials and for trends both in building concentration and expansion which in turn have affected the construction of highways, subways and other means of transportation.

The most revolutionary changes in modern construction methods and materials have all taken place within the last forty years. Iron, which lacks fire resisting qualities and is likely to contract or expand, was replaced by Bessemer steel, which became commercially available in 1886; not until after 1890 was there any great utilization of Portland cement, the important ingredient in concrete, which, used with steel reinforcements, furnishes a fireproof material of the necessary compression and tensile strength. A rapid extension of its use was made possible by a number of new inventions about 1890. The development of the steam passenger and electric elevator removed the first obstacle to high structures; the need for new foundations for the steel skeletons, especially in skyscrapers, was met by the pneumatic caisson process. The tendency to the replacement of wooden struc-

tures, dwellings and business blocks by steel frame apartment houses and skyscrapers has been strengthened by the growth of cities, the increased strictness of fire regulations and by the rising costs of lumber due to forest depletion.

The increasing demand for materials following upon the expansion of the industry has greatly accelerated the mechanization of the industries producing materials, in most of which output per man hour has almost doubled. Machinery has replaced manual work in the lumber mills and yards, in woodworking establishments and in the manufacture of cement. Factory methods have been applied to the production of limestone, steel and other commodities. Brickmaking machinery, although developed before the Civil War, has been extensively used only since 1890; this industry has been further placed on a mechanical basis recently by the use of electricity as the motive power. Indeed, it is now possible to eliminate hand labor in most processes of brickmaking from the time the steam shovel takes the clay out of the ground until the hodcarrier gives the brick to the mason on the wall. These new methods, however, have not been universally applied in the United States and are even less generally utilized in most of the European countries.

The mechanization of the building worker's job is much more recent. The hydraulic and pneumatic riveter, rock drill, the power hoist and derrick, all now indispensable in building construction, came into general use for building purposes only after 1900. The steam shovel, although invented in 1839, was not available until the eighties for railroad construction and only after 1900 for building purposes. Hoisting engines which came on the market after 1880 have recently been improved by electric and gasoline motors and even compressed air. With the increasing use of concrete, power mixers replacing the old method of hand mixing have become of importance. Woodworking machinery for sawing, planing, molding, mortising and boring has resulted in the manufacture of wood products in the shop and their delivery to the job ready for installation. The cement gun and the paint spray have reduced the labor of painting over 50 percent. A sanding machine for floors operated by one man can do as much as six hand workers. The high wage rates of building labor since the war and the shortage of labor for a brief period after 1921 helped to accelerate this whole process. Its extent is

somewhat indicated by the fact that in 1925 over 500 manufacturers were producing machinery for construction purposes; the recent practise of renting machinery is even further strengthening this tendency.

This cumulative mechanization has resulted since the war in a decrease for large construction projects of from 30 to 40 percent in the time required for building. In road building, for instance, it is estimated that the daily output of lineal feet of road surfacing per man has increased from 4.7 in 1919 to 17.7 in 1928, an increase due largely to vast improvements in power driven equipment but affected also in part by better organization of work. The development of new techniques has been stimulated by the appearance of wholly new types of activity, such as the construction of airports.

But while mechanical methods have been perfected for mass operation, on individual small jobs and for light tasks very little machinery is used even at the present time. The work of the mason, roofer, tile setter, carpenter, plasterer or painter is still commonly a hand operation even on large jobs and especially on residential work. This is particularly true in European countries, where incentives to the adoption of mechanical methods have not been present to the same degree as in the United States. Since the war, however, German house building has made enormous strides in mechanization; standardization of design and the factory production of actual portions of houses have resulted in a new record for speed of erection, not matched by American builders.

The very enumeration of these improvements suggests the wide ramifications of the industry and its consequent importance in the industrial life of the nation. This is so true that economists and business men in general have within the past decade come to regard the condition of the building industry as a barometer of the general trend of business. Only in recent years, however, have statistics of construction been available in sufficient detail to indicate with any accuracy the size and extent of the industry or to make possible a significant comparison with other industries. At the present time in the United States information is not available for all the states, and the most complete sources on building volume are the figures compiled by the United States Bureau of Labor Statistics or by the F. W. Dodge Corporation, representing the value of building permits issued in a large number of cities. These figures, however, give

only estimates of the possible cost of the projects; they do not include projects outside cities nor government projects for which no permits are required. The figures for contracts awarded are more frequently used, but these also do not cover most low cost structures, alteration work or construction in rural districts.

On the basis of this incomplete statistical material the United States Department of Commerce estimated that in 1926 the total volume of construction for the United States aggregated more than \$7,000,000,000 in value. This may be compared with the figure of \$6,449,000,000 representing the gross operating revenues of the steam railroads in the same year, and with \$3,371,857,000, the figure for the value of motor vehicle manufactures in 1925. According to an estimate of the National Bureau of Economic Research 8 to 12 percent of the national income is spent on construction. The following figures, although they take no account of price changes, give some indication of the volume of construction work in the United States, its rise or decline since the war and the proportions of the total expended on the various branches of construction work:

CONSTRUCTION CONTRACTS AWARDED BY CLASSES,

Adapted from reports of F. W. Dodge Corporation as cited in Gries, John M. "Construction" in *Recent Economic Changes*, 2 vols. (New York 1929) Vol. 1, p. 220.

Some further indication of the size of the industry can be gathered from a survey of the number of laborers employed. The United States Census of Occupations showed 2,467,500 employees and independent workers in the building trades in January, 1920, as compared with 1,108,424 employed on steam railroads, 1,018,967 in the extraction of minerals and

fewer than a million in textiles. The iron and steel industry, with 3,107,082 workers, alone exceeded it in number of employees. The situation may be summarized in another way by saying that the industry in the United States employs directly more than 6 percent of those engaged in gainful occupations and almost 18 percent of the workers in non-agricultural pursuits, and from ten to eleven million people are estimated as being directly dependent upon construction for a living. The significance of these figures is augmented by the fact that labor cost comprises 40 percent of the total costs, a larger percentage than in any other industry, and that these sums have an important bearing on general consuming power and prosperity. The industry's wage bill in 1926 was larger than that of any other industry, totaling approximately \$3,000,000,000 in comparison with the \$658,000,000 wage bill of the motor vehicle industry and a railway wage bill of \$2,990,000,000. The census total of those employed in the building trades does not include those engaged in supplying the erection trades with materials and tools. Certainly another million workers are employed in subsidiary industries such as sawmills, wood-working establishments, cement plants, brick and tile plants, and in manufacturing paint, hardware and other building materials. Moreover, the industry provides a market for a preponderant percentage of such products as steel, lumber, stone, brick, paper, paint and glass. It is, for example, the second largest customer of the steel industry, consuming about 14.9 percent of the total steel output in 1927 as compared with 13.3 percent taken by automobile manufacturers and 20.4 percent by the railroads. Probably more than 60 percent of all the lumber cut in the country is used for building construction purposes. In addition, building creates an almost immediate market for furniture, carpets, furnaces and household goods.

In the United States the most important branch of the construction industry has continued to be residential construction, which accounts for two fifths of the total amount of construction awards. Figures for such building, especially in the immediate post-war period from 1919 to 1923, suggest that the pre-war and wartime shortage in housing was probably in the main compensated for and that at all times this phase of construction has kept up with the annual increase in population. The second most important branch of the industry is that of public works and public utilities, which in

1928 constituted almost a fifth of the total. This group has special significance not only for the stabilization of the construction industry itself but because of the influence of planning public works in diminishing the evil effects on employment of extreme fluctuations in the business cycle.

In the post-war period the construction industry has not only expanded rapidly; it has also effected a series of internal improvements and a reorganization of methods to eliminate some of the wastes to which attention was attracted by the 1920 report of the Federated American Engineering Societies and by the report of the president's conference on unemployment in 1921. If reported corporate profits of the industry are to be taken as an index of its prosperity, returns of 11 percent for 1926 and 10.3 percent for 1927 compare most favorably with 7.9 percent and 6.3 percent respectively for these years for manufacturing, 3.7 percent and 7 percent for mining, 7 percent and 5.3 percent for transportation and public utilities and 6.3 percent and 5.7 percent for trade. These figures, however, give no indication of the distribution of profits to the various groups in the industry.

The period of inflation in the construction industries immediately following the war and the drastic results of the 1920 recession also called special attention to the instability of the industry and to its widespread effects upon general instability. The sources of waste and instability were traced by the engineering societies' report not only to defects in public planning and in the regulation of real estate and building activities but to a number of factors in the organization of the industry. Outstanding among these was irregularity in the employment of labor and in capital investment, due only in part to the seasonal nature of the industry and closely related to inefficiency of management (to which 65 percent of the waste was charged), especially as accentuated by the contracting system which has characterized the industry. According to the report wasteful labor regulations and jurisdictional disputes account for 21 percent of the total waste, and waste due to industrial accidents, inadequate designing and planning by architects and secondary groups and to other causes amounts to 14 percent of the total.

An important factor in the instability of the construction industry has been its organization on the basis of the contracting system. The rise and persistence of this system are due to certain

problems peculiar to the construction industry. In contrast to ordinary manufacturing, which is housed and utilizes a relatively permanent labor force, a construction company is constantly moving from place to place and frequently from city to city with a consequent high degree of instability in the labor force. The delivery of materials at proper intervals presents more difficult problems in construction than in factory industries, where there is some storage space provided for delays. The product or products of manufacturing industries are fairly standardized and the processes repetitive; in construction most of the operations have to be performed on the job, the skills and techniques involved vary widely, and despite the achievement of some degree of standardization recently in materials and designs the large variations in conditions from job to job are unpredictable and therefore offer obstacles to long time planning. Construction, an out of door industry, is more seriously affected by weather changes than is manufacturing, and seasonality although not primarily and inevitably caused by weather conditions has been more marked in this industry than in others. In order to distribute the overhead burden of carrying a large unwieldy organization through the lag seasons there has developed a system of contracting peculiar to the industry, which, while it distributes the risks due to these uncertainties and changes, also diffuses responsibility and makes concerted action for improvement extremely difficult.

During most of the nineteenth century the majority of the actual building operations from the laying of foundations to papering of the walls, especially in residential construction, were carried on by one general contractor or builder hired directly by the architect or owner. This man was often merely a building mechanic possessing a rudimentary knowledge of his trade and the ability to read specifications. The advent of steel and concrete and the increasing complexity of construction brought into prominence the general contractor with business, organizing and engineering training and resulted in a departmentalization of functions that often involved the establishment of a staff organization resembling that of a factory. In order to meet the requirements of the highly specialized branches of the masonry, structural steel, woodwork and mechanical trades, specialized subcontractors have multiplied in number until at the present time as many as thirty subcontractors are engaged on some jobs. A further distri-

bution of the risks and of the responsibility not only for skill but for storage of materials, capital investment and labor management results from the fact that each of these subcontractors is an independent entrepreneur. In such a system the general contractor becomes the organizing force for the entire project rather than the direct supervisor of any of the detailed operations.

The advantages of such specialization are endangered, however, by the methods of competitive bidding currently in use. Before awarding a contract the operative builder or architect of a project receives estimates from a large number of general contractors, who in their turn have received a large number of bids from subcontractors in the various branches, on which they base their estimates. Many general contractors and a larger number of subcontractors are inadequately equipped and trained to make a detailed cost study of a prospective job; such estimation is, moreover, unusually difficult since conditions of production are never as standardized as in manufacturing. The uncertainties are in general multiplied by this subdivision and apportionment to subcontractors, each of whom separately secures building and equipment estimates. Any benefit which the consumer might gain from this competition through lowered prices is more than offset by the money costs of the bidding system and by the shirking of quality and quantity specifications which it permits. The practise of shopping bids, which prevails in the industry and by which estimators are given the "opportunity" to revise their original figures in order to remain in competition for the job, is conducive to the acceptance of contracts below cost which lead to substandard labor rates where union control is weak, to a high rate of failures among contractors or to a shirking of specifications. This is especially possible when the general contractor is the broker type who is not himself a builder but merely compiles subcontractors' figures, adding his own overhead, and who knows nothing of labor conditions or technical requirements.

Several factors are now operating to modify or eliminate the abuses of the bidding system. Exploitation of labor is rendered difficult by the high degree of unionization. Protective associations of contractors have been formed which through codes of ethics and through their provision that all bids should be filed through the organization and made public have attempted to make competition open and above board, to

eliminate price cutting and bid peddling. These associations have been in essence price fixing associations. Another proposal emanating from the contractors is to make owners pay the costs of estimating, thus forcing owners and architects to limit themselves to those contractors considered reliable and competent. A third solution is proposed in the form of a quantity survey of all the materials needed for a project, to be made once through a central bureau rather than by ten or twelve separate contractors, in order to reduce the possibility of error or of deviations in quality. This system, which originated in England, has had a long and successful history there, but although agitation for its adoption was begun in the United States as far back as 1894 by the National Association of Builders it was not until after 1920 that quantity survey bureaus were established in many cities. Another suggestion has been use of the cost plus, or percentage, contract which relieves the builder of financial anxiety and places on the owner or architect the burden of selecting his general contractor with greater care. The system generally includes the fixing of a maximum price for the total cost of the building as a guaranty against unlimited expenditures, but it has been widely criticized as encouraging inefficiency and extravagance. In more general use is the lump sum contract, under which the contractor's profit or loss depends partly on his skill in figuring costs, partly on his luck in escaping unpredictable delays or problems. This system gives rise, however, to many disputes as to compensation for extra work, and until the recent establishment of the practise of introducing arbitration provisions in contracts it led to frequent charges of arbitrary and unfair decisions.

The most striking manifestation of waste, reciprocally aggravated by the contracting system, can be found in the irregularity of operation from month to month within the industry. From 1904 to 1916 an average of 25.6 percent of union building trade workers in the state of New York were unemployed, as compared with 19.8 percent in all occupations. The figures for New York are descriptive of the conditions in most sections of the country. Every process in the industry is organized, equipped and managed to meet a peak or maximum demand which is maintained only for brief periods. Building trade workers in Philadelphia lose an average of eighty-six days, or 31 percent of the possible working time, every year; in Boston in a normal year the workers are employed only 75 percent

of the time, with a compulsory idleness of about three months each year; building workers in New York City are employed approximately 83 percent of the time. Not only the erection processes but also a host of industries subsidiary to construction are affected by this irregularity. Manufacturers of material, dealers, contractors and architects are also subject to the same periods of feast and famine.

The principal causes of this instability, which it should be noted is only in part seasonal, are climatic conditions, customary practises prevailing in the industry and such factors as the concentration of leasing dates, inefficient contracting methods, incompetent management, specialization and lack of coordination between the slack season and repair work. Recent studies made by the United States Department of Commerce suggest that the difficulties of inclement weather are not so serious as is generally supposed. In fact, weather conditions alone cannot explain why the number of days worked per year in New York City, St. Paul and Montreal with their severe winter weather is about the same as in Los Angeles, San Francisco and New Orleans, although the number of rainy days in the three latter cities is much less than the number of cold days in the former cities. Available data indicate that various methods of scheduling operations, the dovetailing of different trades, the installation of improvements which reduce the effect of cold and rain, all make possible a longer building season. In view of the amount of indoor work necessary the great majority of the workers in the building trade as now organized could be occupied the year around. Peak and dull seasons have been created by customary methods of carrying on building operations, such as that of interior decorating during the summer, a justifiable practise before the advent of heated buildings but one no longer necessary. Thus much unemployment results from the failure of management to adapt itself to new situations and techniques.

These conditions have had serious consequences for all the groups in the industry. Hourly rates become a poor index by which to judge the prosperity of the building worker. Moreover, three months of unemployment per year lead to chronic dissatisfaction with wages, no matter how high the hourly rate may be. Seasonal unemployment has also had a very direct effect upon the efficiency of the building trades. Restriction of output, a rather wide-

spread practise in the industry, is encouraged by the knowledge that a long period of idleness will follow the completion of a job in the fall months. Organized and unorganized workers have therefore adopted practises which seek to stretch out the job for a longer period of time.

The seriousness of these problems has led to considerable effort to provide more regular employment for building trade workers. The labor unions have for a long time proposed the shorter working day and the five-day week as a solution to the problem. More recently the employing groups have undertaken reforms such as increased utilization of technical improvements, better planning in the coordination of repair and new construction jobs and the attempt to maintain a steady working force through the upkeep of a skeleton organization or through pooling of labor supplies. Managerial wastes cannot all be laid to the failure of the contractors as such. The greatest obstacle to efficiency has been the existence of so many entrepreneurial and managerial groups—contractors, subcontractors, financiers, owners, architects, and manufacturers and distributors of material and equipment—whose activities have not until recently been coordinated through any organized body.

In recent years the institutions which supply credit to the building industry have been recognized as influential agencies for stabilization. The most important sources of building credit are building and loan associations, life insurance companies, savings banks, trust companies, national banks, mortgage companies, private investors and surety companies. The 13,000 building and loan associations in the United States with assets of over eight billion dollars offer savings and loan opportunities to twelve million members. Their loans are made in the main to individual builders of homes. Loans made by life insurance companies are for shorter terms and are more closely regulated by law, but since the war such companies have greatly extended their loans for home construction. The savings banks, trust companies and national banks are also heavy investors in mortgages of all sorts, including those on residence buildings. Financing of large apartments, hotels and office buildings has been done mostly by mortgage bond issues, a post-war financing development. The exemption from income tax of interest on local government securities has led to an equally ready supply of funds for public construction.

Although in the period of inflation in 1919

there was some complaint of high cost of financing, obtaining credit for building has not been a serious problem in the United States. On the whole there has been an actual surplus of capital seeking investment possibilities in construction, especially since the passage in 1927 of the McFadden Act, which permits national banks to invest as much as one half of their savings deposits in realty loans for periods up to five years. This situation is of course in sharp contrast to that in European countries, where construction activities have been hampered by a dearth of funds. The surety and bonding companies which underwrite the contracts of builders in the United States have been criticized for not being sufficiently selective in the bonding of questionable contractors. On the other hand, such financing institutions often maintain architectural, engineering and real estate departments to safeguard against unsound building, and twice, in 1906 and in 1925, a group of them reached an agreement to limit loans on construction projects in order to prevent overdevelopment.

A less healthy influence on the industry has been exerted by the owners, consisting of the large group, in the main home builders, who own the completed buildings and the speculative or operative builders who erect for sale. The first group is of minor consequence because of its temporary interest in construction activity and its wide dispersion. But the speculative builder, who erects most of the large city structures, plays an important part in determining conditions in the industry. The operative builder is primarily a real estate investor; he is interested in getting his project completed in the shortest possible time in order to have it ready for the customary renting season. As a result the problems of the industry or of the consumers are not of permanent concern to him and he therefore avoids affiliating with organizations of other entrepreneurs to remove the more unwholesome practises. Only in recent years has the movement to improve competitive practises affected this group; many of the larger operative builders are now active in cooperative movements of building contractors.

The architect and engineer occupy a definitely professional position in the industry. The influence of the architect in restricting competition to reputable contractors and in limiting their number has been of considerable aid in correcting some of the evils which excessive competition has produced. The higher standard of tech-

nical architectural and engineering training necessitated by the new architecture has not only strengthened this tendency but has been reflected in improvements and desirable standardization of design and specifications.

Probably no group within the industry is better organized than the manufacturers and distributors of building materials and equipment. With the aid of government bureaus, especially of the Division of Simplified Practice of the Department of Commerce, considerable standardization of qualities and types of products has been achieved, and delivery and use of materials have been greatly facilitated by the development of the motor truck and by the institution of a system of machinery rental. There has been complaint of excessive prices for building materials, a charge which gains plausibility from the high degree of organization of this group, but the downward trend of prices of materials since 1923 is generally regarded as a sign of a gradual remedying of the situation.

In any stabilization of the construction industry an important part can be played by local, especially municipal, governmental authorities. Through their power to draw up building codes and regulations and their authority to grant permits for construction they can direct in many ways the development of building practices, while in the construction of public buildings they can take the lead in adopting desirable methods. To a certain extent local administrations have made use of these opportunities.

A source of waste which cannot be easily attributed to any single group in the industry is that involved in the high accident rate and in certain branches the high morbidity rate due to industrial poisoning. It has been estimated that \$30,000,000 is expended in the industry annually as compensation for deaths and total and partial disability due to accidents; if viewed in relation to possible accident prevention these accidents can be considered to cause a loss of twelve million working days a year. According to the National Safety Council's estimate of accident frequency and severity in a large number of industries and occupations from 1925 through 1927, both rates are increasing in the construction and are higher there than in any other industry or craft with the possible exception of certain crafts in the extractive industries. In New York State death and total disability rates in the construction group were twice as high as in manufacturing, and the number of cases requiring compensation amounted in 1927

to 20 percent of all cases. A large proportion of these accidents might be prevented through education of all groups within the industry to a recognition of the necessity for safeguards and through enforcement of existing standards of safety set by the state. Less easily preventable are the ailments caused by exposure to changeable weather which are frequent in certain crafts. Moreover, 50 percent of the total number of deaths from lead poisoning in the country are attributable to the painters' crafts, and the morbidity rate from this and other industrial poisons due to materials and processes used in construction continues to be very high. The resistance of unions to certain innovations, such as the spray gun in painting, and their demand for shorter working periods are related to the formulation of a program of lessened exposure to these poisons.

The organized labor groups within the building industry have been subjected to considerable criticism, with reference rather to allegedly unfair working rules, wasteful jurisdictional conflicts and abuse of power or corruption on the part of their leaders than to wage or hour disputes. The hourly rates of building workers are, it is true, higher than those of any other group in industry and the rate of increase has been high as well. This is also true of skilled building workers in the European countries and is in both cases due to the early success and the completeness of unionization as well as to the strategic position of the worker. The local character of the industry has helped to increase the bargaining power of the labor organizations, and the presence of a large number of small and unorganized contractors who are able to shift wage increases to the building owner has prevented any effective opposition to the union demands. In addition, the large volume of building construction since 1923 has given the workers a considerable advantage in any contest involving wage increases.

Hourly wages in the building trades of the United States have increased steadily since 1907; they doubled between 1913 and 1921. The combined index number for all trades in the industry shows a steady upward trend, which was only temporarily checked in 1922; in 1927 it stood at 257, with 1913 as the base. The business depression in 1921 affected building trades wages much less than those of other industries. Even when compared with changes in the cost of living the figures show an improvement in the economic position of the building trades worker;

thus in 1926 the cost of living was approximately 70 percent higher than in 1913, while the building trades hourly wage index was about 150 percent above 1913. The statistics on European building workers' wages made by the International Labour Office in its study of post-war housing conditions would suggest that the rate of increase in their earnings had been almost as high, although of course such figures are not always strictly comparable. Nevertheless, in any consideration of the actual position of the worker it must be remembered that these hourly wage indexes are misleading because of the high rate of seasonal unemployment. The length of the working day has also been reduced during the past two decades. By May, 1929, 66 percent of the painters, 38 percent of the lathers and 65 percent of the plasterers, representing 25 percent of all building workers, had succeeded in establishing the five-day or forty-hour week and 72 percent of all workers in the building trades had a forty-four-hour working week.

It is, however, not the question of wages and hours but rather jurisdictional disputes and problems as to working rules which cause most conflict within the construction industry. The existence of such disputes is to be explained in part by the nature of the industry and the dynamic changes which have taken place in it and in part, especially in the United States, by the circumstances of union history.

As far back as 1824 effective local combinations of building craftsmen were already in existence in the United States, although in England, as a result of the combination acts, building trades unions did not appear until 1832. Then, however, in contrast to the continuing local character of American unions several effective national organizations made their appearance and functioned for many years. The demands of these early unions both in England and in the United States centered primarily about two grievances: wages and hours. The nature of the grievances concerning wages was a result of the position occupied by the middleman contractor who intervened between the worker and the owner. The contractor hired his workmen at stipulated wages, and since he did not purchase his own materials his profits consisted of the difference between the amount he received and the wages he paid. Since wage increases could not readily be shifted to the owner, the worker felt that the lot of the contractor was not much better than his own. In

many localities it was not uncommon for contractors to align themselves with the workers against the merchants who, the contractors stated, "live by working us harder and working us cheap." In the United States, and in Great Britain except in so far as they reflected in their programs the influence of Owenism in the period between 1832 and 1836, the first unions confined themselves mainly to the protection of wages and hours.

In the United States the development of national unions resulted from the growing strength of the local groups, who gradually came to realize the inadequacy of local organization in providing sufficient financial reserves, disciplined membership, stable leadership and control of other than local conditions when confronted with business fluctuations. The formation of national craft unions began in the period preceding the Civil War and, only temporarily arrested by the business depression of 1873-79, proceeded steadily until the end of the century. The stonecutters formed their national union in 1857, the plasterers in 1865, the bricklayers in 1856, the granite cutters in 1877, the carpenters and painters in 1881, the steam fitters in 1888, the plumbers in 1889, the machine woodworkers in 1890, the electrical workers in 1891 and the ironworkers in 1896. Other trades of lesser importance followed in the succeeding years. Before 1900 there was a national union in every organized trade in the building industry of the United States. Since 1900 there has been a steady growth in the membership and influence of the seventeen national unions in the building industry of the United States. From 553,000 in 1913 the membership increased to 1,014,000 in 1927, a gain of 461,000 in slightly more than a decade. In the larger cities of the country the building trades unions have succeeded in what approximates complete organization of the workers in the industry and the percentage of organization for all trades for the country as a whole is about 50 percent. The building trades unions constitute at the present time more than one third of the total membership of the American Federation of Labor. This development of organization on a national scale did much to relieve unfair competition and to overcome abuses of power by local officials as well as to standardize working rules in so far as the great local variation of work permitted. It is interesting to note that the unions of Germany, although troubled with none of the jurisdictional disputes resulting from craft unionism, have

until recently had difficulty in overcoming localism.

The existing national trade unions in England date back to the fifties, the unions of the thirties having failed to persist in the face of adverse conditions. Intermunion controversies have been present among the building unions in England and Germany, although not to such an extent as to result, as in the United States, in internal dissension among the unions and in instability for the industry. Demarcation disputes, as these conflicts of frequent occurrence before the war were known in England, have more recently been looked upon as practises not "in fashion," and the "scabbing" which in the United States frequently accompanies these controversies is in Great Britain regarded as a decidedly unethical trade union practise. The same attitude is found in Germany and there, moreover, the organization of the building trades on an industrial basis has practically ended such controversies.

Under the craft form of trade union organization each variety of work becomes reserved for members of one particular union. When a worker attains skill at a particular specialized trade he regards this as his property and will fight stubbornly against trespassing upon his vested right. Moreover, each trade has a deep conviction that the amount of work is limited. The rapid technical changes which have characterized the construction industry in the United States have clouded the boundary lines between the work of one trade and that of another. As a result disputes between conflicting unions have accounted for 75 percent of the strikes in the building trades. Employers, workers and the building public have long complained against the inability of organized labor to find a method of settling these controversies without resort to direct action.

The introduction of new building materials has been one of the most potent causes for jurisdictional controversies. The introduction of metal trim, metal doors and windows, shingles and similar products has threatened to reduce the amount of work available for the carpenter. Steel and concrete have further cut down the woodworker's job and forced the carpenters' union into an aggressive fight to protect its claims against rival organizations. The bricklayer has had to meet the competition of concrete, tile, plaster block and other substitutes. An equally effective cause has been the introduction of machinery. The production of wood products in

factories deprived the outside carpenters of much work they had formerly done and flooded the trade with "saw and hatchet" men from the mills who displaced the skilled carpenters on the job. A costly struggle between the carpenters' union and the woodworkers' union for control over machine woodworkers, which lasted over twenty years, was finally settled by an amalgamation agreement. The plumbers and steam fitters disputed their rival claims for nearly two decades. No organization in the building industry has been free from these disputes.

Because of their number and importance the search for a solution of jurisdictional disputes has been a pressing problem. There have been two main methods of approach. One has sought to utilize the trade unions themselves to this purpose, first, by referring disputes between national unions to the American Federation of Labor, which, however, has failed to mediate successfully because of the power of the autonomous national unions; and, secondly, by the encouragement of the formation of local, state and national councils of allied building trades, which have been fostered also because of the need for more effective collective action in relations between employer and employee. The second approach has concerned itself with the setting up of local and national arbitration councils comprising representatives of all interested groups, including the public.

Building trades councils of the various unions have been organized in most of the larger cities of the country; in New York, Chicago and San Francisco they were powerful bodies even before 1900. While such local and national councils represent a movement in the direction of industrial unionism, the affiliated organizations still possess a large measure of craft autonomy. The existence of these councils has greatly strengthened the bargaining power of the building trades unions. In many of the larger cities the council has complete control over the labor situation, makes or underwrites the trade agreement, settles disputes between unions and through the use of the sympathetic strike has greatly solidified the ranks of the building workers. The national organizations have also sought some form of national federation which would facilitate closer cooperation, particularly in the prevention of jurisdictional disputes. With that end in view the National Building Trades Council was formed in 1897; failure to secure the cooperation of the American Federation of Labor thwarted its progress and

in 1904 it was succeeded by the Structural Building Trades Alliance, the success of which was blocked by the unwillingness of the smaller organizations to affiliate.

The need for federation of building unions throughout the entire industry finally led the American Federation of Labor to sponsor in 1908 the organization of the Building Trades Department, the primary purpose of which was to provide an agency to settle disputes between the separate building unions. Its effectiveness has been curtailed by the unwillingness of the Brotherhood of Carpenters to follow the decisions of the department where its own claims were involved. For a long time over 40 percent of the department's membership belonged to the Brotherhood of Carpenters; the remaining 60 percent was divided among the other seventeen or eighteen organizations. Had all the unions been of approximately the same size, no one of them would have dared to brook the united opposition of all the others. On the other hand, the movement toward amalgamation of related crafts which was endorsed by the 1912 convention of the Building Trades Department has decreased the number of jurisdictional disputes and has resulted in a broadening of the basis of organization. The bricklayers' union, for instance, now controls not only bricklaying but also stone masonry, marble work, tile settings and in many localities plastering. In a similar way the larger unions in the industry have been absorbing the smaller related trades, and a number of large dual unions have been eliminated. The movement has not, however, been sufficiently rapid or comprehensive to do away with jurisdictional disputes.

Voluntary arbitration of disputes was experimented with on a local scale prior to the World War. Arbitration boards dealing with all types of labor disputes existed in New York, Chicago and other large cities and in some localities achieved considerable success. But such success was possible only if both the workers and the employers were thoroughly organized and if the national unions did not oppose local decisions, and neither of these conditions existed. When contesting national unions failed to agree appeal was made to the American Federation of Labor, usually unsuccessfully, since the federation lacked power in dealing with autonomous national unions. Twenty years of experimentation along these lines finally led to a new approach immediately after the war. Contractors, architects, engineers and other groups were in-

vited to aid in establishing an adjustment agency and to participate in its proceedings. The National Board for Jurisdictional Awards was organized in March, 1919, with specific power limited to the adjudication of jurisdictional disputes. Any interested party, labor, employers, manufacturers or architects, could present evidence to it, and strikes pending its decisions were prohibited. Each signatory to the agreement establishing the board obligated himself not to participate in sympathetic strikes arising out of jurisdictional disputes. National unions, architects' associations and other participating groups pledged themselves to discipline affiliated members who failed to comply with the awards of the board. It appeared that an effective organization with power to enforce its awards had been perfected.

In the first year the activities of the board met the expectations of its supporters. Over two dozen controversies, some of them of many years' standing, were promptly settled. In seven years the board rendered over one hundred decisions, a great majority of which were accepted, saving the industry many millions in construction costs; and it has been estimated that jurisdictional disputes have been reduced 80 percent since its organization. But the inherent weaknesses of the arrangement soon came to the front. Friction arose with the Brotherhood of Carpenters almost from the beginning, and in 1920, anticipating an unfavorable award, they withdrew from the board, which was thus left to operate without the cooperation and support of the largest union in the industry. Their absence and the repeated failure to secure their reaffiliation greatly weakened the effectiveness of the adjudicating machinery. In addition, several local groups, particularly in New York City, refused to discard their local adjustment machinery. Architects' and contractors' organizations were either unable or unwilling to support the board's awards to the extent of expelling disobedient members. Added to these difficulties the persistent opposition of the carpenters weakened the support of other labor leaders. In 1927 the Building Trades Department of the American Federation of Labor withdrew from the Board of Awards. In June, 1930, a new organization, known as the Board of Trade Claims, was established; it differs little in structure or aims from the old Board of Awards but at present includes all unions within its membership.

Another frequent source of friction and there-

fore of waste has been the disputes over the working rules imposed by the unions. These rules are primarily a reaction of the union to the insecurity of the job which results from dynamic changes in the industry, and they attempt to check the rate of introduction of changes in order to protect wages, hours and working conditions. They are designed to maintain wage standards and to prevent speeding up which would lead to unemployment, regulating the supply of labor through entrance and apprenticeship limitations and the prohibition against employers working on the job. They further limit the authority of the management by provisions restricting the increase of specialization as it applies to the subcontracting system, preventing the transference to the shop of work normally done on the job, forbidding the use of unskilled workers on tasks classified as skilled, restricting the use of building materials manufactured under non-union conditions, asserting some control over the quality of workmanship, limiting the employer's right to "hire and fire" and preventing non-union men from working at the trade.

Of these rules the closed shop and the regulation of apprentices have evoked the greatest opposition. In 1926, 69 percent of all construction work was done under closed shop conditions. This figure represents an average for the country as a whole, and in the larger cities closed shop operations are even more extensive. The unions' insistence on the closed shop has been due to the fear that without it the cut-throat competition of the subcontracting system in this industry, in which wages are a major item in total costs, would result in the employment of low paid non-union workers. Moreover, union experience showed that under open shop conditions control was made practically impossible by the large number of contractors, the limited duration of any building project and the wide scattering of projects throughout the country. But since the closed shop equalizes competition among contractors, thus bringing stability and lower costs, it has evoked less opposition in the building trades than in other industries.

The rules regulating the employment and training of apprentices have also been of considerable importance. The apprenticeship system was most highly developed in the guild organizations of the pre-industrial era. It still is found, although in somewhat modified form, in England, France and Germany, where it is enforced by union regulations. In the United

States only the more skilled crafts seek to provide genuine training through apprenticeship, but most unions have fairly extensive regulations on entrance to the trade.

The most common restriction is a limitation on the age of apprentices, with the upper age limit usually placed at eighteen, although some unions admit apprentices up to twenty-four years. The lower limit is usually at sixteen years. The training period is also regulated; four years are required for the more skilled trades and two to three years for those not so skilled. Some unions also limit the number of apprentices allowed to each employer or in each shop; others determine the number allowed in relation to the number of journeymen employed. A host of other rules have to do with the kind of training the apprentice is to receive, the tools he is to use and the wages he is to be paid.

Many employers maintain that these regulations have made the employment of apprentices unprofitable and have therefore at times created a shortage of skilled mechanics. For some of the trades the census of 1920 showed an actual decrease from 1910 in the number of apprentices; for others it showed an increase not sufficient to keep pace with the increase in population. But other factors than union restrictions explain this decrease in the ratio of apprentices to skilled building mechanics. Modern construction methods do not lend themselves to the older individual methods of training young boys. On most large buildings, because of both speed requirements and high hourly rates, contractors refuse to employ novices; and the burden of post-school training has fallen increasingly on the small or often on the highly specialized contractor. It has been said that English employers are equally reluctant to hire apprentices and that the ranks of English skilled building labor have been filled by foreign craftsmen.

The trade school as a place in which to teach young workers became popular with the building tradesmen after 1880. The determined opposition of the unions to these trade schools, evidently motivated by fear that they would infringe on craft skills and controls, led after 1900 to the regular inclusion in the collective agreement of a stipulation for union control of apprentice training. At the present time about one sixth of the trade agreements in the building industry of the United States provide for the administration of apprenticeship by a joint committee, a joint arbitration board or a building congress consisting of all groups in the

industry. In many open shop cities employer control of apprentice training has developed.

In New York City many of the disputes arising from union apprentice regulation have been adjusted through the Apprenticeship Commission Plan initiated by the New York Building Congress in 1920. This commission is an advisory body, composed of representatives of the building unions, the employers and the congress. It makes surveys to determine the needs of the trade, develops the general principles for training and supervises the training program. The principles which it has laid down include thorough training in all branches of the trade, combination of job work with compulsory school attendance and indenture of the apprentice to the commission instead of to the employer. The actual training is in charge of joint committees in each trade, which determine the detailed rules for each craft.

While such provisions as these, embodied in written or verbal agreements, have aroused opposition, the charges against the union of unfair practises have perhaps resulted more often from the unfair enforcement of rules by the union official, the business agent or, as he was previously known, the walking delegate. As a result of the subcontracting system, the dynamic nature of the industry and the increasing number, importance and complexity of union rules, constant vigilance and immediate action have been necessary to protect union conditions. The power to call strikes has therefore been in most cases vested in the business agent alone. This power and that of dispensing jobs make the good will of the business agent of importance to the worker as well as to the employer and give him immense control over the industry's operations.

Considerable evidence has been accumulated through legislative investigations in several of the states, which indicates that this power has been abused and that graft and corruption have been associated with it. Frequently the general indifference of the membership permits the continuance of these practises, and opposition to the entrenched political machine of the business agent is difficult to secure. Contractors are often willing to buy "strike insurance" or protection against other labor disturbances, and the payment of graft is often the cheapest and easiest way for them to have the union official overlook violation of union rules. The cost plus method of building construction makes it relatively easy to pass all increases in cost on to the building owner. Nor is the owner in a position to permit

the demand for graft, under whatever form it is levied, to delay the completion of the structure. The amount involved is a much smaller addition to the total cost of the project than would be incurred by the delay in completing it which might follow a refusal to contribute. These conditions, psychological and economic, help to explain the existence of unethical practises in the building trades.

It must be noted, however, that the discussion concerning graft does not apply to the vast majority of the labor leaders or of the employers in the industry. The extension of the influence of the national unions, of employers' organizations and of the trade associations, with the resultant emphasis on codes of ethics, is tending to decrease the extent of unethical practises.

The organization of contractors as employers has in all countries somewhat tardily followed the organization of labor. After many years of trial British employers are now federated into effective national and district associations. In the United States such obstacles as the large and shifting numbers in the ranks of contractors in the various trades, the small amount of capital required to enter contracting, the indifference of the average building owner to the contractors' problems and his lack of interest in industrial relations have all retarded the development of strong building trades employers' associations.

In some localities, however, contractors' organizations strong enough to counteract the power of the labor unions have long been in existence. The first modern associations of builders were the builders' exchanges, formed in the eighties and nineties of the last century. Their interest in labor problems, however, was only secondary to their concern with competitive practises. About the same time contractors were forming associations, which were limited to the members of one trade, to meet the problems arising out of the organization of unions, and after 1900 in many localities such organizations represented the employer in dealing with the labor unions and in negotiating the annual agreement. As the unions federated into city wide building trades councils, the employers in many cities formed federated building trades employers' associations, particularly in the period after 1900. Some of these associations, particularly those in New York, Chicago and Cleveland, have conducted joint relations with the unions for over twenty-five years and have succeeded in stabilizing industrial relations in their communities.

During the same period the building industry began to outgrow its local environment, and large contracting firms with operations extending from coast to coast were organized. Contractors found it necessary to combine on a national basis comparable to the national labor organizations. National associations of building trade employers now extend to every trade in the industry. These concentrate attention primarily on trade practises, only incidentally considering questions of labor relations. Others, like the National Erectors' Association, one of the most aggressive employers' associations in the building industry, have been organized primarily to deal with labor problems. The National Building Trade Employers' Association, a federation of national trade associations of employers, is mainly concerned with molding employers' opinion on vital questions of labor relations.

It was the organization of employers' associations which facilitated the introduction of voluntary arbitration as a method of settling labor disputes. The agreement between the mason contractors and the bricklayers' union in New York in 1884 was the first arbitration contract in the building industry of the United States. Arbitration in other trades made slow headway for many years. The General Arbitration Board established for the building industry in New York City in 1903 was the first adjustment agency to govern all the trades in a city. Trade arbitration boards were set up in each of the thirty-three crafts in the city, to adjudicate problems involving only the workers and employers in the trade involved. Appeal was had to the General Arbitration Board when the dispute involved more than one craft or when the trade board failed to agree. With some modifications in 1903, 1905 and 1919 this system has governed over 150,000 workers and their employers in the largest building center of the United States.

The principle of arbitration has been extended to other cities and produced stable adjustment machinery. Arbitration committees were organized in Chicago soon after the long strike of 1900, and in 1916 the Joint Conference Board, a supertrade arbitration body, was established to settle grievances and disputes whenever the arbitration committees failed to agree. The code of industrial government which is being developed by these adjustment boards, now functioning in many cities of the country, is slowly bringing about a reliance upon the method of adjudication in preference to direct action. Standards for wage adjustment, working

conditions and hours of labor, by-products of every decision of an arbitration tribunal, tend to remove the uncertainty and instability which characterized these problems in the past.

Industrial cooperation between not only the workers and their employers but all the groups operating in the industry first developed out of the post-war industrial situation. In the United States it found its first expression in the organization in 1919 of the National Board for Jurisdictional Awards already described. An even more important manifestation of the trend is to be seen in the building congress movement. Local building congresses, the membership of which includes architects, engineers, general contractors, subcontractors, manufacturers and distributors of material and equipment, financial and real estate, labor and employers' organizations and similar associations have been organized in New York, Boston, Philadelphia, Portland and several other cities. In each locality the driving force behind the organization of the building congress has been some special problem pressing for correction. In New York City, for example, the particular issue was the training of apprentices. From this task and the fact of association new activities were undertaken. Purely trade matters, questions of wages, hours and conditions of work and specific trade practises were left to the trade organizations and the unions in the respective trades.

The activities of building congresses have been varied. Apprenticeship training, stabilization of employment, recognition of craftsmanship, commercial arbitration and codes of ethics have been the more important issues dealt with by the various building congresses. By discovering through systematic surveys the needs of the public and the industry, by finding and recommending ways and means for satisfying these needs, the building congress has made a distinct contribution toward the solution of the problems and toward the technique of cooperation in industry. The greatest benefits of the movement come not so much from its actual and direct results as from the degree of understanding which it fosters among different groups.

On a national scale the building congress idea of cooperation has found expression in the American Construction Council, organized in 1922, which includes, besides all groups in the industry, representatives of chambers of commerce or boards of trade, of public utility construction departments, of federal, state, county and municipal departments concerned with con-

struction. Many problems needing solution could be handled only through a national organization. The council became a national clearing house of information on the construction industry; an association of associations representing all the groups private and public functioning in the industry. It has made an effort to mold the opinion of the construction industry on several problems of national importance. It issues a periodical report on developments in the industry, particularly in regard to volume of construction. These reports seek to check the possibility of overexpansion and to stress the need for stabilization.

Close public cooperation with these groups has been facilitated by the creation of the Division of Building and Housing within the Department of Commerce. This division gave valuable suggestions during the depression of 1920-21 and has made available statistics regarding all phases of building activity.

In England, in Germany and to some extent in other European countries since the war co-operation within the industry or in conjunction with government has taken somewhat different forms. In most countries of continental Europe cooperative housing and government aid to home building have played a considerable role for some time. The post-war building situation in all these countries was exceedingly acute, particularly with regard to housing. In Great Britain a Building Trades Parliament of employers and operatives was formed as early as 1915 partly as a result of pre-war conciliation schemes and in an attempt to find a method of overcoming demarcation disputes. In 1919-20 a committee of this parliament produced a plan signed by a number of employers as well as leading trade unionists for the drastic reorganization of the industry. The program adopted went far beyond the provisions of an ordinary trade agreement. It not only sought to secure the regularization of production and employment, the maintenance of real wages and the settlement of general principles governing the conditions of employment but considered also questions of scientific management and reduction of costs, the promotion of research and the study of processes, designs and standards of workmanship. The combined energies of the employers and the workers were to be directed upon the continuous and progressive improvement of the industry. In 1920 a committee from this parliament drafted a report for a National Building Guild. Under this plan the employer was to be-

come virtually a salaried servant and the industry, hiring its capital at interest, was to be conducted in partnership by its managers and operatives.

While this movement did not carry the endorsement of the main body of employers it aroused considerable enthusiasm in the minds of the workers. Under the leadership of Malcolm Sparkes, an employer and one of the originators of the Building Trades Parliament, building guilds were organized in London and Manchester in 1920. The movement spread rapidly and local building guilds were organized all over the country. In 1921 most of these local groups came together to form the National Building Guild.

The movement achieved rapid success almost from the start. The acute housing shortage was responsible for a governmental policy of encouraging guild operations. The government consented to the employment of the new guilds by local authorities; the use of the basic-sum form of contract gave them an added advantage; the assurance of weekly payments made possible operation with little capital; and adequate credit was available through the strength of the co-operative movement, which was favorable to the guilds. As a result work to a value of over £2,000,000 was taken in hand. Unfortunately the guilds did not count on a change in the governmental housing policies. In 1922 the government withdrew its support; this action, combined with the shortage of capital and the inefficiency and slackness of discipline due to local autonomy, soon brought about the failure of the National Building Guild. This in its turn resulted in the failure of local guilds, many of which had been in excellent financial condition. The continuing influence of the building guild movement is probably to be seen, however, in the adoption of new methods of national scope for dealing with many of the problems of the industry.

In Germany too the post-war situation brought about the formation of building guilds on a somewhat more stable foundation than the British guilds. The movement began in 1919. The ideal of the German guild, like that of the English, was socialistic, but the propaganda element was less stressed and more attention was given to developing the guilds into efficient producing units, competing with profit seeking capitalistic organizations. To this end the methods of scientific management and cost accounting were employed to raise the level of

guild efficiency. Responsibility for the job rests entirely with the local bodies, but the national organizations have a degree of control over funds. The guilds were pioneers in introducing American machine methods, especially in an attempt to foster winter construction. After a slow but consistent growth, in 1928 there were in existence 138 local guilds employing 16,828 workers. Over 50,000 well built homes have been erected by them.

The relative importance of these two experiments in the entire European construction industry is difficult to estimate, especially from a statistical point of view. There is probably less statistical information available concerning this industry, its workers, the value of its output and the like than there is concerning any other major industry of the various European countries, in spite of the fact that such scant and often not comparable data as are available show its importance. According to a recent estimate by Woytinsky in his *Die Welt in Zahlen* the four construction industries of the principal countries of western Europe, Germany, Great Britain, France and Italy, employ about three and a half million workers. They probably comprise 6.5 percent of the total working population and about 14 percent of the total number of industrial workers, which makes their relative importance only slightly less than that of the American industry. The total number of workers for all of Europe is estimated at between five and six million. In most of the European countries these workers display a high degree of unionization and are in most instances organized into highly effective industrial unions little disturbed by the jurisdictional disputes of the American craft organizations. Some indication of their strength is given by the following figures for the various countries and for the international organizations. The Building Workers' International, organized in 1903 and one of the larger groups in the International Federation of Trade Unions at Amsterdam, showed a membership in 1923 of 1,144,000 workers, with a successive decline for 1924 and 1925. Building workers affiliated with the painters' and stone-masons' internationals, separately organized, probably bring the total to a million for 1925. The Christian Labor International in 1921 claimed a membership of 98,000 building workers. The Russian trade unions which are affiliated with the Profintern or communist trade union international included an average membership of about 300,000 for the period between

1920 and 1925. Germany's building federation numbered 431,000 workers in 1924 and with additional groups from industrial unions of slightly conflicting jurisdiction probably rose to 500,000. The membership of the British unions rose to a high point in 1920 with 557,000, but because of the acute national unemployment situation has dropped to 356,000. Building trades unions in France—scattered in hundreds of locals—included a membership of 146,000 in 1920. Italy's trade union membership was only slightly lower.

Recently considerable interest in the problems of this industry has been aroused. The same forces which have brought about the organization of the building industry of each country on a national scale have tended also to foster international organization in Europe. Until the war construction everywhere was largely a localized industry, very rarely of national scope except in the field of public works and public utilities construction. It is this new development which has probably led to such studies as that recently made of unemployment and wage rates in the various European countries by the International Labour Office of the League of Nations. Organization of entrepreneurial groups on a national and international scale has been given an added impetus. To an increasing extent professional associations in the various countries, often with government encouragement, are sending commissions to study the techniques and methods of organization of the industry in other countries. At its fifth meeting this year the International Congress of Building and Public Works dwelt especially on some of the problems which were common to European countries, such as the need for rationalization, for standardization of contract forms, of designs, materials, problems of financial and credit facilities, of apprenticeship and safety, and stressed the necessity for cooperative effort.

CONSULAR SERVICE. A consul is an officer commissioned by a state and authorized by the grant of an *evequatur* from the receiving state to watch over the interests of the sending state and of its nationals within a particular locality or district. As soon as any extensive commerce between independent communities developed, the need of some kind of intermediary or protector known to the local authorities was felt. Throughout the ancient world trading groups in foreign cities took various means of securing resident representatives of their interests. In the cities of Greece a *proxenus*, or patron, assumed this responsibility for the merchants from a particular city. Probably many early analogies might be found for the practise, which became common with the increase of commerce among the city-states of the Mediterranean after the crusades, of colonies of foreign merchants electing one of their number to protect their interests and to represent them before the local authorities.

The evident advantage of protecting this growing commerce and using these magistrates as foreign representatives and agents influenced the newly developing European states of the fifteenth and sixteenth centuries to send to important trading centers so-called consuls of outremer, who as regular officers of the sending state soon replaced their unofficial prototypes. Before the rise of the great nationalist states, jealous of every infringement of their sovereignty, consuls exercised jurisdiction over their countrymen. This jurisdiction was necessarily most complete in states like Turkey where the legal system was not intended to apply to infidels, whose privileges were made to rest upon treaty stipulations or capitulations. Vestiges of this so-called extraterritoriality now remain in a few backward states only. In general the consular

service of all the different states, based largely upon the French model, has become nearly uniform. Although in the course of this development the consul's jurisdiction and prerogatives have been curtailed by reason of the jealousy of the states of any infringement of their sovereignty, increasing international intercourse and the tendency toward centralization of governmental control have made his position of ever greater importance.

Since the primary duty of a consul is to protect his nationals from injustice, it is not correct to speak of him as a commercial agent. Although it is true that in the more civilized communities he is rarely required to protect his nationals from outrage and that he is more frequently concerned with their commercial interests, a consul is nevertheless in a more specialized sense than the diplomat a representative or political agent of his government. A consul's actual duties necessarily vary according to the nature of his post and the relations between the two states. In order to facilitate the protection of his nationals it is customary for a consul to maintain a *register* where they may record their names. When nationals die in a consul's district without heirs or partners to look out for their personal estates, he seeks to prevent loss and to preserve the assets for the absent heirs. He protects in general the interests of absent nationals and his interposition is also most valuable in the case of minors or incapable nationals.

Other duties which a consul may be called upon to perform include the authentication of signatures, the issuance of various certificates of fact and the performance of appropriate notarial acts at the request of nationals or others who may have need of these documents relative to transactions in the sending state or with its nationals. The care of seamen and shipping under the national flag is another important duty of the consul; he must also make the necessary quarantine inspections of vessels bound for his state. Another consular duty is to visa the passports of travelers who wish to visit his state. Because of the adoption by the United States of a policy of restriction of immigration United States consuls in the principal ports of Europe are required to make careful investigation of applicants who are desirous of entering the United States before they accord the necessary visas.

In connection with his commercial activities the consul is concerned with facilitating commercial exchanges and in aiding his countrymen

to take advantage of trade opportunities which arise in his district. This function is becoming of increasing importance. A consul may not properly participate directly in trade promotion or push the sale of a particular article, although the keenness of economic competition between states and the movement toward a closer relation between governments and business tend to exert an influence in this direction. Every consul is, however, frequently called upon for answers to trade inquiries, and one of his duties is the preparation of periodical trade reports. Consuls of the United States, for instance, transmit such reports to the Department of Commerce, which publishes those of public or general interest in its weekly *Commerce Reports*.

Consuls in the principal trade centers receive assistance from unofficial local agencies, such as chambers of commerce, composed of the merchants of the consuls' nationality. Although it is difficult to establish the direct practical value of this cooperation, indirectly these chambers of commerce are of undoubted value as a moral support to the consul and to the merchant body.

In order more effectively to watch over trade interests certain states have appointed in addition to consuls commercial attachés and other officers especially concerned with the promotion of international commerce. Commercial attachés have generally been given a diplomatic status in order that they might have more extensive immunities and be able to act throughout the entire country, which the consul is not able to do because of the accepted practise that prevents his communicating directly with the central authorities. In the United States commercial attachés come under the direction of the Department of Commerce, but like all foreign agents they are when abroad under the supervision of the head of the diplomatic mission. Other departments, such as the agricultural and the treasury, also appoint attachés or foreign agents for special purposes. Treasury agents, for example, assist consuls in performing duties connected with the administration of the tariff laws. All these officials may be considered to perform duties which appertain to the consular office. Their existence is but a manifestation in our foreign service of the modern trend toward specialization which is found in every department of government.

In order that they may effectively discharge their various duties consuls enjoy certain immunities as established by international law or as recognized by local customs. In many in-

stances general consular immunities are confirmed by treaties which also accord such special immunities as are considered useful or necessary. Consuls are subject to the civil and criminal jurisdiction of the receiving state, but in the exercise of this jurisdiction the local authorities must be careful to show due consideration for the consul as an important official of a friendly state. Any interference with his communications to his government and nationals must be avoided. Above all it is recognized as essential that his archives remain inviolate.

The consul as an officer of the sending state is guided and controlled in the exercise of his functions by his instructions, but he may not perform any act contrary to the will of the receiving state. His authorization to act in an official capacity within its jurisdiction can evidently be continued only so long as the receiving state is willing. But although the consul's exequatur may be revoked at any time, this serious step is rarely taken without explanation and an effort to secure the acquiescence of the sending state to a transfer. In some instances, such as war or military occupation of foreign territory, all consuls are withdrawn. The acts which a consul performs in the discharge of his official duties when within the scope of his powers may not be examined by authorities of the receiving state, but the latter reserves the right to decide whether any act is or is not official. In case of dispute such a matter is settled through the diplomatic channel.

In order to meet the needs of governmental organization and control a hierarchy of consular offices has been set up in most countries. Consular officers are generally graded as consuls general, consuls, vice consuls, consular agents and, in certain countries, language officers. Those consuls who are permanent officers are known as professional consuls or consuls of career. At important consulates there may be stationed several consular officers of different grades as well as one or more consular clerks who need not necessarily be citizens of the sending state. In localities of less importance it is customary to appoint a local merchant as a consular agent to discharge certain of the duties of a consul, such as the certifying of invoices. These trading consuls or commercial consuls, as they are also designated, receive their compensation through fees. The honor which attaches to the office of consul is often an inducement to accept the appointment. Some countries, as, for example, France, occasionally confer the title of

honorary consul, conveying with it neither salary nor duties.

The size of modern consular staffs makes necessary some administrative centralization of the system. Consuls general in foreign capitals usually exercise certain supervisory powers over the conduct of consular officers in their areas, and the efficiency of the consular service is greatly promoted through the periodical visits of consular inspectors, who hold the rank of consuls general at large. The United States law requires that consular offices be inspected at least once every two years, and the inspector has power in case of necessity to authorize the suspension of the consul or consul general and administer the duties of the office for a period not exceeding ninety days. It is of importance that the reports of such inspection affect the consular officer's efficiency record, upon which his promotion depends. But the visits are undertaken not for the purpose of inquisitorial investigation but in order better to coordinate the service.

In the United States the foreign service in both its consular and diplomatic branches was for many years a field of exploitation for politicians and *ne'er-do-wells*, and few of those consuls who possessed native ability remained long enough in the service to acquire any real efficiency. Public opinion was aroused by agitation for civil service reform led by the National Civil Service Reform League and some improvement was introduced through an executive order of President Roosevelt of June 27, 1906, and one of President Taft of November 26, 1909. But not until the passage of the Rogers Act of May 24, 1924, was the foreign service permanently placed upon a merit basis and its two branches united. Diplomatic secretaries and consuls are now commissioned as foreign service officers and classified in nine grades according to their salary. All new appointments, however, are made to the grade of foreign service officer unclassified, and through promotion the highest salary grade and rank may eventually be reached.

The consolidation of the two branches of foreign service is not peculiar to the United States. As early as 1883 France combined the two services and the tendency away from the traditional separation has been manifested more recently by other states, including Germany, Austria, Norway and Sweden. Logic and experience have shown that the consular service cannot be entirely divorced from the diplomatic. Since the consul in his limited sphere also acts as

a political agent of his government he should always be in close touch with the diplomatic representative. The cooperation of consuls is invaluable to the diplomat in enabling him to understand the situation in the receiving state as a whole.

CONSUMER PROTECTION. In the more primitive stages of commercial economy, when most manufacture was carried on in small local units and the domestic arts still supplied a large proportion of consumption goods, protection of the consumer was a relatively simple matter. It depended primarily upon the shrewdness of the individual purchaser. Women had a first hand knowledge of the quality of foods and fabrics; livestock was bred and traded locally; clothing and shoes were produced in the home by traveling artisans; men understood woods and the art of making furniture, tools and conveyances; houses were built to order under the eye of the owner. Manufacturers, artisans and merchants had to live by a local reputation for fair dealing.

With the introduction of more efficient power

and machinery into manufacture and with the development of rail and water transportation, accompanied by the widening of markets, control by the consumer over the quality and prices of the goods and services offered him was progressively diminished. Fewer and fewer products were made in the home or the local mill or shop. The variety of goods offered for sale was increased to such an extent that no one person could be expert in judging them all. The purchaser had neither time nor opportunity to compare qualities and prices throughout the whole range of markets and competitive merchants. The arts of production became so complex and were so far removed from the experience of most individuals that it was impossible easily to recognize merit in the product except as mere appearance before use might constitute the desired quality. The art of analyzing the quality of consumption goods has advanced to a stage of expertness which the individual consumer has never had the skill or the facilities to exercise, although it may be effectively employed by professional buyers. Modern technology enhances the possibilities of high quality and low cost, but it also widens the range of possible choice before the consumer and increases the margin of his incapacity to employ the best available techniques of choice.

Cheating and deceit are as old as trade itself, but the weakened status of the consumer in the modern economic structure leaves him a prey to more forms of crude cheating than formerly. The crudest types of cheating are the use of short weights and measures, the adulteration of products and the misrepresentation of the article for sale. All these forms still survive: scales are discovered which give light weight; some gasoline pumps deliver fewer gallons than the motorist orders; patent medicines and tooth pastes are commonly advertised as cures for diseases which they cannot affect beneficially.

Modern business methods have greatly increased the hazard of the consumer by introducing new and subtle forms of deceit. Instead of buying groceries in bulk and running the risk only of outright short measure the consumer is persuaded to buy them in packages assumed to be equivalent to the old measures but which in fact often give smaller quantities for higher prices. Usually there is no legal cheating involved: the amount of contents of the package or can may be printed on the label. But the highly developed arts of advertising and salesmanship accustom the consumer to buy the

package without any measured recognition of the cost of its added convenience. Similarly, by playing upon fear, envy or the sex instinct these arts persuade consumers to pay premium prices for articles proclaimed but not proved to be superior to competitive articles. Where the quality of an article is readily revealed by the experience of the individual purchaser, a worthless article will eventually lose any large market created for it by advertising alone. But the value of many articles cannot be so judged; a laboratory test may be needed to reveal their true serviceability. When all competing products are serviceable to some degree, there is no assurance that the most serviceable will win favor over its competitors.

The increased disadvantage of the consumer in the face of modern business methods is due not so much to wider opportunities for deliberate cheating as to the unregulated system of production for profit. The manufacturer of consumption goods produces for the market rather than for an identifiable individual consumer; he tries to produce what will make the most profit, either through large sales or through wide profit margin. The easiest way to make a profit is not to wait until consumers evince a demand for a product but to devise something for which a demand can quickly be created by advertising its real or fancied excellence. Were consumers universal experts in choice, this might lead merely to rapid improvement and cheapening of goods. Actually, not only does the initiative rest with the manufacturer and his sales force but the survival of the manufacturer is conditioned by the ignorance and suggestibility of the isolated consumers. If attractive color rather than durability leads to salability, the producer will use the resources of science to discover more popular colors rather than to increase durability. Competitive manufacturers may often be as ignorant of the relative qualities of their products, judged by scientific tests of good service, as are average individual consumers. A producer offering inferior products at higher prices may be guilty not of calculated fraud but of following the most easily stimulated preferences of poorly informed purchasers or of employing the most effective trick of stimulation.

The perils of crude cheating have been recognized for centuries. Standardization of weights and measures has long been a practise of governments, and attempts to enforce the use of honest weighing and measuring devices by law are of long standing. In early English law assizes set

maximum prices of commonly used products, and in all countries regulations of mediaeval guilds helped to maintain the quality of goods and the fair price. Later came efforts to assure purity of foods and drugs by law.

The new perils accompanying modern developments of industry and business have received recognition only within a comparatively few years. The principle of *caveat emptor*, an outgrowth of the more primitive order when the consumer could better protect himself, although still generally in effect has been in part superseded either in law or in practise by numerous types of protection. Of these perhaps the most obvious are government regulations of foods, drugs and similar products of mass consumption. The purity and quality of commonly used foods are frequently regulated by local health officials. Inspection of dairy herds and dairies, pasteurizing and grading of milk are now common. National and local laws to protect the consumer against harmful, diseased, adulterated or misrepresented drugs and foods are also quite common. However, they are difficult to administer with anything like complete effectiveness; moreover, some of them prescribe merely truthful labeling and thus do not prohibit untruthful or misleading advertising. Grading of foods for quality, a practise frequently optional with the producer, allows the consumer to discriminate among superior and inferior qualities of such products as beef, turkeys, eggs, butter, cheese, some canned products, fruits and vegetables. This practise is far from universal but is gaining ground.

Regulation of prices by governmental agencies, carried on extensively during emergencies like war, is at present virtually unknown under normal conditions, except for the narrow range of goods and services produced by government monopolies or by railroads, public utilities and similar natural monopolies operated by private capital. In the latter case the amount and quality of service are also subject to government regulation.

Consumers benefit indirectly also from such improvements in the ethical standards of doing business as may be effected by business men as a matter of self-protection. Ethical codes, voluntarily adopted by professional men, trade associations and publications carrying advertising offer a somewhat intangible protection of widely varying effectiveness, but usually operative only to the degree that it serves the interest of the producers or distributors adopting the

codes. Government agencies sometimes cooperate in the drafting of such codes. The range of effectiveness of "better business bureaus," non-governmental organizations aiming to detect and expose fraud and to encourage ethical practises as these are understood in ordinary business relationships, is somewhat similar. In the United States the Federal Trade Commission supplements private efforts in attempting to prevent "unfair methods of competition" in the form of misbranding, misrepresentation, untruthful labeling and substitution. This activity is undertaken to protect not the consumer but the producer who has developed a proprietary trade name or a good reputation and it operates usually only on complaint of the aggrieved competitor.

The industrial standardization movement, which is of considerable and growing importance in industry, also offers some advantages to the consumer. The standardization movement originated in the establishment of the fundamental units of measurement and was eventually developed to include standards of nomenclature, of size and form, of quality, of practise and of methods of test. Unlike simplified practise true standardization is often preceded by research to discover the best way or ways of doing a thing within the economic limits of the situation and is effectuated by general willingness of producers and of important consumers to concentrate their production and purchases on the standard. It tends to eliminate unnecessary styles and varieties and to relieve confusion of meaning as between buyer and seller; it substitutes scientific knowledge for commercial mystification and makes possible price comparisons for identical qualities. The final consumer obtains benefit from industrial standardization of articles in general use through assurance of quality and enhanced convenience. He may also obtain the benefits of lower price made possible by reduced costs, but this result is by no means certain. Standardization lags far behind in consumption goods and has made most progress in intermediate products and in such consumption goods as are bought also in large quantities by purchasers who are powerful, well informed and able to exert pressure.

Both governmental regulation under the police power and action proceeding from within private industry itself have frequently suffered from glaring defects. The governmental agencies charged with regulation often have an enormous task, presented by the extent and complexity of

the processes to be regulated. Sometimes they are not granted sufficient powers under the law and are further severely limited by judicial review. Insufficient appropriations render them unable to compete with the regulated industries for high salaried experts and to carry on extensive supervision. Corruption or more subtle influences may damage their integrity. When such regulation involves, as it often does, a contest between the policing body and profit seeking concerns engaged in trying to circumvent it, the government is at a disadvantage. Its control over industry is negative and it can act only after the event in most cases. Its task is usually so technical that it is not much strengthened by popular vigilance and support. The efforts of industry to police itself without governmental aid have to contend not only with the desire for greater profit which can sometimes be derived from undesirable practises, but with the difficulty of obtaining unanimous or nearly unanimous consent of all the competitive groups concerned. This dilutes the quality and number of the standards arrived at and makes difficult disciplinary dealing with those who disregard them.

A potent force in this situation is the pressure of cooperative consumers' societies. They offer protection to their patrons in so far as they utilize scientific methods of buying and distribute consumers' dividends. They tend to cut through advertising and salesmanship and substitute the organized impulse of the consumers for that of the producers in determining the nature of goods. This tendency is particularly marked wherever the cooperative movement is widespread and reaches back into the wholesaling and producing processes.

In a country like the United States, where consumers' cooperation is relatively insignificant, reliance must be placed upon the pressure of large consumers who employ a scientific buying technique. The federal government with its Bureau of Standards and other similar agencies is a leader in this respect. The Bureau of Standards analyzes all the products offered to supply the needs of the government, works out specifications for the product desired and tests the delivered product to check its compliance with the specifications. The bureau's standards and specifications are available to anyone, but the results of its tests of competitive commercial products are open only to state and municipal governments. In order to make the same techniques available to retail consumers, a non-

profit consumers' research organization has recently been formed to advise them concerning the relative merits of retail goods. Through the spread of such institutions or of consumers' cooperation or possibly of the use of scientific buying technique by large commercial retailers the ultimate consumer may gain increased protection.

CONSUMERS' COOPERATION. Consumers' cooperatives are to be distinguished from consumers' leagues or other public or semi-public organizations which seek to protect consumers' rights in the course of their dealings with producers or purveyors of consumption goods. Consumers' cooperatives are actual economic enterprises in the form of stores or shops, set up by associations of consumers to distribute fundamental consumption goods, usually staple food items, but also at times clothing, furniture and the like. In the process of expansion a group of stores may set up a wholesale distributive and may even establish its own factories and farms for the production of these goods. Or consumers' cooperatives may furnish other consumption needs, such as housing, insurance against risk, provision of gas, light, transportation. In order to set up these enterprises it is necessary to acquire capital and to found a joint stock society.

These economic enterprises differ, however, from ordinary joint stock companies not only in their aims but in their actual economic and legal characteristics. In the first place, they are not restricted as to the number of members and the number of shares but are open to anyone who wishes to join, and the last comers, moreover,

are on an equal footing with the first. From this initial rule necessarily follows the corollary that the value of the shares at no time can be higher than their price at issuance and that speculation on rising values is therefore impossible. This constitution, practically impossible in an association for production purposes because of limitations both of capital and of demand, is advantageous in an association of consumers in which each new arrival brings with him his consumption capacity.

In the second place, capital as such does not play the same role or have the same rights in government or profits as in ordinary joint stock enterprises. In the consumers' cooperatives every member has an equal vote in the assemblies regardless of the number of shares he may possess. The profits of the enterprise are divided pro rata for purchases and not for shares, so that it might be said that profits are returned to those who originally paid them. In fact, in describing the return French cooperative enterprises prefer the term *ristourne*, or *trop-perçu*, to the English cooperative term dividend with its profit making connotations. Thus it might well be asserted that these returns to purchasers are not a form of profit but rather the negation of profit. Cooperatives have protested against a tax on alleged profits which they claim are non-existent because the surplus redistributed to members was based on overpayment arising from the practise of marking goods at current competitive prices.

As a result of these rules capital, whether obtained in the form of loans or of shares, is restricted to a mere return based on the cost of obtaining it or as limited remuneration for its share in the services rendered and is no longer the dominant factor in the government of the enterprise or in the distribution of profits. Within this voluntary association therefore capital and profit in their ordinary forms are virtually abolished by pacific legitimate means, without any imposition of exterior restraint or any change in the basis of the social and economic order as to property, inheritance, interest, salary or even competition. There is nothing in the nature of the association to prevent its spread by the formation of similar voluntary associations and by federation throughout the nation or even on an international scale.

These economic and legal limitations on the role of capital and profits are supplemented by certain further ethical limitations self-imposed by the majority of consumers' societies. These

include the provision that not all profits are to be returned to the individual members but that a portion is to be devoted to enterprises for collective welfare, such as the propagation of cooperative ideals and the provision of educational and recreational facilities for workers.

The special characteristics of consumers' cooperative enterprises require special legislation, for they do not easily conform to common law concepts. Thus there are special laws on consumers' cooperatives in most countries today, including countries such as Mexico and Argentina where the movement is still in its infancy.

Consumers' cooperatives, which now include over 40,000,000 members in about 60,000 societies in thirty or more countries, began in 1844 with the association of twenty-eight English weavers in Rochdale near Manchester. As early as 1827, however, consumers' societies had existed and had even developed sufficient strength to establish a wholesale; one or two societies still in existence antedate the experiment of the "Equitable Pioneers of Rochdale." Nor did the theory of cooperation arise with the Rochdale weavers. They were in fact somewhat under the influence of Robert Owen, whose use of the term cooperation made it synonymous with communism but who is often credited with the paternity of the movement because he coined the term and said: "You must become your own merchants and your own manufacturers . . . to be able to supply yourselves with goods of the best quality and at the lowest price." Both in Owen's plans and experiments for communistic settlements and in those of the French socialist Fourier in his *Traité de l'association domestique agricole* (2 vols., Paris 1822) social transformation into these forms of society was to come about through outside intervention of philanthropists. But the Rochdale Pioneers began to express this social transformation through the voluntary and independent association of groups from the very midst of the masses and thereby gave it its voluntaristic and democratic form. It was one of their members, Charles Howarth, who devised the method of disposing of surpluses which is described above, and which proved to be the indispensable practical as well as ideological tool for the accumulation of membership, capital and patronage. Prior to that time profits had been distributed to shareholders (a practise which encouraged the limitation of membership), equally divided among all members without regard to their patronage of the enterprise or else buried in

an inalienable reserve fund. The essential characteristics of all consumers' cooperatives, including the sale of goods at current prices and for cash and the device of voting by membership instead of by shares, were also inaugurated by the Rochdale weavers. Although in several countries individual consumers' enterprises mainly under the influence of Fourierist disciples had been experimented with before the Rochdale enterprise, the history of consumers' cooperation throughout Europe is mainly one of the founding of societies patterned on the Rochdale practises. It is true that the Rochdale Pioneers in their original statement of aims included the emancipation of the workers from their employers through self-employment and even the founding of cooperative communities. But they themselves never carried these principles into practise, and in England it remained for a group under the moral leadership of the early Christian Socialists to attempt the fulfilment of this aim.

The development of consumers' cooperation has proceeded instead along the assumption, not clearly articulated at the outset, that production was not an end in itself but must be a response to consumption needs of society. This is illustrated in the development of consumers' societies within a country or community. Small consumers' societies commonly begin with, and often limit themselves to, the provision of simple uniform daily needs which requires neither large capital nor special technical equipment. Groceries and bakeries are usually the first types of store to be established. Somewhat later, as in the case of large English cooperatives, they extend their scope to include haberdashery, clothing, furniture and the like. Usually housing or insurance societies take the form of separate organizations. When the societies have reached the second state of development, that of a regional union among themselves, they set up a wholesale society. In the course of time these wholesales have themselves entered upon the field of production, both because the consumers' cooperatives wish to procure the articles as close to the source of production as possible in order to reduce costs and because they have found themselves at times in conflict with capitalistic production—as when a large soap concern in England objected to the dividend as a price cutting scheme and when, on the other hand, the cooperative movement joined with other socially minded organizations in a protest against the treatment of labor on native planta-

tions. Thus the wholesale societies of Manchester, Glasgow, Hamburg and Stockholm and the Centrosoyus of Moscow have established large industrial plants which at times have been able to defeat capitalist trusts.

With the entry of the consumers' cooperative into the fields of production and distribution there arose the question of its relations to the labor employed by society. In England and Germany, for instance, while a large proportion of the membership of the consumers' societies is drawn from the laboring classes, the workers employed by the cooperatives regard them as employers. These workers have of course the opportunity, of which they usually avail themselves, of joining constituent societies and thereby benefitting as consumers from the operations of the cooperatives. In fact, such students of the cooperative movement as Beatrice Webb see in the consumers' cooperative movement a new social organization which would supplement the trade union movement by organizing the workers as consumers. This has generally been the attitude of the trade union leaders and the basis of their support in most countries of the cooperative movement. On the other hand, the cooperative societies have in most cases been willing to recognize and deal with their workers as an organized group and in some cases have been of great aid to the trade union movement. In Germany standard agreements with the unions have been worked out with reciprocal obligations on both sides. This has checked the tendency of the specific trade unions involved to ask for standards above those which they set in their agreements with ordinary commercial and industrial enterprises. A highly praised expedient for dealing with this problem is that employed by the Scottish wholesale of making workers eligible to membership not only in the constituent societies but in the national federation itself, in which they are granted voting power in proportion to the total membership. A suggestion has been made of permitting representation of the employees either upon the board of management or upon the advisory board of the wholesale society.

Moreover, the English societies in particular found themselves in competition not only with capitalistic trusts but with workers' producing cooperatives, which in many cases they finally absorbed. When the field of production is agriculture, new conflicts arise with agricultural cooperators, who are a far more powerful group than the workers' producing cooperatives ever

were. In Scandinavian countries and elsewhere, where on the whole agriculture and industry are equally important, central clearing houses functioning between the various types of organizations have been set up with varying degrees of success. The wholesale cooperative of so industrialized a country as England has entered into cooperative agreements with the central clearing houses of other countries, but it has come into conflict with the agricultural cooperative movement within the empire, especially in Ireland. The problem is by no means resolved and is a matter of great concern for the cooperative movement.

Conflict with other types of cooperatives either in practise or in ideology arises also in the second state of development of the cooperatives, when individual scattered local societies form into a national organization. The tendency at first is to unite all types of cooperatives in one federation, but inevitably conflict has arisen which has led to the establishment of separate types of nationals. Similar conflict arose in the third stage of development, when national federations formed in 1895 the International Cooperative Alliance. Although it is nominally an alliance of all types of cooperation, conflicts have resulted in the withdrawal of many agricultural and credit societies and in the refusal to admit that type of profit sharing enterprise known as copartnerships, until now more than three fifths of its membership are affiliated with consumers' cooperatives.

These three stages of development—the formation of local consumers' societies (which in most countries of Europe began about 1865), then the formation of national associations about a decade later and finally the affiliation with an international organization—have not been undergone by the cooperative movement in all countries, for development has not been equal in all countries. In France and to some extent in Switzerland large numbers of individual societies are not affiliated with the national federation, and the consumers' society membership of the International Cooperative Alliance includes only 33,000,000 out of 40,000,000 in all countries. Cooperation is far more active in the north than in the south. Thus in the north are the three great countries of cooperation—Russia, Great Britain, Germany—and the two smaller countries which are from the point of view of intensity and quality of the movement of great significance—Denmark and Finland. In Belgium, Switzerland, Czecho-

slovakia, Austria, Hungary and Poland the movement also flourishes. But in Italy, Spain, Rumania, Portugal and even in the southern half of France itself consumers' cooperation is poorly developed. In some of these countries, however, agricultural and credit cooperative movements are more flourishing.

More specifically, the development of co-operative movements and of their particular types is bound up with the stage of development of general economic and social forces. In countries but poorly developed except in agriculture and there suffering from certain defects of primitive organization it is only natural to find credit and agricultural and not consumers' societies. Moreover, consumer's cooperatives flourish best in societies of large membership—in London they reach numbers of 100,000 or even 300,000—whereas other cooperative forms can be founded among small groups. Since the interest of the consumer is far less apparent than that of the producer and since he is usually passive in his role, the consumer's cooperative is more difficult to develop.

The success of the consumers' cooperatives within a country can be judged by membership figures, by the proportion of the total population which this membership includes, by the total extent of its sales, by the average sales per member and by the proportion of the member's income which is spent in his cooperative store.

Russia with a membership of over 15,000,000 in consumers' cooperatives accounts for almost half of the total consumers' membership of the International Cooperative Alliance; Great Britain follows with a membership of 5,600,000, almost a sixth of the total membership; Germany and France follow with about 4,000,000 and 2,500,000 respectively. But the movement in some of the smaller countries, such as Switzerland and Hungary, represents as high a proportion of the total population as in Great Britain and a great deal higher than in France. There is a similar variation in the proportionate purchases per member in Great Britain, Hungary, Russia and Switzerland, for instance, the membership of consumers' cooperatives represents one tenth of the total population, and since this usually includes only one member of a household of four or five persons it is apt actually to represent almost half of the population. In the community of Basel practically the entire population belongs to cooperatives.

Another test of the strength of the movement is in the degree to which it has pervaded the lives

of its membership. This is shown not only in the extent of membership or of sales but in the development of education along cooperative lines, in the development of the cooperative press and of educational courses within the movement itself and in the introduction of courses on co-operation in the schools and universities of the country; in the establishment of "people's houses" as in Belgium, in the extent to which the women and children have been drawn into the movement and in the democratic participation of its entire membership. It is true of course that, as the movement gains in numbers and geographic extent, the last named activity becomes a problem. This is closely linked, however, with the development of an able leadership both for the technical administration of the business of the cooperatives and for its educational work.

Broadly speaking, the consumers' cooperative movement has certain fundamental rules, evolved by the weavers of Rochdale, which are everywhere observed. They are: absolute equality in elections—one man, one vote; the return of profits to the buyer pro rata for purchases after the deduction of a specified levy for collective works of education, recreation and solidarity; and sale at current price for cash.

In addition to these basic principles there have appeared attempts to give the movement a broad theoretical and ideological basis. Theorists have not been in complete agreement—a natural situation when the origins of the separate movements and the variations in nationality, social background, political affiliation and even economic grouping of the membership are considered. Internationally the movement is politically neutral. In certain countries and communities, however, it is socialistic or socialistically inclined. Thus the Belgian cooperative movement was begun by socialists and although not restricted to them in membership still maintains its socialist character; in Russia the movement is of course communistic. In certain countries separate socialist federations have been formed, and almost everywhere there exist socialist minorities.

Diversity of opinion within the movement itself in the determination as to what attitude it should take toward other forms of cooperative endeavor, toward socialism, trade unionism, profit, the capitalistic order and the state has accelerated the formulation of a theory. In England the work of Beatrice Potter (Mrs. Sidney Webb) in her *The Cooperative Movement*

(London 1891) was epoch making. In Germany, under fire from the socialists on the one hand and the marketing and credit cooperatives on the other, the leaders of the consumers' societies were slow in evolving an ideology. Earlier than any of these attempts, however, was that begun in 1886 by the group which came to be known as L'École de Nîmes and which has most emphatically stated the doctrine of cooperation.

This group sees economic government passing from the hands of the producers and capitalists to the hands of the consumers, whose ranks include all classes. This placing of the consumer in the first rank was a new idea, for previously he had been accorded the most negligible of roles in theory and practise. The English co-operatives, for instance, even today carry not the name of consumers' societies but rather that of distributive societies. This point of view means to consumers' cooperatives the loss of a specific working class character. It does not, however, imply any desire to ignore the essential working class origins of the movement in most countries or even its general socialistic and radical leanings, especially as exemplified by the Belgian socialist cooperatives and political and economic alliances between the English cooperatives, the trade unions and the Labour party. It refuses to accept the Marxist statement that labor is the sole creator of wealth and declares that it is consumption, or need, which creates value. With equal force cooperation refuses to capital the right to control production and to draw profit, and it has thus encountered the opposition of the middlemen and manufacturing capitalists. Where the state is markedly capitalistic it too has reflected the opposition to consumers' cooperation.

The socialists on their side have had a rather varied and complicated attitude toward cooperation. At the beginning of the cooperative movement in the middle of the last century they were very sympathetic to the idea, especially to producers' cooperation, since it was a specific proposal of such socialists as Owen, Fourier, Louis Blanc, Lassalle, Mazzini. The failure of this type of cooperation and the formulation of Marxism caused a rejection of all cooperation on the grounds that it was a purely reformist and bourgeois program. Nevertheless, in actual practise such examples as the reciprocal role of cooperation and socialism in Belgium, the actual assistance rendered by consumers' co-operatives in many countries during periods of industrial struggle and a recognition of their

general importance have led to a revision of the socialists' attitude. They recognize cooperation, however, only as an annex of socialism for the purpose of furnishing them with resources at times of strikes and political elections. Thus the cooperative, the trade union and the party are all three yoked to the socialist chariot and must be proletarian in character. If the cooperative remains neutral it is more of a hindrance than a help, for then it will be more servicable to the petty bourgeoisie than to the workers or might even transform the proletarians into small capitalists greedy for bonuses and completely uninterested in all revolutionary action. Nor do the socialists accept the thesis of L'École de Nîmes that the control of the economic world should belong to the consumers; they naturally claim it for labor.

The claim of the French school has also been criticized by economists, especially those of the "liberal" school. Part of their criticism of cooperation centers about the relation of the movement to the state. The "liberal" economists of course profess a strong antipathy to the intervention of the state in the economic order, and thus they object to the existence in some countries of favorable legislation, subventions, exemptions from taxes and other privileges which are accorded to cooperative societies. It is necessary to point out that on the whole these privileges have been more frequently accorded to agricultural societies, credit or marketing or producing societies, than to consumers' organizations. In some countries the consumers' movement has been initiated with state aid, although in others municipalities and other public bodies have expressed hostility by forbidding their employees to be members of consumers' cooperatives. The cooperative movement has carried on an effort, sometimes against great odds, for legislation recognizing its peculiar status; and its sponsors cannot be classed with those advocates of voluntary mutual aid who will not recognize any right of legislation on the part of the state. In certain countries, as in Russia, and in such communities as the city of Basel where practically the entire population belongs to the cooperatives, the state can with justice be considered merely as the political expression of the economic unity. On the part of the state itself there has been a tendency to enter the field of consumers' cooperation, which is best illustrated perhaps by the cooperative public boards developed in Belgium and to some extent in Italy and Austria. These consist of cooperative

organizations set up by national, provincial or municipal government bodies for the purpose of providing gas, light, water, transportation, credit and housing for these communities. The dividends of these operations are divided according to consumption use. They are an example not of "stateizing" the cooperatives but of placing certain functions of public administration on a cooperative basis. In this identification, however, there is no retreat from the cooperative ideal of opposition to constraint. It was the element of constraint which led the International Cooperative Alliance between 1917 and 1921 to refuse to admit the Russian cooperatives because of their obligatory character, and it is for the same reason that the alliance still refuses to accept the Fascist cooperatives. The relation of the cooperative movement to the state during the period of the World War was of a similar character. In every country the cooperative movement rendered so great a service in the supply of food and other necessities to the population as to merit governmental approval. The International Cooperative Alliance, however, at all times held fast to its ideal of peace between the nations as embodied in its endorsement of such pacifist measures as disarmament, arbitration, commercial union and the removal of tariff barriers; and during the war it was one of the few international bodies which maintained relations between warring countries.

Within the field of economic endeavor itself the criticism of the "liberal" economists has centered on the claim that consumers' cooperation introduces a new element into economic theory and practise. A few of their number have chosen to see in the attempt of the cooperatives to formulate standards as to a "just price" and a "just measure" interference with the salutary effects of competition as it operates in supply and demand under a regime of self-interest. Others, however, look upon the fact that consumers' cooperatives base their prices on current "fair" prices, as established by ordinary competition, as proof that they too are governed by supply and demand and that the dividends, so called, are in reality a form of profit.

On the whole, however, the economists have not condemned cooperation, since in the last analysis it is a form of free association. They are willing to admit that it is of considerable service: to the consumer in serving as a check on the extortion of merchants and in reestablishing the desired effect of competition, which so far as the consumer is concerned is threatened today by

the coalition of producers; and to the worker in permitting him to utilize most advantageously the purchasing power of his wages and even by the redistribution of bonuses to realize savings which may permit him to acquire property.

This limited concept of cooperation, particularly as formulated in the second half of the last century by Paul Leroy-Beaulieu, Léon Say and M. Pantaleoni and reaffirmed more recently by Robert Liefmann in his article "Monopolies and the Interests of the Consumers" (in *Review of International Cooperation*, vol. xxii, 1929, p. 201-10), has been accepted by some groups of co-operators and is held in high repute by the leaders of Fascist cooperation. The French school realizes that this program in itself allows a vast field of action, but it reaffirms its belief in the capacity of the consumers' cooperative to go beyond these limits. In the economists' criticism is implied a denial of the assumption that an economic order based on a recognition of the needs of the consumer can replace one in which production operates through the motive of individual self-interest expressed in the form of profits. L'École de Nîmes does not postulate its assumption on the abolition of personal interest or the hedonistic principle, but it insists that mutual help is more efficient than self-help and points to the existence of the widespread consumers' movement as proof of the fact that enterprises can live and prosper without the profit motive as it exists in commercial enterprises. This is all the more remarkable because even by definition consumers' cooperation, in contrast to producers' organizations, is an association of non-professionals. Nevertheless, they have developed technical and administrative ability of a high order, and the questions of sharing profits or even of paying high salaries to management, although they have occasionally come up for discussion, have never had to receive serious consideration. As Alfred Marshall pointed out in a presidential address to the Cooperative Congress in 1889, this is probably because cooperation is "at once a strong and calm and wise business, and a strong and fervent and proselytizing faith." It is, in other words, an economic enterprise not wholly in the service of Mammon.

CONSUMERS' LEAGUES are voluntary organizations of retail purchasers seeking by their own patronage and by research, education and publicity to improve working conditions. The founder of the movement in the United States, Mrs. Charles Russell Lowell, explained its purpose in the statement that "the responsibility for some of the worst evils from which wage-earners suffer rests with the consumers, who persist in buying in the cheapest market, regardless of how cheapness is brought about. . . . It is, therefore, the duty of consumers to find out under what conditions the articles which they purchase are produced, and to insist that these conditions shall be at least decent and consistent with a respectable existence on the part of the workers" (Nathan, p. 25).

The first consumers' league was organized in England in 1890, and the movement in the United States was begun at about the same date. The first local league was formed in New York City in 1891 as a result of a report of conditions in retail shops made in 1890 by Alice Woodbridge, secretary of the Working Women's Society, the forerunner of the Women's Trade Union League. She brought this report to the attention of Mrs. Lowell, founder of the Charity Organization Society, who interested Dr. Mary Putnam Jacobi, first woman member of the New York Academy of Medicine. A small group, including Mrs. Maud Nathan, who became president of the organization, proceeded to organize the league. Its first activity was to prepare a white list of shops paying minimum fair wages and having reasonable hours and decent sanitary conditions.

The movement was extended about 1896 to Brooklyn, Philadelphia and Boston. State leagues were organized in Illinois, New York, Pennsylvania and Massachusetts. At a conven-

tion held in New York on May 17 and 18, 1898, these bodies federated to form the National Consumers' League. Mr. John Graham Brooks was elected president and Mrs. Florence Kelley, who had been at Hull House, Chicago, was made executive secretary, a position which she has since held continuously. Mr. Newton D. Baker succeeded Mr. Brooks as president in 1915 and was followed in 1923 by Dr. John R. Commons. Local and state leagues were formed throughout the country, and five years after the organization of the national league there were sixty-four branches in twenty states.

Consumers' leagues following the American example were organized in France, Holland, Belgium, Germany and Switzerland, and two international conferences were held: one in Geneva in 1908 and another in Antwerp in 1913. As a result of the Geneva conference the delegates pledged themselves to work for minimum wage boards in their respective countries.

The first investigation undertaken by the National Consumers' League in the United States concerned the conditions of manufacture and sale of women's and children's stitched cotton underwear. It began in New York and continued for about fifteen years in other states. Investigations were thereafter extended to other branches of the needle trades, to insanitary tenement home work and sweatshops, to laundries, restaurants, textile mills, canning establishments and candy factories. In one case a local consumers' league brought about sanitary handling and inspection of milk. Reports of the National Consumers' League were usually pioneer revelations of undesirable working conditions and were accepted as authoritative by legislators and educational institutions.

The instruments employed by the movement have been varied. One of the earliest, which has become relatively less important in recent years, is the white list of concerns endorsed by the league, intended to affect conditions by attracting the attention of individual consumers. At first such lists were printed as paid advertisements in newspapers, but large advertisers who were omitted boycotted the papers which accepted the league's advertisements thus causing the suppression of this means of publicity. White lists are, however, printed and distributed in leaflet form. One of the most recent, which deals with candy manufacturers, specifies in detail the qualifications for inclusion in this list and is based upon a thorough study of conditions in candy factories

Another method used for several years by the league was the white label, which manufacturers or retailers were by contract permitted to attach to goods made and handled under conditions approved by the league. It was impossible to extend the application of this method to a large variety of products, due to the difficulty of inspection by a volunteer private agency. The task of educating consumers to understand and respect the white label was a gigantic one, which, although prosecuted with energy by means of exhibits, speeches, literature and general publicity, was probably more effective as a means of moral pressure on business men than as a method of influencing the purchases of any large percentage of consumers. Use of the white label on garments—on which it had chiefly been employed—was abandoned when the International Ladies' Garment Workers' Union adopted the Prosanis label for goods made under proper sanitary conditions in union shops.

Reports and agitation of the league were probably more influential in the field of legislation than in any other way and affected particularly the passage, enforcement and defense of laws governing the employment of women and children. Such laws have to do with safety, sanitation, night work, maximum hours, limitation of child labor and in some cases minimum wages. Investigations, reports and publicity are made the basis of pressure on legislatures and Congress for the improvement of enforcement, and in these campaigns the league has frequently had the cooperation of the American Association for Labor Legislation, the National Child Labor Association and the League of Women Voters. It has also stimulated the creation of official bodies either for special investigation or for continuous administration, as in the case of the federal and state bureaus of women in industry and the federal Children's Bureau.

Although not always in agreement with trade unions the league has often cooperated with them in achieving ends jointly desired. It has frequently obtained the active cooperation of employers in raising standards in instances where the ultimate interest of the employer coincides with that of the worker. An outstanding example was the campaign for early Christmas shopping, in which the league was a pioneer, and which was taken up not only by important merchants but also by the United States Post Office Department.

The national league's support of welfare laws when they were attacked in the courts as un-

constitutional has been of special value. Briefs prepared by Louis D. Brandeis, its counsel until he became a justice of the United States Supreme Court, Josephine Goldmark and Felix Frankfurter have established a new method of defending social legislation in the courts. The argument against such laws usually rests on some abstract principle, such as violation of freedom of contract. The cases against them are usually built up on the grounds of legal precedent drawn from periods in which the same social and economic forces were not operative or from situations which were in fact widely dissimilar. The briefs in support of the laws have utilized exhaustive studies of the conditions which the legislation in question has been designed to remedy and of its efficacy in remedying them. The relation of the general public welfare to the health, morals, safety and social welfare of workers has demonstrated the justification for the limitations imposed on the right of contract. These laws have dealt with hours of labor, night work for women and minimum wage, and in a long series of cases, beginning with the Oregon ten-hour case [*Muller v. Oregon*, 208 U. S. 412 (1908)], they have usually been sustained. The principal defeat suffered by the league was in the District of Columbia minimum wage cases, the law being declared unconstitutional by the Court of Appeals of the District in 1920. The decision was affirmed by the United States Supreme Court in April, 1923, by a vote of five to three (*Adkins v. Children's Hospital*, 261 U. S. 525), Mr. Justice Brandeis not voting. This series of briefs has been printed by the league and has been distributed to law schools, libraries, colleges, universities and students of economics and has had a profound influence on public opinion in addition to its direct effect on court decisions.

In the course of time it has become clear that the consumers' league movement is not so much one which can depend on the power of consumers acting in their immediate interest—although that interest is involved in maintaining sanitary conditions—as one which rests on the public spirit of those actuated by reformist or social motives. Even though the zeal of its active spirits never flags, it must depend for its financial support on membership fees and voluntary contributions and for its social credit on the state of public opinion. This constitutes both its strength and its weakness. In periods when the spirit of social reform is active, when the social conscience is more easily stirred by

exposition of abuses which ought to be remedied, its membership is most numerous and its effectiveness is greatest. When, however, confidence in this type of action wanes, when people become cynical concerning reform or careless of social welfare, it declines. Thus in the period following the World War the consumers' league movement was severely handicapped not only in the United States but abroad. It is weak also in nations where more radical political or economic movements become powerful and force the pace in regulation of economic life. Such an organization is well nigh inconceivable in Russia, for instance, and even in England and Germany the corresponding groups have been overshadowed by the socialist and trade union movements. It is noteworthy, however, that in the United States the support for social legislation has in the past three decades come chiefly not from trade unions, which in many cases have opposed such legislation, but from the consumers' league and similar bodies.

CONSUMPTION.

IN ECONOMIC THEORY. Consumption is commonly stated to be the end to which the other stages in the economic process, production, exchange and distribution, are means. If consumption is viewed not only economically but also ethically and psychologically as the end of activity, it appears that consumption is practically synonymous with the whole of man's activities, that it is his way of life. Such a con-

cept inevitably leads on to the multiple problems of relative values in life, wherein consensus of opinion is scarcely to be expected.

Although interest in the theory of consumption is of fairly recent origin, the history of sumptuary laws is evidence that standards of consumption have had a perennial public interest. Such prescriptive rules, whose basis has been at times one of class distinction, at others one of enforced righteous conduct or as under mercantilistic practise one of consumption directed to home industries and enforced frugality of the working classes as a means to national wealth, have in general tended to relax or disappear with the rise of the individualistic regime.

The relative neglect of consumption in the social theory of the eighteenth and early nineteenth centuries is to be explained only by referring to the points upon which such theory centered: first, the means of promoting the well-being of the generality of mankind and, second, a scientific statement of the laws governing the actions of men in society. Although ramifying into the fields of ethics and political science the subject of consumption under both these headings was afforded a somewhat tentative and uncertain admittance to political economy. Admitting as axiomatic the dictum of Adam Smith that consumption is the sole end of production, most economists were nevertheless prone to regard habits of consumption as private matters, except in so far as they affected the production of wealth, and to accept market demands as self-sufficient phenomena from which to proceed to an examination of the production, distribution and terms of exchange of economic goods. Despite the general emphasis upon the merit of accumulation of capital by saving, an outstanding exception in this respect was Lord Lauderdale, who in 1804 in writing on public wealth and private riches condemned individual riches as representing scarcity value, with the conclusion that great expenditures increase public wealth while savings diminish it. The early concentration upon production was in some degree a heritage from mercantilism; and mere abundance, induced by pecuniary incentives, was to many laissez faire economists the rude test of economic welfare. Moreover, assuming freedom of individual choice and action on the basis of self-interest, it was possible to construct an objective system of laws of production, distribution and value of a sort not attainable for so personal a matter as consumption. Working thus objectively upon a given range of problems

economic theorists hardly saw that there was a problem of consumption except in so far as it directly affected these "basic" problems.

The early nineteenth century economists were divided upon whether to admit consumption as one of the principal subdivisions of political economy. J. B. Say in his *Traité d'économie politique* (1803) included consumption as a subdivision, but the English economists in general did not follow his example. They did, however, discuss elsewhere the same topics that were classified under consumption by others. These latter were equally divided as to the appropriate subject matter, and under the general heading of consumption one may find treated such miscellaneous topics as the following: the distinction between productive and unproductive consumption and the general relation of habits of consumption to progress in productive efficiency; the relation of thrift to capital accumulation; class standards of consumption and the relation between consumption and the distribution of income; standards of consumption as evidence of social progress; taxation, both as affecting private power to consume and as furnishing the basis for "public consumption"; the relation of standards of consumption to the growth of population; the economic effects of the consumption of luxuries; and the relation of consumers' demands to the stability of economic life.

In English political economy most of these topics appear under the various headings of production, distribution and exchange along with other topics such as the effect of costs of production upon consumption through the process of substitution of demand and the extent to which it is possible to separate the interests of consumers from those of producers. Such topics were not a fruitful field for scientific generalization; but for this were substituted edifying homilies upon "judicious" consumption and the virtues of thrift. The emphasis given to production later gave rise to the criticism that in spite of Adam Smith's axiom economists tended to regard production as the end of the economic process rather than as a mere means to human satisfaction. The theory of welfare based upon freedom of economic enterprise naturally gave rise to criticism from nationalistic, humanitarian and aesthetic angles: List, Ruskin and William Morris, for example, declared that welfare implied a qualitative excellence of products and taste which was not induced by merely pecuniary incentives. Most

socialistic theory, however, centered upon the distribution of wealth and was as much concerned with production and as little concerned with consumption—except in its class aspects—as was liberal theory.

The recent prominence of consumption in economic analysis may be attributed to several causes: the elaboration of technical value theory, developments in the science of psychology, a scientific interest in the dynamic or evolutionary aspects of economic life and a reconsideration of the problems of economic welfare.

It was the central characteristic of the so-called psychological school of economists that they gave causal priority in the fixing of market values to the process of subjective valuation in the minds of the purchasers (consumers) of goods and made the processes of production and exchange subordinate to consumers' choices. They developed the elaborate mechanism of diminishing and marginal utility in explaining consumers' choices which still thoroughly colors most contemporary value theory. Essentially this was a theory of consumption of a presumably scientific character and when combined with the earlier analysis of production eventually resulted in the equilibrium theory of price.

The validity of the utility theory has been widely questioned on the ground that it relies upon a hedonistic psychology. Much recent psychology has tended to deny the general dependence of individual choices upon a rational consideration of alternatives and to emphasize such factors as the instinctive basis of conduct, the dependence of individual conduct on social habits or modes and the emulative character of conduct. There exists no theory of human behavior which commands a professional consensus of opinion, but the various theories are sufficiently antipathetic to the utilitarian calculus to have reduced the utility theory of consumption to a minor and disputed status, capable perhaps of throwing light on the market demand for goods but incapable of explaining contemporary standards of consumption. There exists today a strong tendency to develop the theory of economic consumption by the behavioristic method of inference from extensive observation.

The declining prestige of the utility theory is also a reflection of the extent to which the interest of economists has turned to the dynamic or genetic aspects of economic life. The utility theory assumes the existence of desires, while the genetic problem is to explain their existence. The divergence in approach has been up to the

present time sufficiently sharp to prevent the construction of any composite or unified theory of consumption adequately covering both social influences and individual choices.

Giving rise to the idea that economic welfare was a matter of "maximum satisfaction" the utility theory became entangled with reform movements, furnishing arguments for both the competitive and socialistic regimes. The idea of maximum satisfaction is dependent upon a quantitative comparison in purely individualistic terms of the satisfactions of consumption with the irksome labors of production. Recent discussions of welfare have tended to emphasize congenial and useful employment as an essential element in individual welfare and to indicate how social interests are damaged by consumption which may be satisfying to the individual. This tendency results in a partial obliteration of the "ends and means" relation of consumption and production and reduces consumption to an auxiliary position in the theory of welfare. Moreover, in America at least, the extraordinary increase in the productivity of industry and in the supply of investable funds has resulted in declining interest in thrift. Emphasis has recently been placed upon the organization and financing of consumption for maintaining the uninterrupted productive efficiency of the industrial system.

In the attempt to treat consumption realistically numerous aspects of modern economic life have been noted: for example, the extent to which consumption is essentially non-volitional, as in the consumption of housing in an industrial city; the extent to which consumption standards are imposed by the selling methods of producers with a pecuniary interest; the unorganized and haphazard character of consumer buying; the extent to which consumption is dictated respectively by the minimum needs of life, by the nature of one's occupation and by social pressure. Current discussions of consumption may be said to be in this essentially descriptive stage. The discussion relates itself, however, to current psychological and sociological theories. Its primary interest perhaps lies in the relation of consumption to the possibilities of human betterment, but it has an independent scientific interest. Professional economic opinion is at present divided as to whether economic science can proceed without a theory of consumption or whether such a theory is an essential prolegomenon to the science without being a part of it or whether it is an essential constituent part of a

well developed descriptive analysis of economic action and motivation.

PAUL T. HOMAN

PROBLEMS OF MEASUREMENT. The interest of the empirical economist as distinct from that of the economic and social theorist in the subject of consumption centers about such problems as the quantities of various commodities consumed in relation to the general level of prices and incomes, and the fluctuations in their quantity and quality among different peoples and at different periods. A fairly definitive answer to such questions is possible on the basis of available quantitative data.

Empirical, historico-statistical investigation has at its disposal two kinds of sources: information regarding the consumption of commodities of single families and information regarding the consumption of whole commonwealths. The sources of the first kind for past times are individual descriptions, more or less typical, and not statistical mass observations. Here belong the descriptions of extreme wealth and luxury and extreme poverty and destitution, which establish standards for comparison with the present and also make possible conclusions regarding the consumption of the middle classes during the periods in question. The precise moments at which the pocket handkerchief, the looking glass, the bathtub ceased to be the peculiar perquisites of kings and later of nobility and chief burghers can be fairly accurately determined. Certain conclusions may also be drawn on the one hand from information, in so far as it is available, regarding the income in money or in kind of people of particular social orders and on the other from information regarding the prices of grain, meat, wine and cloth. Also the houses and the samples of domestic inventory extant (mostly belonging to the well to do classes) make possible a picture of the character of the consumption of former centuries. The same may be said of the descriptions of primitive households as reported by itinerant investigators.

Present day information regarding consumption of single families is based upon statistical investigations of large numbers of family budgets. If the number of reports is large and the sample representative, casual deviations in each direction will cancel each other and the picture obtained may be regarded as typical. An important source of error, to be sure, arises from the fact that the material is necessarily supplied by people who are more than usually exact,

diligent and frugal, for others can scarcely be induced to fill out useful questionnaires. In order to preserve their mass character most investigations are confined to the lowest classes of income, which include the overwhelmingly greater part of the industrial population of the cities. Some investigations have also been made of budgets of farm families. The determination of farm consumption, however, offers peculiar difficulties, since it includes to a considerable extent home grown rather than purchased commodities, whose money value can only be estimated; furthermore, farmers' family budgets, as also the family budgets of artisans and small shopkeepers, are often hard to separate from the outlay for means of production. Detailed reports of the budgets of the middle and upper classes present still greater difficulties; they cannot be dealt with by the method of mass observations because of the important differences among households.

It is possible to determine approximately the consumption of whole commonwealths in the case of those goods for which there exist statistics of production and of foreign trade, since, setting aside possible changes in stocks, the consumption may be set forth roughly as production plus import minus export. In the case of goods not produced in the country, such as, in Europe, all luxuries of exotic origin like tea, coffee and cocoa, the consumption is the same as the importation after subtracting the re-export and again ignoring any movements of stock. To the extent that taxes are collected upon commodities as they enter into consumption, such as tobacco goods, alcoholic liquors and sugar, tax statistics furnish immediate data. Finally the data of family budget statistics selected at random as samples may be used as a basis for the appraisal of national consumption, if the ratio which the numbers at each income level bear to the whole population is known.

Using the sources as above outlined it becomes possible to compare individual with national consumption, portraying against the general background the consumption of a particular group. If per capita figures of consumption expressed in units of quantity are used they must tally with those derived from the family budget statistics, taking into consideration the social composition of the population. If, on the contrary, consumption is expressed in monetary units or in percentage of income, then allowance must be made for the fact that budget statistics are stated in terms of retail prices,

while production and foreign trade statistics, which afford the basis for an estimate of national consumption, are stated in terms of manufacturers' or wholesale prices.

Table I represents an attempt to compare the estimate of the apportionment among different types of expenditure of the German national income in 1913 (as presented by E. F. Wagemann in his *Konjunkturlehre*, Berlin 1928, tr. by D. H. Blelloch as *Economic Rhythm*, New York 1930, p. 40, and somewhat modified by the writer) with the apportionment of the family incomes of the lower income levels as ascertained from the family budgets of 853 families of German working men and officials (Germany, Statistisches Amt, "Erhebung von Wirtschaftsrechnungen minderbemittelter Familien im Deutschen Reiche" in *Sonderheft zum Reichs-Arbeitsblatt*, no. 2, Berlin 1909). The comparison shows the relatively insignificant place that savings and dispensable expenditures have in the budgets of the lower income classes.

TABLE I
ALLOCATION OF INCOME AMONG DIFFERENT TYPES OF
EXPENDITURE IN PRE-WAR GERMANY

TYPE OF EXPENDITURE	PERCENT OF EXPENDITURE FOR THE COUNTRY AS A WHOLE*	PERCENT OF EXPENDITURE FOR 853 FAMILIES
Food	33	40.0
Drinks and tobacco	10	5.5
Total group 1	44	45.5
Rent, including heat and light	8	18.7
Furniture and up- keep of dwelling	10	3.4
Clothing	10	12.6
Total group 2	29	34.7
Personal service	2	.6
Transportation	1	1.3
Savings	17	4.6
Other expenditures	6	13.3
Total group 3	27	19.8

* The margin of error in the percentages in this column is greater than 0.1, for this reason no decimals are given and the subtotals are larger than the exact sum of the individual items.

The percentages indicating the distribution of annual national income by types of expenditure are based on manufacturers' or wholesale prices adjusted by the addition of a mark-up in order to make them comparable with figures derived from budget statistics, which are necessarily based on retail prices. The figure for national expenditure on personal service is an estimate by the writer from the number of domestic employees. Similarly the transportation figure is an estimate by the writer from the annual

Source: The meat figure for Germany is from E. B. "Die Entwicklung von Fleischzeugung und Fleischverbrauch auf dem Gebiete des heutigen deutschen Reiches . . ." in *Jahrbuch für Nationalökonomie und Statistik*, vol. xxviii (1912) 705-60. The meat figures for the other countries are from Ballod, Carl, "Die Volksernährung in Krieg und Frieden" in *Schmalzer Jahrbuch*, vol. xxxix (1915) pt. 1, p. 77-112. The alcohol figures are compiled by Emil Straube and quoted in the *Handwörterbuch der Staatswissenschaften*, vol. iv (3rd ed. Jena 1909) p. 761. The textile figures are from Kertész, A., *Die Textilindustrie sämtlicher Staaten* (Braunschweig 1917) p. xx. The income figures are from the table adopted by the National Bureau of Economic Research from the study of Sir Josiah Stamp in *Income in the United States, 1900-19*, 2 vols. (New York 1921), vol. i, p. 85, the income figure for European Russia is based on an estimate of S. N. Prokopych cited by L. N. Litoshenko in his "The National Income of the Soviet Union" in *Quarterly Journal of Economics*, vol. xli, 1927-28, p. 70-93.

turnover and cost of material of transportation enterprises. The item "savings" cannot be made strictly comparable in the two columns. In the national economy the income withheld from consumption as capital investments appears in concrete form as commercial plants, factory buildings and warehouses; it takes the form of obligations only as it consists of claims on foreign countries, for the mutual obligations of the individuals comprising the commonwealth cancel each other when summed up. In the individual household, however, the acquisition of claims such as bank balances and insurance premiums must be reckoned among savings. The item "other expenditures" in both individual and national consumption contains the expenditures for educational, social and health needs, and in the case of individual incomes it includes gifts, payment of interest and repayment of debts.

In attempting international comparisons of consumption such variables as climate, social structure, standards of living, size of towns and divergent composition of population make generalization difficult. It is possible, however, to compare nations and periods according to per capita consumption for specific commodities. These per capita amounts may be obtained from the statistics of the aggregate consumption of single countries regardless of income levels and other classifications.

It is evident from the figures for meat and textiles in Table II that the consumption of indispensable commodities varies much more regularly with the income and depends much less upon national differences than does the consumption of dispensable articles such as alcohol.

Still more constant than the proportion spent for single commodities of urgent need, as meat, is the proportion spent for whole groups of commodities, e.g. food, serving similar urgent needs. For example, about the same percentage of income spent for food within comparable income groups is shown in four European countries investigated by the British Board of Trade.

TABLE III
INTERNATIONAL COMPARISON OF PERCENTAGE OF INCOME
SPENT FOR FOOD IN DIFFERENT INCOME GROUPS

WEEKLY INCOME IN SHILLINGS	GR. BR. BRITAIN	GER- MANY	FRANCE	BELGIUM
Under 20		68.7	62.7	66.1
20 to 25	67.3*	64.5	60.8	64.8
25 to 30	66.2	62.3	58.6	63.6
30 to 35	65.0	59.2	57.9	62.1
35 to 40	61.0	57.7	56.1	61.2
40 and over	55.9	56.3	52.8	57.0

* This figure is for weekly incomes of under 25 shillings.
Source: Great Britain, Board of Trade, *Report of an Enquiry by the Board of Trade into Working Class Rents, Housing and Retail Prices, together with the Standard Rates of Wages Prevailing in Certain Occupations in the Principal Industrial Towns of the United Kingdom* (London 1908), of Germany (London 1908), of France (London 1909), of Belgium (London 1910).

Particularly important are the attempts to use the statistics of consumption and family budgets to test the abstract hypotheses of economic theory, especially the concepts of the demand curve and elasticity of demand. It is impossible to obtain, except by dealers' estimates, a demand curve showing quantities which would be taken at a varying schedule of prices or to hold the prices of all other commodities constant while measuring the changes in quantities taken resulting from a change in price of one commodity. Nevertheless, significant approximations to these goals can be attained. Inasmuch as a rise from a lower to a higher level of income is equivalent from the point of view of the individual to a simultaneous lowering of all prices, the resulting changes in apportionment of expenditures reflect the relative importance of the commodities. The changes also give some indication of the elasticities of demand for the particular items.

The more indispensable a class of expenditure is, the more stable this expenditure remains with rising income and therefore the lower does its ratio to income fall. Inversely, the higher this ratio rises, the more surely may it be concluded that the expenditure is not physiologically indispensable but is culturally or socially conditioned. This kind of expenditure seems to be peculiarly dependent upon the "emulation urge," the effort of the individual to adapt himself to the social class above him and to separate himself from the lower classes.

On the whole, as Oldenberg has observed, the statistics of family budgets of various countries show an almost universal tendency for the percentages for various classes of expenditure to vary with rising incomes in the following manner. The proportions spent for food (Engel's law), for rent (Schwabe's law) and for heat fall. The statement regarding rent is true only in the lower income classes, however, for in the middle classes rent is an item of conspicuous consumption and the proportion spent for it rises at the expense of food. The percentage spent for dress, which likewise serves the purpose of emulation, rises as income rises. The proportion for underclothes also rises, although more slowly than that for dress. The percentages spent for transportation, drinks and pleasure articles rise, although in the highest classes of income the percentage is constant. The proportions for savings and insurance rise steadily, while those for education and personal service rise especially fast.

The tendency for the proportion spent on food to fall with rising income must also be qualified. With equal income the percentage spent on food tends to increase with growth in size of family. As, however, the consumption of children varies according to their age, consumption units which are more accurate than per capita expenditure have been devised. The best known is the Quet consumption unit, equal to the food consumption of a newborn child, although there are other scales such as the Atwater and the Lusk caloric scales and the Ammain unit based upon the consumption of the adult male. The normal need of a family may be expressed in Quets upon a basis of physiological experiments according to age and sex. The direction in which the number of people in the family, its age and sex composition and hence the Quet quantity for the family move with increasing income cannot be definitely predicted theoretically and can only be determined empirically. The fact that birth control is little practised in the lower income classes and that wages of industrial workers usually decrease after about forty years of age tends to shift the center of gravity of large families to the lower income levels. The earning power of grown children is a factor in the opposite direction as well as pensions, old age allowances and children's bonuses and possibly also the diminishing mortality of children with increasing prosperity. The family budgets of American white working men, German working men and officials and Russian peasants show the preponderance of the second group of factors, which greatly weaken the operation of Engel's law.

If account is taken of all the complicating circumstances by appropriate choice of material (by comparing only families of like race, size and age condition), then for each type of expenditure a degree of dispensability may be computed as the ratio of the percentage increase in the expenditure to the percentage increase in income as the family is passing from a certain income level to the next higher. The degree of dispensability thus indicates about how many times greater than the income increase is the increase in the particular expenditure under consideration. Table iv illustrates the results of computation of degrees of dispensability based on American budget statistics for 1918-19 (United States, Bureau of Labor Statistics, "Cost of Living in the United States," *Bulletin no. 357*, 1925).

Table iv shows that, leaving out of account the highest levels of income in which the situa-

clothing		1.24	1.28	1.15	1.07	1.40	1.36
furniture and house furnishings*		1.57	1.01	1.44	0.65	0.92	0.61
musical instruments		5.85	2.74	3.43	1.91	1.96	0.65
care of health		0.84	1.13	1.03	0.48	0.61	0.74
pleasures		3.16	2.57	2.49	2.19	1.78	2.63

tion is complicated by increase in the size of the family and beginnings of financial assistance from the children, the expenditures for pleasures grow two to three times faster than the income, while the expenditures for clothing about keep pace with the income. The expenditure for food, however, shows a rate of increase which amounts to only about one half to three fourths of the rate of the increase in income except in the highest income level. These facts become especially pronounced when the needs are still further subdivided: thus, for example, while the group "furniture and house furnishings" has a degree of dispensability which varies between two thirds and one and one half, musical instruments (principally phonographs and records) show a degree of dispensability which lies between two thirds and three and one third and in the lowest level, comprising in part young couples, rises almost to six.

The degree of dispensability shows how the rise in income affects its apportionment. At the same time it shows what effect a general and uniform change in prices would have with stationary income. Groups of expenditures with a degree of dispensability less than one, e.g. food and rent, when there is a general and equal rise in prices while the income remains stationary, undergo a fall in the quantity taken which is less than the degree of the rise in prices, so that the money outlay for this group increases. Commodities with a degree of dispensability above one undergo a lowering of total money outlay in spite of the rise in price, since the quantity taken falls faster than the price rises.

The study of dispensability can also be used to discover the effect upon the quantities taken

of an "isolated" rise in price of single commodities or of groups of commodities (as distinguished from a general rise in prices), if the expenditure upon the commodity in question represents but a small part of the total family expenditure, as is indeed the case with many single items of the family budget. When measures of dispensability computed for particular income groups are combined into a weighted average, in which the weights are derived from a study of the distribution of national income among these groups, the result obtained is the elasticity of the aggregate demand. Pioneer work in elasticity of demand, in which the demand curve of the individual consumer has been used as the starting point, has been done by A. C. Pigou, A. V. Tschayanoff (Chayanov) and F. Vinci. Various attempts have also been made to measure elasticity from the angle of empirically ascertainable prices and turnover on single markets. H. L. Moore, Henry Schultz, Elmer Working and some of the members of the United States Bureau of Agricultural Economics have done experimental work in this field. Corrections are made so far as possible for the variation introduced by the time element, leaving the pure relationships of quantity and price to be studied. As a matter of fact, however, the statistical demand curve derived from market data never succeeds in ruling the time element out of consumption and hence presents not a market demand curve but a series of points on successive demand and supply curves. This dilemma leads to attempts to isolate these two factors after the manner of the theory of probabilities, such as those recently undertaken by Vassily Leontiev (in *Welt-*

wirtschaftliches Archiv, vol. xxx, 1929, p. 1*-53*). On the other hand, the demand curve derived from the study of family budgets relating to the same period of time may be considered as fairly representative for that period and is not subject to the distorting influence of the time element. Further progress may be looked for in a mutual control of the two methods, that of family budget statistics and that of price statistics.

Consumption statistics have important applications with respect to economic policy. Not only are budget statistics essential to the determination of real incomes and changes in the cost of living; they have been used in connection with protection of workmen's standards of living in tariff revisions; and a scrutiny of the farmer's budget, considering means of production as well as commodities of consumption, is necessary for a rationalization of agriculture.

Budget statistics may also afford information regarding the economic effects of changes in income. Thus in Table v, which is based upon American budget statistics for 1918-19 and an

estimate of the distribution of national income by various income classes for the same time, we have deduced the probable increase in various types of expenditure with a rise in income. Such deductions involve of course the assumption that the families whose budgets have been studied are typical of the entire population in the same income class, an assumption the validity of which is not in question in the present instance because Table v has only illustrative value. Allowance must also be made for the fact that the "number of income recipients" (division 1) is not the same as the number of families. These increases in expenditures with a rise of income may be related to the total outlay in the corresponding expenditure category. The total outlay in the United States in 1918-19 on food, furniture and clothing, as estimated by multiplying the average family expenditure by the number of families in each income class, is as follows: \$11,000,000,000 on food, \$1,610,000,000 on furniture and house furnishings and \$5,210,000,000 on clothing. By relating to these figures the totals under IV in Table v we obtain

TABLE V
INCREASE IN EXPENDITURES BY INCOME CLASSES WITH AN INCOME RISE OF ONE LEVEL AND OF 10 PERCENT

	FAMILY INCOME LEVELS (IN DOLLARS)						TOTAL SIX INCOME GROUPS
	UNDER 900	900-1200	1200-1500	1500-1800	1800-2100	2100-2500

clothing	63	171	157	96	29	70	586

*Based on figures in National Bureau of Economic Research, *Income in the United States, 1900-19*, 2 vols. (New York 1921) vol. i, p. 132. By using the ratio of husband's earnings to family earnings and subsequent interpolations, the above mentioned figures relating to number of income recipients were transformed into a rough estimate of the number of families.

†Figures in this division indicate an increase in income and expenditure with the transition from one income group to the next higher income group. Figures under IV are a product of figures under III and the corresponding figures under I.

‡Figures in this division measure an estimated increase in expenditure with a 10 percent rise in income. The computation involves division of the figures under IV by the corresponding figures under II and multiplication of the result by 10.

the following percentage increases in expenditure with an income rise of one level: 16 for food, 27 for furniture and 26 for clothing. Similar figures for an income rise of 10 percent are: 7 for food, 11 for furniture and 11 for clothing. It appears thus that with a rise in the lower incomes the demand for industrial products, e.g. textiles and furniture, is enhanced considerably more than the demand for agricultural products, e.g. food. Similar results have also been obtained for Germany. According to the German budget statistics of 1907 one might expect from a rise in wages of approximately 25 to 30 percent a 6 to 7 percent rise in the consumption of foods, a 15 percent rise in the demand for clothing and a 14 percent rise in that for furniture. The expenditures for health and the care of the body would increase by 22 percent. As the several branches of production have different ratios of fixed costs and therefore respond with different unit costs to changes in output, such figures for percentage increase in expenditure offer a clue to the economic effect of changes of income, provided the cost schedules of the respective industries are known.

With the aid of family budgets similar estimates may be made of the savings that are to be expected from a fluctuation of income. A closer appraisal of the economic effect in this respect, however, would presuppose that one had at one's disposal a picture of the income outlay for the lower, the middle and the upper classes of income—especially a picture of the apportionment of the expenditures for capital investment and luxury needs. With such information consumption statistics might offer basic material also for the development of a national policy of capital formation and hence guidance in solving more concrete problems such as those arising in connection with the income tax.

CONTAGIOUS DISEASES. See COMMUNICABLE DISEASES; CONTROL OF.

CONTARINI, GASPARO (1483–1542), Venetian political writer and theologian. Contarini was of a distinguished family of the ruling patriciate. Highly cultured and versed in the humanism of his day, he entered the service of the Republic of Venice and concluded the alliance with Spain in 1523 and the peace with Charles v in 1529. In 1535 he was created cardinal and worked with untiring devotion for the church. He represented a clarified, deeply spiritual and ethical Catholicism which went far beyond mere piety and in his doctrine of justification closely approached the Protestant interpretation. He was papal legate at the Diet of Ratisbon in 1541, where with his characteristic conciliatory attitude he vainly strove for a reunion of Catholicism and Protestantism.

Contarini's best known work is his *De magistratibus et republica venetorum* (written 1534, published Paris 1543; tr. by L. Lewkenor, London 1599). In this work he set forth his conviction that the Venetian constitution presented the wisest and happiest combination of democratic, aristocratic and monarchic forms of

government and that in this respect Venice had even surpassed the republics of antiquity. The Republic of Venice, in his somewhat idealized description, appears as a pyramid with the doges as the monarchic apex, the senate representing the aristocratic principle and the grand council the democratic base of the commonwealth. This interpretation of the symbolic harmony of the structure of the Venetian state had a strong influence on Italian political theory of the time, and many of its phrases were repeated by the publicists. The French political philosopher Bodin, however, attacked Contarini's main thesis and pointed out the indubitably aristocratic structure of the Venetian state.

(London 1907) vol. ii, p. 110-33; Rückert, H., *Die theologische Entwicklung Gasparo Contarini's*, Arbeiten zur Kirchengeschichte, no. vi (Bonn 1926).

CONTEMPT OF COURT in Anglo-American law is generally such conduct as impedes the proper administration of justice or tends to bring it into contempt. Acts of contempt may be roughly classified as to their range as follows: (1) contempts *in facie curiae*, or "in the immediate view and presence," as they are called in the books, which consist of such misbehavior in the presence of a court as interferes with its proceedings; (2) contempts not in the immediate presence of a court but which are nevertheless explicit interferences with judicial authority, such as assaults upon witnesses or tampering with persons or property under the jurisdiction of a court; (3) contempts of process or orders in the course of an action or proceeding; (4) contempts by publication, consisting of objectionable extraforensic criticism of the conduct of a court with reference to pending causes.

The first class of contempts are usually called direct contempts; the others indirect or constructive contempts. A distinction is also made between civil and criminal contempts. A contempt is said to be civil when it is punished primarily for the benefit of a party to an action to enforce his rights and is said to be criminal when it is punished primarily to vindicate the dignity of the court itself or its process. The distinction between civil and criminal contempts, however, has been said to be vain and confusing. An act may be both and whether it constitutes one or the other depends often upon no more

than the form of the proceeding. If it is upon motion of a party to an action it is usually civil. On the other hand, if the action is taken to vindicate the court as an institution it is criminal. But to increase the confusion the contempt is not always criminal in the sense that it is a crime punishable in the ordinary course by information or indictment followed by trial by jury. The procedure in such cases is usually the summary one of immediate arrest and trial without a jury by the judge who has deemed himself contemned or by one of his colleagues. Thus the word criminal is really used to stigmatize the act of contempt as being of the kind that tends to undermine the very foundations of justice and hence as one that should be treated as a crime even if it is not. Where there is no statute that punishes the act as a contempt the courts proceed upon the theory that all superior courts of record have an "inherent" constitutional power (in England, however, only by virtue of the common law) to vindicate their authority. But where a criminal statute does exist which makes certain contemptuous acts crimes the classificatory problem becomes even more complex. There exists then a true crime of contempt. The aggrieved court has the choice of proceeding summarily as for a criminal contempt or of instructing the state prosecuting officers to lay an information or bring an indictment for the crime of contempt.

All legal systems which have reached the stage of maturity have developed closely analogous forms for securing and protecting the administration of justice. But, as must be apparent from its great complexity of classification and its exceptional procedure, the Anglo-American law of contempts is peculiar. The law of contempts has become an exceptionally prominent problem in the common law system, and great abuses have grown up particularly in the United States. While the power to punish for contempt in some form has generally been admitted, the manner and extent of its exercise have precipitated the most bitter controversies. Each class of contempts has, however, involved different considerations. There has been little or no objection to summary punishment for direct contempts in the immediate view and presence. Among indirect or constructive contempts the most vehement objections have been raised against punishments for contempt for violation of labor injunctions and against the suppression of free criticism of the work of the courts by the invocation of the doctrine of "contempt by publica-

tion," based upon the fiction that an extraforensic attack is in effect in the immediate view and presence. The summary power to punish for contempt without the intervention of a jury has been considered particularly aggravating in these classes of cases.

As far as direct contempts *in facie curiæ* are concerned, and also those extraforensic acts which are to be considered as in direct defiance of judicial authority, their range was naturally larger and they were more severely punished under autocratic conditions than at present. The powers of *coercitio* of a Roman magistrate possessed of the *imperium* were practically limitless. The judicial prerogative was similarly protected by European kings until long after mediæval times. There was, however, very little refinement of a doctrine of contempt peculiarly applicable to the judicial office only. The term contempt of court is not to be found in the Norman *Consuetudines et justicie* at the end of the eleventh century. *Contemptus curiæ*, however, is spoken of in Normandy under the French kings in the thirteenth century, but it has been said to be a borrowing from English law. At any rate, not only judicial but executive and administrative officials of the king could be contemned. What we would describe as contempt was simply one of the innumerable forms of *lèse-majesté*. There is a fable reported by Jousse to the effect that Francis I of France carried an arm in a sling for a time after an outrage had been offered to one of his magistrates, in order to show that he felt the injury in his own person. The question which the jurists debated at this time was whether the magistrate had to be "outraged" during the exercise of his functions. Farinacius thought that the punishment was the same whether the offense was committed then or afterwards, provided, however, it was *in contemplatione officii*. Menochius supposed simply that the penalty should be severer if the offense occurred during the exercise of the magistrate's function.

In England contempt of court was a well established concept before the end of the twelfth century. Indeed, it was mentioned in the early Anglo-Saxon "ofterhymes," and "contempt of justice" was considered an offense in the first half of the twelfth century. Contempt of the king's writs is mentioned in the laws of Henry I. But contempt was still conceived in a sense as a form of treason against the king. Even Coke speaks of it in these terms, as is clear from his use of the word misprision in connection with

the raising of tumults in court. Furthermore, disobedience of any officer of the king was contempt of the king: a sheriff could be contemned as well as a judge. This was natural when almost everyone in the kingdom was being "amerced" for all sorts of slights of royal authority. The doctrine of contempt was particularly invoked in England in the conflicts of the numerous inferior and superior courts for jurisdiction. Formerly it was contempt of the admiral to deprive him of jurisdiction by suing in a court other than his, and the ecclesiastical courts similarly attempted to meet the competition of other judicial bodies. Moreover, not only courts punished for contempt. There is an instance of a contempt of a bishop by the disturbance of his Grace in church. Parliament also punished for contempts not only in the disturbance of its proceedings but for any indirect disregard of its privileges, and it still has the power to punish even for constructive contempts. Today inferior courts do not possess contempt powers unless specifically conferred by statute.

The ancient mode of procedure in cases of direct contempt in England is perhaps somewhat doubtful. But it seems that summary punishment developed slowly in the centuries after the Conquest. Solly-Flood has come to the conclusion that summary process in cases of contempts committed by a stranger to a suit *in facie* did not come into existence until long after the time of Henry IV, but Fox believes that it existed by the time of Edward I. Certainly, since in some of the early cases the offender was amerced, a jury must have been summoned. The direct defiance of authority which contempts of this class imply has naturally tended to make summary punishment the rule in the modern law. Whatever objections have been raised on this score have been quickly silenced. Indeed, the courts have been criticized for failing to invoke the summary power to curb liberties of press publicity within the court room. Iest, however, the summary punishment of direct contempts be thought not merely convenient but inherent, it should be pointed out that a more deliberate procedure is not only possible but has been tried in other than Anglo-Saxon countries, where the judge merely orders the court bailiff to take the offender in charge during the sitting of the court which he has disturbed, after which ordinary criminal proceedings are commenced against him. It is interesting to note that this was precisely the mode of procedure proposed by Edward Livingstone in his famous draft of an ideal penal code

Contempts *in facie curiae* may, however, be regarded as unimportant in comparison with contempts of process or orders, since the efficacy of the courts are more seriously undermined by these. Contempts of this class are very numerous and show interesting phases of legal history. The contempt may be of oral orders, as a refusal on the part of the witness to comply with a direction to testify; or it may be, as usually, of written orders. The process or order may be interlocutory, as a summons to appear or answer interrogatories or produce documents; or it may be final, as judgments and decrees usually are. These may be simply for the payment of damages or for some forms of specific restitution. The contempts, moreover, may be committed by the parties themselves or more or less unwittingly by strangers or even by the officers of the court themselves.

It is apparent, however, that not all of these contempts need necessarily be punished to make it possible to vindicate private rights. The personal compliance of the defendant is necessary only in cases where he has to perform some affirmative act. In all other cases, the court can disregard him and order its own officers to put its judgment or decree into effect. In early law this attitude toward contempts is prevented by the treasonable implications which are deduced from them. It is not likely to be conceded that the defendant subjectively may be wholly unactuated by any motives of contempt. Moreover, in early law, in its arbitral stage and often late in its passage to maturity, since the procedure requires the observation of certain dramatic formulae by the parties, the presence and participation of the defendant is deemed necessary at all stages. His mere failure to appear and plead is considered contempt, and a judgment by default is held to be quite inconceivable. One of the tests of the degree of maturity of a legal system may be said to be the extent to which it admits the doctrine of default not only with respect to appearance but final execution. The abolition of imprisonment for debt may be regarded as the admission of default with respect to the payment of mere money judgments.

In English law suitors were frequently amerced for mere default in appearance. In the time of Henry II the failure of a tenant to attend court on summons might be punished as a contempt (Glanvill, bk. i, ch. xxxviii). In the manorial court it was contempt to depart without answering a complaint, and the same was true of the departure of a burgess from the

borough court. Well might Pollock and Maitland say, speaking of this procedure: "The law is irritated by contumacy." Indeed, down to 1875 in suits in equity appearance might be compelled by attachment even where the defendant did not have to answer interrogatories.

In English law the extensive invocation of contempt powers may be laid to the great procedural accident which resulted in the development of a dual system of courts and hindered the extension of the doctrine of default. Indeed, it is to the proliferation of equity orders by the chancellor in his struggle with the common law courts that Blackstone attributes the multiplication of contempts in English law. The contempt power was necessary to harmonize the conflicts arising from the strange anomaly of the dual system. The common law courts proceeded *in rem*: i.e. they could by the mere operation of their decrees transfer titles and could enforce judgments through their officers; hence the contumacy of defendants was of little importance. On the other hand, the chancellor sitting as a court of equity could proceed only *in personam*: i.e. he could not directly order the seizure of property or directly affect the transfer of title or secure the performance of acts. But the chancellor as keeper of the king's conscience could under the Great Seal order litigants to do or refrain from doing certain acts which would result in the surrender of their common law rights. If they chose to disregard the Great Seal they were in contempt, and imprisonment for contempt became the normal method of enforcing obedience to equitable decrees. Since these were of a very great variety, the occasions for contempt proceedings became very frequent and began to permeate the judicial system.

The countries of the common law have, however, been slowly moving in the direction of a more rational system. The English Contempts Act of 1830 allowed transfer of title by a master in cases where the defendant remained contumacious and preferred to languish indefinitely in jail. The American states began even earlier, and most of them now have statutes ranging in date from 1785 to 1901. But they do not circumvent as many cases of contumacy as they might, and even today New Hampshire, New Mexico and South Carolina appear still to rely solely upon process *in personam*. The accident of equity jurisdiction also still results occasionally in imprisonment for contempt for the mere non-payment of money, as in actions of account or more frequently in alimony cases. Curious but

more vivid illustrations are a few cases where well intentioned British dowagers have been punished for contempt when they attempted to arrange marriages between their minor children, the contempt arising from the circumstance that by law the latter were official wards of the chancellor. More serious instances are to be found in the United States in the punishment of workers for contempt for calling a strike in a business which happened to be at the time in the hands of a receiver, the contempt in this case arising from the fact that the latter is in law an officer of the court of equity.

But whether at law or equity, there can be little objection to punishment for contempt where personal compliance is necessary in the enforcement of rights. Nor can very great exception be taken to the summary nature of the commitment in such cases. The contempts, however, should be regarded as strictly civil. Indeed, it was not till the nineteenth century in England that the chancellor under the influence of the summary procedure in other cases began to regard them as "criminal" and to consider their punishment as "vindicating the court." Where injustice has usually resulted it has been due either to an anomaly in the substantive law allowing the equity jurisdiction or to the fact that strangers to the original suit have unwittingly become involved. This is particularly true in cases of punishment for contempt for violations of injunctions in labor disputes. This whole subject, however, requires a consideration of the unusual factors in such disputes and belongs more properly to a discussion of the injunction in labor cases.

A more "natural" system of execution, as it has been called, developed earlier in continental countries. Penalties were levied for non-appearance, and various fictions employed in execution at various stages of the Roman law and canon law, as well as of the Frankish and Germanic laws. The *actiones famosae* and the *missio in possessionem* may be mentioned as illustrations of this history. But the important factor is that continental countries escaped the English dual system of courts. It is true that the formulary procedure of the Roman law was suggestive of the division of function between courts of common law and equity. Since the praetor, who alone was endowed with the *imperium*, participated only in the creation of the formula and left the actual trial of the issue to the *iudex*, who was a private citizen, the latter found himself without power to compel the personal obedience

of the parties. In the imperial period, however, the twofold process disappeared in the extraordinary procedure. In the unified system only the objective necessity of securing enforcement of decrees tended to determine the scope of the process of contempt.

A marked difference between Anglo-American and European courts in the exercise of contempt powers is to be found in administrative law. Generally speaking, while Anglo-American administrative bodies can issue subpoenas they cannot themselves punish for disobedience to them. Their powers are supported either by making the disobedience a misdemeanor or by authorizing the administrative authorities to invoke the contempt powers of the superior courts. But in Germany, for instance, direct administrative penalties are permitted. Again, in Anglo-American law the fact that administrative officers are public officials does not prevent the courts from punishing them for contempt if they disregard orders made after review of administrative error. But such contempt powers are unknown in continental law. Administrative courts exist to review the legality of administrative action, but their judgments are simply declaratory. The danger of disobedience is, however, practically non-existent as a result of the hierarchical subordination of the administrative authorities.

The degree of attention which contempt by publication has attracted in England and the United States may be laid to the existence of a tradition of free speech, making the lengths to which the doctrine has been carried seem extreme, particularly as to the manner of punishment. The summary procedure is said by the courts to have an immemorial origin, but the contrary has recently been established by Sir John Charles Fox, basing himself upon some earlier researches of Solly-Flood. Although at common law the king's judges did punish for defamation of themselves as indirect contempt they never did so except in the normal course according to the law of the land after information or indictment. It was the great chief justice Wilmot who first assumed the existence of the summary power, in a case which arose from the Wilkes prosecutions in 1765. The Star Chamber was at this time undermining English justice, and Wilmot was led astray by its example. Moreover, his opinion was never actually delivered and it was not published till after his death; but meantime it had been communicated by him to Blackstone, who gave it currency in

The degree of attention which contempt by publication has attracted in England and the United States may be laid to the existence of a tradition of free speech, making the lengths to which the doctrine has been carried seem extreme, particularly as to the manner of punishment. The summary procedure is said by the courts to have an immemorial origin, but the contrary has recently been established by Sir John Charles Fox, basing himself upon some earlier researches of Solly-Flood. Although at common law the king's judges did punish for defamation of themselves as indirect contempt they never did so except in the normal course according to the law of the land after information or indictment. It was the great chief justice Wilmot who first assumed the existence of the summary power, in a case which arose from the Wilkes prosecutions in 1765. The Star Chamber was at this time undermining English justice, and Wilmot was led astray by its example. Moreover, his opinion was never actually delivered and it was not published till after his death; but meantime it had been communicated by him to Blackstone, who gave it currency in

his *Commentaries*, and the authority of the two names was such that the view has been accepted ever since.

American state courts began by assuming the existence of the summary power but were soon generally deprived of it by statute after celebrated cases in New York and Pennsylvania. The same result was effected also in the federal courts. The Judiciary Act of 1789 creating the federal courts had contained no language conferring summary jurisdiction over constructive contempts. Nevertheless, to remove all doubt they were expressly deprived of it by act of Congress in 1831. This came after a storm of indignation had swept the country when Judge Peck of the District Court of Missouri summarily imprisoned for contempt a member of the bar of that state for publishing a criticism of an opinion pending appeal in his court. Peck was impeached, but although he was acquitted (chiefly because of his age and blindness) the act of 1831 was passed providing for indictment and jury trial in all cases of contempts except direct ones. The federal courts respected this act of 1831, as is shown by two decisions in 1835 and 1842 respectively, and in 1873 the Supreme Court itself held the law constitutional.

But in 1918 the Supreme Court reversed itself in an opinion delivered by Chief Justice White (*Toledo Newspaper Company et al. v. U. S.*, 247 U. S. 402). This decision was made possible by the fact that in the course of the years in the numerous revisions of the revised statutes the remedial act of 1831 had been dismembered: one section was transported to the judicial code and the other to the criminal code. The language of these sections was affirmative, granting power in the cases enumerated. But since the background of the act had receded into the dim past, it was forgotten that the power was conferred in these cases *only*. The decision coincided with the inauguration of the era of the general suppression of free speech. It is interesting to note that in the previous year the Supreme Court had refused Congress the power to punish for contempt by publication after a rather sarcastic New York critic had launched an intemperate attack upon one of its subcommittees [*Marshall v. Gordon*, 243 U. S. 521 (1917)]. The Supreme Court overruled the existing British parliamentary precedents. The decision in the *Toledo Newspaper Company Case* encouraged a long series of prosecutions in the state courts for contempts by publication. Many of the state remedial acts which had been on the books for

decades began to be held unconstitutional. In the federal courts occurred the celebrated case of *Craig v. Hecht* [263 U. S. 255 (1923)] arising from the commitment of the comptroller of New York City by Federal Judge Mayer for contempt in criticizing the latter's management of a public utility receivership in which the city was officially interested. Only executive clemency saved the financial head of the largest city in the country from a term in jail.

Meantime in England the practise had become more moderate. While English judges technically still had the *power* to punish summarily for contempt, the more usual procedure adopted by them was the ordinary one of indictment. Mr. Justice Holmes has said, for instance: "The English courts seem to think it wise, even where there is much seeming reason for the exercise of a summary power, to leave the punishment of this class of contempts to the regular and formal criminal process." As early as 1883 Lords Bramwell and Fitzgerald in inveighing against summary attachments for contempt assumed that it did not exist in any other civilized country. It is true that of late there has been a retrogressive tendency in England, but the situation is still less troublesome than in the United States [see *Rex v. Editor of the New Statesman*, 44 T. L. R. 301 (1928)]. In republican France no special protection against denunciation is now given to either administrative or judicial magistrates. The law upon the subject is found in article 181 of the *Code d'instruction criminelle*, article 222 of the *Code pénal* and in the *Loi du 29 Juillet 1881 sur la Presse*. The French journalist who attacks a judge for misconduct is allowed to make proof of his charges in the *Cour d'Assises* before a jury.

The doctrine of contempt by publication has been criticized as giving judges a greater immunity from criticism than is desirable upon democratic principles. The critics have been editors, lawyers and business men and even officials. The law of contempt often has a reach beyond the ordinary limitations upon free speech. A judge who feels his honor impugned may like any other citizen bring an action of libel. But while in such an action a plea of truth would be a defense it is not if the charge is contempt by publication. This arises from an ancillary doctrine that a judge in such a case acts to vindicate not his own honor but the dignity of the court as an institution. This same doctrine has also resulted in the six jurisdictions of Arkansas, Georgia, Michigan, Missouri, Ver-

mont and Virginia in the rule that a judge's action may not be criticized even after the termination of a cause. But even under the normal rule laymen have very great difficulty in determining when a cause is no longer pending. After the initial verdict many cases begin to stretch themselves over a period of years, and the possibility of appeals and motions for new trials still leaves them legally pending. Moreover, many judicial actions are definitive in their nature and bear little relation to the further progress of the litigation. A ready example is the propriety of reducing, increasing or refusing bail. Again, criticism may be directed at the very fact that a cause is still pending—in other words, at the law's delay. A contemptuous publication is supposed to interfere with the functioning of the courts, but this is usually only assumed and hence exists only in a constructive sense. In fact, the rule in some American jurisdictions (and elsewhere in practical effect) is that the contemnor has the option of retracting. If his words obviously belie him he may be prosecuted for perjury, but he must be discharged as to the alleged contempt. In the language of the books, he is said to be purged. This purgation in contempt has been traced to a persisting memory of mediæval compurgation and the force of the privilege against self-incrimination.

The limitations upon the freedom to criticize the judiciary, inherent in the doctrine of contempt by publication, exist in the face of modern needs. A tremendous expansion of the sphere of social legislation to be interpreted by judges has taken place. When there is hardly any aspect of human life that is not touched by legislation, the function of the judge becomes supreme. His decisions involve not merely private rights but the public welfare. Moreover, if this is true generally in modern democracies it is especially true in the United States, where under the influence of constitutionalism the judges have become the final arbiters of legislative policy. They partake of the legislative process, but their judgments cannot be as freely examined as those of other legislative agents. Thus the right to subject the judiciary to the free play of public opinion is curtailed precisely in the country where it is most urgent that it be given the greatest scope. But not only do American judges ultimately decide social issues of public policy under the power of judicial review: they also, particularly in the federal courts, administer enormous business corporations and railroads in equity receiverships and thus control a great deal of the national wealth.

In this process of business reorganization they act in an administrative and not a judicial capacity, and it should be noted that administrative tribunals do not generally possess contempt powers of any kind. The mere fact that a business is passing through judicial hands does not alter the problem of oversight.

The present temper of the courts is such that probably only constitutional amendment can abolish the summary powers over extraforensic contempts where they are exercised. Impeachment as a remedy is cumbersome and uncertain and too political in its nature. Moreover, it can be used only to remove a judge who is obviously corrupt and has acted in manifest bad faith. The adoption of the recall of judges has not been urged as a remedy for the abuses of contempt powers, but it is interesting to note that where recall has been adopted the tendency has been to weaken the underlying structure of the law of constructive contempt.

CONTESTED ELECTIONS. The validity of an election may be attacked on various grounds; for example, because of misconduct on the part of the election judges or corrupt practises on the part of the successful candidate or because the latter is ineligible or has profited by the casting of illegal votes. In the United States under such circumstances the election is said to be "contested." English authorities, whose terminology has in general the merit of greater precision, prefer the term "disputed" or "controverted"; for with them, technically speaking, an election is contested whenever more than one candidate has been nominated for the same office.

There are two distinct methods of settling contested elections. The function may be regarded as political, the decision then being entrusted to political agencies; or as judicial, jurisdiction being conferred upon the courts. At common law *quo warranto* affords an appropriate remedy by which a candidate may contest the validity of his opponent's election, that is, he may ask for the removal of a usurper and possession of the office for himself. Nowadays, however, this method has been supplanted by constitutional and statutory rules of procedure which vary not only in different countries but with respect to different offices. Legislative bodies that possess so-called sovereign power, like the American Congress and state legislatures, judge the election of their own members and of important executive officers as well. In the case of subordinate offices contests are referred to the courts.

In France the National Assembly has held final authority over election contests since 1789; and the constitution of 1875 makes each chamber judge of the eligibility of its members and of the regularity of their election. The members of a new Chamber of Deputies are divided by lot into eleven sections called *bureaux*. The election returns and all documents bearing upon them are distributed among these *bureaux* for examination through the medium of small committees. A report made to the Chamber on each election shows whether the candidate was eligible, whether he obtained the required vote, whether the electoral operations were in accordance with the law and whether there were any circumstances, such as corrupt administrative influence, that would vitiate the election. If the facts

prove difficult to establish, the Chamber may authorize the appointment of an investigating committee of eleven members, one named by each *bureau*, with power to compel the attendance of witnesses and put them under oath. The Chamber acts finally, without any restriction upon its prerogative. It has usually been influenced by partisan considerations rather than by a nice sense of justice, and hence proposals have been made to transfer the function to the highest administrative court, the Council of State.

With respect to French local assemblies the procedure is laid down by statute. The administrative courts settle all contests. Where a seat in a municipal council or district (*arrondissement*) council is concerned, the complaint goes before the administrative court of first instance, the prefectural council, with right of appeal to the Council of State; and the same procedure applies where the election of a mayor or adjoint by a municipal council is called in question. The Council of State has original jurisdiction over contests affecting the general council (assembly of the *département*), which formerly (before 1875) settled them itself.

The practise of France and other countries has been derived mainly from English precedents; and therefore a special interest attaches to the experience of the mother of parliaments over a period of three centuries or more. The House of Commons first clearly asserted its right to judge disputed election returns late in the reign of Elizabeth. That it took this position in the face of a statute of 7 Henry IV, which gave jurisdiction to the lord chancellor, indicated a sense of growing power and a determination to get free from executive control. Although James I, stubbornly resisting the new claim, forced the House to accept a compromise in the Buckinghamshire election case of 1604, from that time the jurisdiction of Chancery was never asserted and that of the House was never questioned. The House now had the means of counteracting the abuse of royal authority in the management of elections. Along with it, however, came the abuse of partisanship. Political interest swept aside the dictates of justice. Each vote upon disputed returns became a test of party strength, irrespective of the merits of the case. It involved the fate of the ministry. So Walpole fell in 1742, his defeat in the Chippenham election case being regarded as tantamount to a vote of want of confidence. The scandals were so flagrant that in 1770 the Grenville Act took the power of deci-

sion from the House itself and transferred it to a committee of fifteen members. The elaborate process required for the selection of the committee was designed to secure impartiality; but, while it did bring about a considerable improvement, the old evils by no means disappeared. Nor did public opinion, growing more sensitive and critical as the nineteenth century advanced, find the later modifications of the Grenville plan satisfactory. If the reconstituted committee showed less partisanship it nevertheless did little to check the corrupt use of campaign funds and rendered decisions that were uncertain and contradictory. At last in 1868 by a complete change of principle the matter was placed in the hands of the High Court of Justice. Two judges (only one before 1879), who are chosen by the other judges of the court, try the election petition in the borough or county where the issue arises and certify their decision to the speaker of the House. The decision is in effect final and authoritative; for while the House is legally competent to override the judges and substitute its own jurisdiction it never does so.

In the United States every state constitution contains the provision that each house of the legislature shall be judge (sometimes "sole" or "final" judge) of the qualifications and election of its members. This rule had been firmly established in colonial practise before the close of the seventeenth century. The courts are disposed to interpret it narrowly. Thus, maintaining that the power is vested exclusively in each house and cannot be delegated, the supreme court of Massachusetts in 1916 (*Dinan v. Swig*, 223 Mass. 516) held unconstitutional a statute under which three judges of the superior court could void an election because of corrupt practises. Nevertheless, a number of states, including Wisconsin and Oregon, have adopted the English procedure. The court certifies its findings to the secretary of state; he in turn transmits them to the presiding officer of the appropriate house of the state legislature or Congress; and the house itself remains legally free to accept or reject them. In more than forty states the legislature also judges the election of state executive officers. The only remaining exception to the jurisdiction of the courts is found in cases where, as in California, the legislature is authorized to invest city councils with the power to judge the election of their own members and of municipal executive officers; and even when this power has been conferred the concurrent jurisdiction of the courts remains,

unless the legislature has unequivocally manifested the intention of taking it away.

The federal constitution makes each house of Congress "judge of the elections, returns, and qualifications of its own members." It provides further that the votes for president and vice president shall be counted in the presence of both houses and that when a majority vote is wanting the House shall choose the president and the Senate shall choose the vice president. But the constitution does not say who shall count the electoral votes or how their validity shall be determined. The matter has therefore been regulated by statute; and the existing procedure, established in 1887, is so well designed to meet possible complications that such a menacing situation as developed in the disputed presidential election of 1876 cannot occur in the future. In judging the election of their own members House and Senate alike have usually acted upon considerations of party advantage. Thus between 1865 and 1903 the majority party decided 82 of 91 House contests in their own favor. In the Fifty-first Congress the Republicans, finding their majority inadequate, seated eight more of their partisans in the place of lawfully and regularly elected Democrats. In view of such circumstances Speaker Reed observed that "the decision of election cases invariably increases the majority of the party which organizes the House and which therefore appoints the majority of the Committee on Elections" ("Contested Elections" in *North American Review*, vol. cli, 1890, p. 114). In 1895 a report from the committee on elections itself declared that decisions were made not according to justice but by mere numbers and that during the preceding twenty years 45 seats had been taken from the minority and substantially none from the majority. A defeated candidate, relying upon partisan support, would bolster up dubious charges and contest an election on the most flimsy pretexts. In recent years, however, perhaps as a consequence of secure Republican preponderance in the House, scandalous perversions of justice have not occurred. In addition to partisan considerations another abuse has been delay; in some cases a sitting member has been unseated only a day or two before the close of the congressional term. But since 1924 a House rule has required the several elections committees to report on all contested elections within six months after the first assembling of the Congress.

The adoption of the English system—the trial of election petitions by the courts—has several

times been proposed. In 1895 the House committee on elections made a strong argument in favor of the change; in 1923 a bill was reported giving the Circuit Court of Appeals jurisdiction. So competent an authority as Robert Luce endorses the plan without qualification. "Not a single reason of weight militates against it," he says, "and it ought to prevail" (*Legislative Assemblies*, p. 204). After all, the traditional parliamentary prerogative originated at a time when the king exerted pressure in elections and when the judges, being subservient to him, were distrusted. It is now something of an anachronism. No doubt the English system has revealed certain defects. Aside from the delay and expense which litigation ordinarily involves the judges sometimes rest their decisions on technical or trivial points; and the petitioner who has charged extensive corruption but failed to establish specific instances to the satisfaction of the court may find himself sustained on the ground that his opponent paid the railway fare of a single non-resident voter. But at least the judges have kept themselves free from any suspicion of political bias. Public opinion would not tolerate a return to the old system. Indeed, the efficacy of the laws against electoral corruption depends upon their enforcement by the courts and upon the automatic forfeiture of the guilty candidate's seat. English practise has been imitated not only by the dominions but more recently by European countries as well. The constitutions of Austria and Poland give jurisdiction to the supreme court; that of Czechoslovakia, to an electoral court. The German constitution provides for a small electoral commission of judges drawn from the administrative court and of members of the Reichstag.

CONTINENTAL SYSTEM. This term (in French usually *blocus continental*) has been given to Napoleon's attempt to crush Great Britain by

means of commercial war. The system was formally inaugurated by the decrees of Berlin, November, 1806, and Milan, December, 1807, but it had already begun at the outbreak of the war with England in 1803 and its origin is much earlier even than that date. The British countermeasures, especially the series of orders in council issued in 1807, are also often included under the term.

The measures of Napoleon were ostensibly framed as reprisals against the infringements of neutral rights through the British "paper blockade," but the military reason for them was the mastery of the seas on the part of his enemy. His conquests of the coasts of the continent appeared to open up possibilities of a plan which he had long entertained—to exclude from the continent all British goods as well as commodities belonging to British trade and shipping, especially colonial produce. The economic principle underlying the plan was intensely mercantilist and the reverse of that which dictated the blockade of the World War of 1914-18. Britain was to be ruined by being prevented not from satisfying her own needs but from satisfying the needs of the continent; her exports as well as her carrying trade were to be strangled; she was to be "vanquished by excess." The means was to be a self-blockade of the continent. The series of orders in council which constituted the British reply is less easily summed up by a single formula. But in the main it was intended to meet the French plan squarely: as France had said she would have no trade with England, she was to have no trade except with England. Hence the adoption of the rule that all ships must call at a British port. This rule, however, was more than a mere reprisal; it was also in agreement with the *entrepôt* principle which was at the basis of the old colonial system.

Napoleon had many reasons for believing that his plan would ruin England. To begin with, he held the fundamental mercantilist idea that an abundance of commodities was a national calamity. In addition he believed that an adverse trade balance and a consequent outflow of precious metals would be particularly dangerous at that time to the credit system of Great Britain, the weakness of which seemed to have been borne out by the Bank Restriction Act of 1797. And he expected that the wealth of the country, generally believed to center in the Bank of England, and the credit of the state, already endangered by an enormous national debt, would follow the credit system into the abyss.

He foresaw labor disturbances also, and in his eyes these constituted a more serious menace than many lost battles.

Actual developments neither proved nor disproved the validity of Napoleon's reasoning, although there is every reason for doubting it. In spite of his apparently unlimited political power Napoleon was unable to carry out his plans, owing to the widespread desire of the populations he ruled for British and still more for colonial goods. Hardly anyone, consequently, could be relied upon to carry out the system, and the *autos-da-fé* and other spectacular measures against the smuggled commodities very often proved a farce. The prevalent corruption of the administration in most countries made smuggling an ordered and extremely lucrative trade, especially in the countries not under the emperor's immediate sway. In this situation Napoleon, through the so-called Trianon and Fontainebleau policy of 1810, entered upon a sort of competition with the smugglers, admitting colonial goods on the payment of duties calculated to be just below the cost of smuggling. These measures were based upon an enormously extended system of licenses for such trade as was officially prohibited. The use of licenses, as well as false ship's papers and other bogus documents, was even greater on the part of Great Britain. More than 18,000 licenses were issued by that country in 1810 and the greater part not only of British but also of international maritime trade in general was carried on by means of them. There was a fundamental difference between the two, however, in that British licenses were breaking through the self-blockade of the continent, while those issued by Napoleon were undermining the system he had hoped to establish. The Trianon policy converted the continental system into a gigantic provider of revenue, deflecting it from its beautifully conceived purpose of waging commercial war on extreme mercantilist lines. Upon the fall of Napoleon the system was forthwith abolished.

The economic consequences of the Continental System cannot be rated as very important. For France it acted as a system of excessive protection, but with the important disadvantage that it checked the supply of raw materials to the industries which it was fostering, especially cotton. The only important results were the establishment of some chemical industries, principally the Leblanc soda process, and the furthering of beet sugar production. The technical foundation of the latter industry had been laid

earlier, but it did not survive the reopening of the frontiers in 1814. Only a few years later, however, it took on a new lease of life, so that the embargo may have had an influence on its development. As to the rest of the continent, many places suffered through the ultraprotectionist policy of France proper, which prevented the use of that country as a substitute market for those which had been lost. This was especially true of the Grand Duchy of Berg, the present Ruhr district. As a whole the Continental System retarded the adoption of British methods, begun before 1789, and contributed through this to the lateness of the industrial revolution outside Britain.

CONTINGENT FEE is defined as "a fee, the payment of which is conditioned upon success in a proposed litigation, the fee to constitute a certain percentage of the amount recovered or a fixed sum to be paid out of the amount recovered."

The history of legal fees in general has conditioned the attitude of the law toward the contingent fee. Fees were an issue even in the Roman world. The patron who had accepted the promise of fealty from the client was obligated to give him assistance and advice without payment. Later it became customary for the client to offer a gratuity to his patron in advance for his services. Although there was no legal obligation to pay the gratuity, those litigants who were unable to do so could not obtain representation in the courts. The Cincian law and the laws of Augustus, which were designed to correct these abuses and forbade the acceptance of gratuities, proved ineffectual. They were followed by Trajan's ruling that no advocate was to receive his fee until the cause was decided. The patron usually received a share of the spoils which he collected for his client, a custom which closely resembles the modern contingent fee.

In England the history of the contingent fee is the history of champerty and maintenance. In early feudal days a suitor frequently assigned his claim to some powerful lord for the purpose of obtaining the lord's influence at court. The lord,

of course, would be compensated by participation in the recovery. Juries were largely made up of dependents of the lord and, as Blackstone said, perverted "the privileges of law into an engine of oppression." The *Statutum de champertie* and *Statutum de conspiratoribus* resulted, carrying severe penalties against these practises.

These influences of Roman law and early English law have left so deep an imprint in English jurisprudence that the statement of Blackstone concerning the payment of counsel fees may be regarded as the attitude of the English bar today: "and so likewise it is established with us that a counsel can maintain no action for his fees; which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary or hire but as a mere gratuity, which a counsellor cannot demand without doing wrong to his reputation" (bk. iii, sect. 28). By statute a solicitor is prohibited from stipulating for payment on a contingent basis or from contracting for a share of the subject matter of the suit as his fee. The laws against champerty and maintenance have, however, been greatly modified.

In America the courts at an early date repudiated the English practise and held that fees for legal services were a proper subject of contract, for the breach of which suit could be brought. This ruling and the modification of the strict common law rules concerning champerty and maintenance were followed by the development of the contingent fee. In the Field Code enacted in New York during the middle of the last century "a fair contingent fee" was legalized and contingent fees have been sustained by the courts in all our states. In some New England states it has been held that contingent compensation is not permissible when the compensation is confined to an interest in the thing recovered. At the same time an attorney is allowed a right of action against a client, and the pledging of the proceeds of the suit as security for the payment of the attorney's fee is permitted. Some of the southern and middle western states have adopted the rule that the attorney may neither pay nor agree to pay any part of the cost of litigation, although he may contract for the contingent fee in general. These distinctions have little value.

The contingent fee came into prominence in the United States in the latter part of the nineteenth century. The expansion of industry and the machine, together with the neglect of safety measures, caused a large number of in-

dustrial accidents. Injured workers were unable to afford competent legal assistance. The legal aid societies, partly because they feared the antagonism of the bar and partly because of lack of funds, refused to take suits for personal injuries. They argued that the plaintiffs could obtain a lawyer's services through a contingent fee arrangement. With the accidents resulting from the development of motor traffic the contingent fee became an even larger factor in legal practise.

Discussion naturally began to center upon its abuses, of which the most obvious are the following: (1) it tends to corrupt the fiduciary relation of attorney and client, for the attorney has an interest in the case which may at times differ from that of his client; (2) it affects his attitude toward the court, which becomes that of a litigant rather than that of an officer of the court; (3) it brings the administration of law and the legal profession into public disrepute; (4) finally, it encourages unnecessary litigation. Cases are often manufactured and clients induced to sue for injuries which they themselves regard as negligible. "Ambulance chasing" has arisen, a system in which physicians, the police and lawyers work together on a split fee basis to procure clients in accident cases. Even this is justified by some lawyers on the ground that thereby ignorant persons are informed of their rights and prevented from giving releases to insurance company agents who generally arrive on the scene of the accident at the same time as the "ambulance chaser." The contingent fee arrangement and its accompanying evils including solicitation are of less importance in non-accident litigation.

Despite its abuses the contingent fee serves several important purposes. It is instrumental in enabling young lawyers to get a start. Moreover, it permits the poor litigant to obtain competent legal service which he could not otherwise afford, particularly in personal injury cases in which the defendants are frequently large corporations and railroads or are represented by insurance companies. Unfortunately it affords unscrupulous lawyers an opportunity to drive unconscionable bargains at a time of stress and excitement. While no rule can be stated categorically and each case depends upon its own facts, it may be said that from a quarter to a third of the amount recovered is usually regarded as a fair compensation. Often a much larger percentage is charged.

The problem of the contingent fee in industrial accidents has been eliminated in a number

of states by workmen's compensation. It has been suggested that a similar insurance plan to cover automobile accidents be inaugurated, under which all drivers would have to subscribe to a fund from which fixed compensation would be paid to persons injured, regardless of where the negligence lies. There are, however, constitutional limitations affecting such a plan. The extension of legal aid is an alternative remedy which would be less satisfactory in that it would not appreciably reduce the enormous amount of accident litigation. The cooperation of indemnity companies would of course help to alleviate the worst features of the present situation. The consensus of opinion of the American bar has been that the best solution of the problem is the control and regulation of contingent fee agreements by the courts and that solicitation should be penalized.

In New York the subject was under discussion during the so-called Ambulance Chasing Investigation in 1928. As a result rules were adopted by the Appellate Division of the Supreme Court tending toward closer supervision of contingent fees by the courts. Attorneys must now file the agreements for contingent fees in court within ten days after they are made.

CONTINUATION SCHOOLS. Generally speaking, continuation schools are public or semipublic educational institutions on a part time basis for young persons between the ages of fourteen and eighteen who have completed attendance requirements of an elementary school and are not attending a course of full time education. These schools are usually provided for young people employed in manufacturing, commerce and allied industries but in certain countries are extended to those in extractive and agricultural occupations and even in domestic

service. The term is usually applied to day schools to distinguish them from evening courses. Proponents of continuation education emphasize the necessity for transfer from evening to daytime attendance as a mitigation of excessively long hours for the child laborer.

The provision of continuation education has been stimulated by a number of causes, the most immediate and direct of which was probably the decline of a system of supervised apprenticeship. Fundamentally, however, there is a more or less clearly defined realization of the obligation of the community to provide some form of education and guidance for the young wage earner whose limited schooling is inadequate preparation for life and whose entry into industry coincides with the difficult period of adolescence. Three purposes, not always separable, have usually been expressed for continuation education: education for industry in general or for some particular occupation therein, education for citizenship and education which seeks the fullest development of the individual. In practice, however, there has been wide variation both from time to time and from country to country in the emphasis on vocational, cultural or civic courses, in provisions for compulsory or optional attendance and in the extent to which the schools are supported by the state or by contributions from industry. This variation is interrelated with current concepts of the purposes of education in general and of industrial education in particular, and of the mutual relations between the individual and the community. Continuation education in some form has been adopted in twenty-five or more countries; it has been developed furthest in Germany, Great Britain and the United States.

The long history of German continuation education reflects shifting changes in social values. Its origin was a result of the efforts of religious organizations to provide religious education in evening courses for young wage earners. By the Imperial Industrial Ordinance of 1869 empowered municipalities were given the authority to require employers to permit workers under eighteen to attend the *Fortbildungsschulen*, as they were known. By 1914 twelve out of the twenty-six states had enacted compulsory continuation school laws, while others had local requirements. Critics of the German system prior to the World War found it too narrow in scope and likely to reinforce rigid economic and industrial limitations. The pioneer work of Dr. G. Kerschensteiner in Munich and

the sweeping reforms brought in by the German Republic and the constitution of 1919 broadened the scope of the curriculum of the German continuation schools and extended it to cover the needs of young wage earners up to the age of eighteen. Attendance of eight hours a week for four years is the general requirement. Although the pupil's program is based generally on the occupation in which he is engaged in order to develop his skill therein, the *Berufsschulen*, as they are now called, stress the rights and duties of citizenship. These involve relationship to the political state, social legislation, the purposes and procedure of trade unions and the like. Some idea of the extent of this type of education is given by the 1926 figures for Prussia, which comprises two thirds of Germany. Out of a total of 12,314 schools for 1,105,901 students, 2200 industrial schools provide training for 745,196 students, 9697 agricultural schools for 221,373 students, 308 commercial schools for 109,423 students, 54 domestic economy schools for 15,229 students and 145 mining schools for 14,680 students. The tendency during the period of acute unemployment has been to make attendance regulations more stringent, in order that the young unemployed worker may not go completely adrift.

The systems of Czechoslovakia, Austria and Switzerland are similar to the German in their comprehensive scope and the requirement of compulsory daytime education.

France provides for voluntary continuation education (*enseignement postscolaire*) in public and private *cours d'adultes* for pupils above the age of thirteen. These courses continue general elementary education and are adapted in some places to local needs. Since 1917 several unsuccessful efforts have been made to introduce compulsory attendance. In industry and commerce employees under eighteen are required to attend part time schools, not necessarily during the day, for three years from one hundred to two hundred hours a year. The schools may be provided by public authorities or by employers subsidized by the state. Similar provisions exist in rural areas, where voluntary continuation courses are offered in agriculture and household management.

Continuation education in Great Britain has aroused considerable interest, and the Fisher Act of 1918, embodying recommendations made earlier by several special committees, provided for compulsory attendance at continuation schools of boys and girls between the ages of

fourteen and eighteen not attending a full time school. For financial reasons the Board of Education has postponed the fixing of the appointed day on which the provision shall go into effect. As a result of the economic crisis of 1921 and 1922 even those local authorities, with one exception, who had voluntarily adopted a compulsory system repealed their provisions. At the present time a few large communities have voluntary continuation schools; in the rare instances where attendance is compulsory it is not necessarily limited to the daytime. Thus in 1926-27 out of a total of 750,500 students in continuation schools in England and Wales only 24,000 were attending day schools. In England, however, the emphasis in the continuation schools, as in the whole program of workers' education, is on those courses which are intended to develop the individual, and vocational and technical courses are merely incidental. This emphasis on general education is seen in the movement for "secondary education for all."

Nowhere has vocational education been so strongly stressed or so well developed as in the continuation schools of the United States. The development of continuation schools received a strong stimulus after the passage in 1917 of the Smith-Hughes Act, which provides federal aid for full and part time vocational education and makes this aid conditional on the establishment of part time schools. In 1928 there were 400,000 part time schools, of which 320,000 were general continuation schools. Twenty-seven states have passed laws requiring compulsory attendance at continuation schools, but the reservations included in these laws are generally so extensive as to limit their general practicability. In addition to numerous exceptions on personal grounds the attendance is required only in areas with a certain population or with a definite number of available pupils or where schools exist. This results in the omission of agricultural and other groups. In thirteen states attendance is required between the ages of fourteen and sixteen, in eight between fourteen and eighteen, in two between sixteen and eighteen, in two between fourteen and seventeen, in two up to eighteen, in one up to seventeen and in one no age limits are specified. Most frequently four hours of attendance per week, between the hours of eight a.m. and six p.m., are required, with a maximum usually of 144 hours per year. In Wisconsin, where the system of vocational education has been very well developed, pupils of from fourteen to sixteen years of age must attend six half days a

week; those sixteen to eighteen, eight hours a week. In the better schools, especially in Wisconsin, Massachusetts and Pennsylvania, attention is paid to vocational guidance and the avoidance of blind alley occupations; and this may at times require the shifting of the student from studies centered about his immediate occupation. The building up of a teaching staff which is especially equipped for such instruction has occasionally received special consideration. In 1928 about 9000 teachers attended training courses for teachers in part time and continuation schools. Local studies of the effectiveness of continuation school education, resulting in the conclusion that it is least useful for the fourteen to sixteen-year age group because of the limited employment opportunities open to them, has reinforced the advocacy of compulsory full time education until the age of sixteen.

The cooperation of the industrial and educational groups and institutions whose functions are closely allied to those of the continuation school has taken varied forms and has met with varying degrees of success. On the whole, labor has expressed its approval of the principle of continuation education. Early in its history the American Federation of Labor went on record in approval; the Youth Program of the International Federation of Trade Unions adopted in 1928 asks for the "introduction of compulsory vocational education until the completion of the eighteenth year, such instruction to be in working hours." Generally labor has qualified its approval by the provision that such schools be under public auspices and has linked it with a demand for a higher age requirement for entry into industry. English labor, for instance, has specifically condemned employers' "work schools." In most European countries characterized by a high degree of trade union organization the local educational committees have included union representatives as well as those of the employers. In some countries, as for instance in Austria, grants from employers' and workers' organizations are accepted; and in some cases of deficits in the total budget, to which the state contributes, levies are made against employers. In the United States one of the obstacles confronting the continuation schools is the refusal of employers to engage workers who are subject to compulsory attendance regulations, and the employer, parent and child frequently object to the reduction in earnings through school attendance.

Criticism of continuation education centers about the controversy over the type of education

to be given. Even where there is a general preference for emphasis on vocational training, however, many questions arise from the dilemma in which the schools find themselves because of the necessity to strike a balance between a broad industrial training and the limited possibilities for its utilization in existing employment opportunities.

CONTINUITY, SOCIAL. This concept is used to indicate that existing culture forms are outgrowths or modifications of antecedent forms. It is theoretically possible to take civilization as a whole and trace its existing complexes back to relatively simple beginnings and thus to show that the history of man's achievements is on the whole unbroken. Culture in its entirety may thus exhibit unbroken development, but

within any given culture group there may be an element of discontinuity in the taking over of alien borrowed traits which bear no necessary relationship to antecedent stages of the given culture itself. Thus the horse, suddenly introduced by European invaders, was distinctively novel to American Indian culture. From the point of view of the borrowers such instances may be regarded as cultural mutations. Although the continuity concept is used in referring to a specific culture group as well as to the history of culture as a whole, there is a tendency to confine it to the latter. The perpetuation and continuity of culture, whether of an entire civilization or of some specific institution, rest fundamentally upon the process whereby the past is brought into the present and extended into the future. Since every social group possesses a certain culture and every social institution contains a culture complex, social continuity becomes a phase of cultural continuity.

The development of the concept of social continuity has been greatly facilitated within the last half century by research in archaeology and history which has greatly extended the time perspective of man's achievements in culture building. The "thread of history," once traced back only to the relatively recent literate civilizations, is now followed as far back into man's prehistory as the problematical colithic age. The archaeologist, working with remains of the non-perishable traits of preliterate cultures, and the historian, concerned with those of the literate peoples, have been able to reconstruct the process of gradual accumulation of culture from its simple stone age beginnings. In utilizing these materials social theorists have considered both man's culture as a whole and certain specific culture groups and as a result have stated in various terminology the continuity concept, briefly epitomized by Wissler as "tribes may come and tribes may go, but culture goes on forever."

Perpetuation of the culture whereby continuity is achieved may be through processes that are unorganized and informal or highly systematized and formalized. In all culture groups education in its broadest sense is the product of both types. In general, it may be stated that among preliterate peoples the un-directed processes predominate, while with the acquisition of writing the educational process becomes more consciously planned. In the simpler societies social values, attitudes and mores may be deliberately reinforced by elabo-

rate ceremonials, but the perpetuation of the essential knowledge is more casual. In fact, the natural tendency of men in society to imitate or repeat what is already being done makes inertia a fundamental force for the persistence of cultural forms. Simple tasks and play, often in imitation of adult activity, occupy the children's time, and through these and especially through the play, in which adults often join, the child acquires the basic practical techniques, information and knowledge of the folkways he is to utilize in later life. In preliterate cultures the education whereby social continuity is maintained is not specifically institutionalized; rather it develops as a by-product of activities involving the several institutions with which children have contact. Nevertheless, conformity to traditional patterns of group behavior is informally achieved through the pressure of social approval. The child learns to respond to the expectations of those about him, and failure to meet these expectations results in a loss of prestige, actual censure or even physical punishment. In this manner the folkways are inculcated and maintained and become, as Sumner pointed out, social forces inducing conformable behavior. The sensitivity of individuals to group norms of behavior may also be consciously and deliberately utilized to develop this conformity.

In literate societies social continuity involves not only the mechanisms found among preliterate peoples but others that are associated with the art of writing. Traditions and techniques multiply with passing generations, since the record of the past is handed on with progressively greater effectiveness. Among primitive peoples the span of personal knowledge of the group and its ways is limited approximately to the years intervening between the great grandfather and the great grandson, but this inevitable circumscription of tradition disappears when written records are possible. Characteristic of literate societies, accordingly, is the development of formal institutions which serve systematically to select, preserve and transmit phases of the ever augmenting cultural heritage. The pressure of folkways, mores, ceremonials and incidental and casual training of the young by their elders and their associates, as in the telling of stories, myths, fables and proverbs, still are important, but perpetuation of the culture becomes more systematic. The function of formal education in schools or as an adjunct of other institutions is to impose

systematically on members of oncoming generations not only the technical knowledge necessary for life in the group but also the approved values and attitudes which surround social institutions.

In all culture groups the evaluational and attitudinal phases of the culture are acquired gradually. These assume meaning as the outgrowth of daily interaction between group members in which expected types of behavior are established in the child's mind, and these meanings are perpetuated in the same process of interaction among adults. Experience is the teacher, and learning follows the daily contacts in which the inexperienced perceive, in terms of approval or disapproval by their associates, how they may best adjust their behavior to social life. Few institutionalized forms of learning are as potent in perpetuating a culture as are these interactions of the child beginning in what Cooley has termed the primary groups. Here the norms of behavior are imposed upon the group members; habits and attitudes, which eventually will become the stimuli to the behavior of others who follow, are implanted without questioning and thus social continuity is achieved.

In complex societies, on the other hand, technical aspects of culture are more easily acquired in a formal and systematic manner. Modern educational systems are the agencies through which such essential knowledge is implanted and perpetuated. Formal, institutionalized education may also contribute in implanting attitudes and values and in establishing the mores.

In the transmission of the culture, whether formally or incidentally as in the process of social interaction, a selective factor operates, since not all technical and routine knowledge from the past nor all attitudes are to be retained. There is often a conflict of interests involving the persons interested in the perpetuation of the mores. In simple societies these may be no more than the natural vested interests of adults centering in the desire to maintain status privileges, but in societies that are more complex the vested interests become diversified and intricate. In these primitive cultures crude and cruel disciplinary means are employed to secure the absolute subservience of the young to these interests. Social stratification and differentiation involve conflicting attitudes which compete not only among adult groups but also in the process of transmission to the young. Out of such con-

flict arise numerous other devices designed to induce conformity, such as appeals to various loyalties, use of prestige factors, ceremonials, patriotism, veneration of tradition, control of agencies of news dissemination, and propaganda in its multitudinous guises. These assume great importance in literate cultures with their extensive culture bases and increased facilities of communication and dissemination of ideas.

Some culture phases have a more definite continuity with the past than others. What Bagehot called "the cake of custom" covers folk beliefs, mores, codes—the attitudinal and evaluational phases of the culture—more than it does techniques and the field of applied knowledge. The persistence of traits from earlier periods into a period when conditions of life have been modified gives rise to social conservatism. Conservatism is also enhanced by the presence of survivals, traits that persist after their original utility has been exhausted. Even though the inner meanings of symbols may have changed, the external forms frequently endure, thus recalling older behavior patterns in contemporary times.

Social continuity underlies social stability. It is to cultural life what habit is to individual life or biological heredity to the continuation of the species. It makes possible orderly change and usually inhibits the chaos that would follow were social changes induced without reference to existing forms and patterns. Because of social continuity group members come to expect definite types of behavior which, while not rigid, do not normally change with an abruptness that makes adjustment to group life difficult or impossible. Social change results from the pull between innovating tendencies and tendencies that make for the continuation of existing culture forms. These latter, constituting the conservative forces, have their existence in the fact that there is continuity in the cultural development of any social group.

CONTINUOUS INDUSTRY. The term continuous industry is used to characterize an industry in which the operations are carried on day and night, without interruption, over extended periods and in which the necessary labor is applied in a sequence of shifts. In earlier types of economic organization such industries were few and consisted of those in which basic technical conditions did not permit interruption, such as marine transportation, blast furnaces and the like. In modern times such industries as canning and newspaper publishing have come to be operated on a continuous basis, although the forces which have induced them to become so arise out of a strongly competitive society and are economic rather than technological in nature.

Distinction should be made between continuous industry and continuous processing. The former connotes continuity in time of those processes, continuous or intermittent, which characterize the industry; the latter connotes a continuous flow of materials from one process to another whether the industry be continuous or intermittent. The term continuous processing identifies a flow of materials from one to another of an integrated series of sequential operations. The continuity is in the flow of materials from one operation to another.

An industry may be continuous because of one factor or a combination of the following factors: inherent technical impossibility of interruption, as in the operation of ships between distant ports; characteristics of the processing, in which interruption is technically possible but not economically practicable, as in some metallurgical and chemical industries; seasonal characteristics of the industry based on perishability of the product, as in the beet sugar and canning industries; customary consumers' demand involving continuous, uninterrupted production or service, as in public utilities, transportation, hotels, baking, newspapers; the desire in a competitive industry to take advantage of a peak of variable demand for a product, as in the textile industry; the desire for full utilization of special investments in plant and equipment before obsolescence of product or of facilities; national emergency, as the urgent needs of war; a force not yet actual but emerging, the belief that the social burden of labor can be alleviated by con-

tinuous utilization of equipment accompanied by a distribution of the attendant labor among workers organized in shifts.

The development of mass production in American industry during recent years has been accompanied by an increase of both continuous operating and continuous processing, inasmuch as the relatively larger quantity of product which is produced in a given time involves an intensification of processing. In any competitive enterprise representing a large investment of capital in costly equipment of specially designed and constructed single purpose machines there exists ipso facto the strongest incentive for maximum utilization of the equipment; and likewise, because of the correspondingly large investment of working capital in materials, a strong incentive for reduction of the processing turnover. There is additional incentive if the enterprise is concerned with the mass production of a perishable, seasonal raw material, in which case volume must be secured during a limited period.

Because continuous operating is so generally associated with organization of enterprise for mass production, the managerial and social problems generated by mass production—especially those pertaining to merchandising, selling, production capacity, regularity of operations and of employment—are often inaccurately attributed to its technological tool, continuous operating. These are, however, economic problems, not technological problems of continuous operating per se. They may exist where there is not continuous operating and they do not necessarily exist where there is continuous operating. The managerial and social problems pertaining particularly to continuity of operation are, on the one hand, those concerned with the selection, training and supervision of workers, the coordination of shifts, the maintenance of quality and the establishment of quantity, quality, time and wage standards, where responsibility for product is divided among shifts; and, on the other hand, those pertaining to hours of work, the employment of women and children under the particular conditions and generally the effect on the individual, family life and social institutions of the reversal among the affected workers of the customary activities of day and night.

Because continuous industry applies its labor in a sequence of shifts, the central management problem to which most problems of detail are related, is that of making the shifts of labor and

of supervision equivalent. Efficiency is a compound of suitability of materials and of equipment, skill and attitude of workers and skill and attitude of supervision. Although the equipment and materials remain the same through a sequence of shifts, the skills and attitudes of workers and supervision usually vary. The assumption created by industrial and social customs is that the group working during the daylight hours is the normal one and that the others are abnormal. A better intelligence and skill in labor and supervision gravitate toward the day shift and are accompanied by a better emotional attitude toward goals and methods. Furthermore, studies of night work indicate that usually a worker produces less in a night than a day shift, although it is not yet clear whether this is because of inherent physiological and psychological factors or because the worker who labors at night yields to the temptation of activities during the day which preclude the securing of normal rest. Numerous variables are thus injected into the managerial situation, whereas the principal characteristic of the most advanced managerial technique is control of operations through a calculation and planning which employ constants as their factors. A peculiar task of management in continuous operating is avoidance of losses caused by these variables which may offset the economies of more complete utilization of plant and equipment. The principal method of achieving equivalence of shifts is by establishing conditions of night work fully equivalent to those of day work and by such a thoroughgoing establishment of standards of skill, materials, facilities, processes, methods, qualities and quantities as to permit measurements, specifications and comparisons of performance.

From the point of view of social welfare the principal problems of continuous industry relate to conditions of employment. It may be said that on the whole these have improved in recent years. Although not without conspicuous exceptions continuous industry requires such investments in plant and equipment that it is carried on by large enterprises which are receptive to enlightened policies concerning working conditions. Generally the two-shift system or the twelve-hour day has given place to the three-shift system of eight hours per day; women and minors have been eliminated from night shifts; and facilities, safety, heat, light, ventilation and other physical conditions have been improved throughout these industries. In some smaller

enterprises operating under extraordinary conditions, such as the canning industry, which is dependent upon seasonal, perishable raw materials and subject to a short season, the incentive to organize personnel hastily and temporarily and to secure volume output in a short time has caused notorious disregard for hours and conditions of work. In other larger enterprises, especially in newer industrial regions in which workers have not organized into unions and do not enjoy the benefit of collective pressure in securing improvements in working conditions and relations and in which an industrial conscience has not yet developed, there may be a lag in progress along these lines.

On the whole, the social problems pertaining to continuous industry are not essentially different from those pertaining to non-continuous industry except in two respects. These are, first, the lag noted above toward improvement in working conditions caused by inherent managerial difficulties, as in the change from one to another number of shifts in a twenty-four hour period; and, second, the disorganization of individual and social life resulting from night work by a considerable portion of a local population. Already there is evidence that social opinion is forcing improvement with respect to the first of these problems. With respect to the second, however, the direction of progress is not entirely clear. It is probable that night work will decrease in those industries in which it is not compelled by inherent technical conditions, for recognition of a problem of economic balance among industries as well as of the relatively lesser productivity of night work is causing the economic advantage of continuous operating to be questioned. On the other hand, it is conceivable that industry may discover how to organize night work more effectively and eliminate factors now unfavorable to workers and management, and society may decide that the social disutility of such work is less than the social advantage of shorter and shorter work periods made possible by working machinery continuously with the application of labor in short time shifts.

CONTINUOUS VOYAGE. The doctrine of continuous voyage in international law was originally developed by the British prize courts providing that where a direct voyage between two ports was illegal the fraudulent insertion of an intermediate port would not prevent the courts from regarding the two voyages as one continuous voyage. Although the doctrine was applied in the British prize courts to contraband as early as 1761 (the *Jesus*) and to blockade about 1804 (the *Vier gebroeders*), it was in its application to the colonial trade forbidden by Great Britain that the doctrine achieved its early growth. Under the Rule of the War of 1756 Great Britain declared it illegal for neutral merchants to engage in trade between France and French colonies, on the theory that a trade closed to them in time of peace might not legally be opened in time of war. The Americans thereupon evaded the rule by carrying merchandise from the French West Indies to the United States and thence to France in a second voyage. To defeat this indirect trade the British Prize Court adopted the doctrine of continuous voyage. They refused to concede that where a voyage was in fact continuous from a foreign colony to its mother country it was made two voyages by the fraudulent insertion of an intermediate port for the purpose of gaining thereby an apparently innocent port of departure. The leading cases in which the doctrine was applied under the rule of 1756 arose at the beginning of the nineteenth century. The American government protested without avail against the decisions, refusing to admit the illegality of such a

trade even where "confessedly continuous or direct."

The significant fact about the cases in which the doctrine had been applied to the colonial trade is that seizure always occurred on the second part of the voyage; thus the intent of the parties was evidenced by the overt act of continuing the original voyage. Necessarily different were the cases where the doctrine was applied to blockade or contraband. Here seizure of a neutral vessel or its cargo occurred during the first part of the voyage while the vessel was between two neutral ports. In the colonial trade both voyages, taken separately, were legal. In the application of the doctrine to blockade and contraband, however, the second half of the voyage would have been a direct violation of the belligerent rights of blockade or contraband. If seizure did not take place on the first part of the voyage it was unnecessary to invoke the doctrine of continuous voyage. But where seizure occurred in the first voyage international law required rigorous proof by the captor that there was an intention to continue the voyage of the vessel or cargo to an illegal destination.

The United States is usually charged with first applying the doctrine of continuous voyage to cases of blockade and contraband during the Civil War. But for all the Civil War cases, except those of the *Springbok* and the contraband on the *Peterhoff*, there are British precedents. Both seizure on the first part of the voyage and application of the doctrine of continuous voyage to cargo alone had been sanctioned in British prize courts, and the condemnation of the contraband on the *Peterhoff* (where the continued voyage was to be by land) had as precedent the case of the *Frau Houwina*, decided by the French in 1855. In the *Springbok* case, however, the court was altogether too willing to presume rather than to prove ultimate enemy destination of goods seized on a voyage between neutral ports.

At the London naval conference in 1908-09 the majority of the powers favored the application of the doctrine of continuous voyage to absolute contraband but not to conditional contraband or blockade. During the World War the doctrine was applied in all these classes of cases by both sides but principally by the British. Despite strong protests from the United States the British seized neutral American vessels proceeding to neutral countries and condemned them and their cargoes for having Germany as their ultimate destination. Instead of rigorous proof traditionally required in prize

courts the British courts presumed enemy destination and transferred the burden of proof from captor to captured. Although for some of the British decisions there were precedents, in other cases the doctrine was freely distorted. The United States ceased its protests upon its entry into the war, but the law as to continuous voyage probably remains where it was in 1914. Its extension may be regarded as inevitable under the existence of modern facilities of transportation and communication.

CONTRABAND OF WAR. The idea of contraband as applied to the seizure of articles which have a possible use in war and a belligerent destination appeared early, but the doctrine developed in modern times. Treaties prohibited furnishing war supplies to enemies of the parties as did the treaty of 1303 between England and France. An English example of a direct prohibition of trading is to be found in Edward III's action in 1315 when shipment of wheat or other provisions to the Scottish was interdicted. The use of the word contraband did not become common until much later. While the word contraband is employed in the treaty of Southampton of 1625 between England and Holland, even Grotius, writing at this time, does not use the word, although he classifies articles in times of war as (1) those things which have their sole use in war, such as arms; (2) those things which have no use in war, such as articles of luxury; (3) those things which have use both in war and peace, as money, provisions, ships and those things pertaining to ships (*De jure belli ac pacis*, bk. iii, ch. i, sect. 5). These categories were later called contraband, non-contraband and conditional contraband.

The law of contraband developed from the days of Grotius along with the law of neutrality and became established in the eighteenth century. From the time of the armed neutrality of 1780 there were continuous efforts to relieve innocent neutral commerce of risks in war, particularly after the introduction of steam transportation and other rapid means of communication. The Declaration of Paris in 1856 provided

that the neutral flag covered enemy's goods with the exception of contraband of war and that neutral goods with the exception of contraband of war were not liable to capture under the enemy's flag.

The United States had long advocated the entire abolition of the capture of private property at sea; Great Britain, although with few supporters, at the Second Hague Peace Conference in 1907 expressed a willingness "to abandon the principle of contraband of war altogether" (Great Britain, *Parliamentary Sessional Papers*, 1908, vol. cxvii, misc. no. 1, Cd. 3857, p. 16-17). Attempts to define the classes of contraband in more detail than is given in the general statements of Grotius had been made in many treaties and declarations. When such an attempt was made at the Second Hague Peace Conference it failed because of the impossibility of agreeing upon a satisfactory classification, but at the International Naval Conference of 1908-09 representatives of ten maritime states embodied lists of contraband in the Declaration of London. This declaration made articles of special use in war, such as arms and animals suitable for war use, absolute contraband. Articles *ancipitis usus*, "susceptible of use in war as well as for purposes of peace," such as food and fuel, were classed as conditional contraband. A list of articles not to be declared contraband was included, but it did not provide for the modern developments of means of warfare, mentioning such articles as raw cotton and rubber, and was therefore disregarded as impracticable in the World War.

In general, the number of articles listed as contraband has naturally been large when determined by belligerents and small when determined by neutrals. Often the lists have shown the influence of national conditions at the time. Russia in 1884 declared that coal was not contraband, but included coal in its absolute contraband list in the Russo-Japanese War of 1904-05. Great Britain protested against this action in the Russo-Japanese War. In 1915 Russia and Great Britain issued identic contraband lists designating fuel as conditional contraband. The Supreme Court of the United States in the case of the *Peterhoff* in 1866 said: "The classification of goods as contraband or not contraband has much perplexed text writers and jurists. A strictly accurate and satisfactory classification is perhaps impracticable" [72 U. S. 28, 58 (1866)]. "Historicus" (Sir W. Vernon Harcourt writing during the American Civil War observed: "In

order to constitute contraband of war, it is absolutely essential that two elements should concur—viz. a hostile quality and a hostile destination" (*Letters by Historicists on Some Questions of International Law*, London 1863, p. 191).

While there has been difference of opinion as to the character of articles regarded as contraband, there has also been much difference of opinion as to what constitutes hostile destination. Destination of goods is not always easy to discover, and reasonable doubt as to destination makes the vessel liable to seizure. Neutral destination is not always clear, even though goods are consigned to a person in a neutral port, and under the doctrine of continuous voyage (*q.v.*) the ultimate destination becomes the determining fact as to liability. Although it is a fundamental principle of the law of neutrality that neutral states in time of war must accommodate themselves to the changed relations of the belligerents and that belligerents must respect neutral rights, the natural tendency is for the belligerents to endeavor to extend their rights and for the neutrals to endeavor to prevent the extension. The belligerent aims to prevent contraband from reaching his opponent. The owner runs the risk of loss of contraband if it is captured. The carrier of contraband may lose his freight and suffer delay both in taking the vessel to the court and during the trial of the case. To avoid delay some treaties have provided for the delivery of contraband to the belligerent vessel of war making a visit, after which the carrier is permitted to proceed.

There has existed in some states the practise of determining liability of the vessel itself to condemnation for carriage of contraband by a rule which takes into account the ratio of contraband to the total cargo. This had not been a uniform ratio among states, but after 1909, when the unratified Declaration of London fixed it as one half "by value, by weight, by volume or by freight," this ratio became generally accepted [the *Hakan*, Appeal Cases, 148 (1918)]. Contraband may be seized on enemy, national or neutral vessels from the time the vessel leaves neutral territorial waters, and in case of fraudulent bills of lading or other fraudulent and irregular acts in connection with the carriage of the contraband the vessel itself may become liable even though the contraband it carries is less than 50 percent of its cargo. Notice should also be taken of the doctrine of preemption, in accordance with which goods useful in war, even though not contraband, may

be taken by a belligerent and paid for at a fair profit, usually reckoned at 10 percent above the market price at the port of destination.

During the World War there were many extensions of belligerent claims as to contraband. In 1914 Great Britain, France and Russia pronounced goods of the nature of contraband liable to capture even when bound for a neutral port if consigned "to order," to a consignee in an enemy's territory, or if the person to whom the consignment was made was not clear. The burden of proof of innocent destination was also shifted to the owner of the goods. Moreover, nearly everything was held to be of use in war. The British list of April 13, 1916, enumerated about one hundred and seventy groups of articles in alphabetical order from acetic acid and acetates to zinc, and there was a corresponding extension in claims as to what constituted destination. It was contended that if the goods bona fide consigned to and to be used by neutrals might be substituted for other goods which would be shipped to the enemy, the goods en route to the neutral were liable to condemnation under a doctrine of probable substitution. It was argued that "the more margarine was made for Sweden the more butter there was supplied by them to the Germans." It became evident that such a doctrine if carried to its extremes might prohibit all imports. Other devices were proposed or resorted to, such as letters of assurance by which an official at the port of departure certified as to the character of the cargo, but it was soon realized that a vessel might after its departure change the nature of its cargo. Such goods as could not be condemned as contraband were sometimes seized under the doctrine of preemption. In practise after the first few months of the World War the distinction between absolute and conditional contraband was not made. This was natural at a time when enemy governments were mobilizing all resources and population fit for military duty.

In all the changes in practise in regard to contraband some governments maintained that there were no changes in principle but merely an application of accepted principles to new conditions. The United States, however, in 1915, while a neutral, declared (Note, Secretary of State, March 30, 1915) that many of the acts of the belligerents relating to contraband were departures from rights "long clearly defined both in doctrine and in practise."

CONTRACT

LEGAL DOCTRINE AND HISTORY. Strictly contract denotes an act or set of acts creating obligation, i.e. creating a legal relation whereby one may exact some performance of another and the other is held to that performance or to a reparation for non-performance. But it is not uncommonly used also to denote the resulting obligation and even to denote the act and the relation thought of as one category. Using the term strictly, a contract is a legally enforceable promise or set of promises. This narrower meaning became current in the common law in the nineteenth century. Before that time two wider meanings had been given to the term. The more important is that of legal transaction (*Rechtsgeschäft*, *acte juridique*), namely, the declared will of a person or persons that some legal result shall follow, to which the law gives the intended effect. This is a nineteenth century generalization of the law of continental Europe, where it has served a very useful purpose in making it possible to work out general principles applicable to all types and varieties of transactions and thus to unify and simplify the law. Systematic legal thinking in the English speaking world has not yet made much use of this generalization. But in the eighteenth century the word contract was used in a broad sense to much the same effect, as, for instance, in the clause of the Constitution of the United States forbidding state legislation impairing the obligation of contracts. Sometimes also contract is used in a still broader sense to refer to all sources of legal liability arising from legal giving effect to reasonable expectations on the basis of promise or relations or situations, as distinguished from liability for wrongs or on the basis of claims to property.

Hence it is used to include all sources of duties of performance as distinguished from duties of reparation for wrongs or of restitution of possession or specific property. Legal transaction is a better term for the first of these broader meanings. The other gives us a mixed category of no logical validity and no practical utility. It has been used chiefly in philosophical discussions of the authority of legal and political institutions. In the present connection the stricter meaning is primarily dealt with. But it will be impossible wholly to exclude the broader meanings for reasons growing out of the history of law and of juristic and political thought.

A contract, then, is a legal transaction in which the declared will takes the form of a promise or set of promises; in which the intent to which the law gives effect is that one of the parties shall be bound to some performance - either by way of action or abstaining from action - which the other may exact, or that each of the parties shall be so bound toward the other. Where the performance is to be on one side only, the contract is said to be unilateral; where there are mutual promises, it is said to be bilateral. The elements are said to be (1) parties from whom and toward whom performance is due, (2) a declaration of will in such forms or under such circumstances as the law of the time and place may require and (3) an act or acts due to the one party and demandable legally by the other. The parties must have capacity for legal transactions, and the presuppositions of the transaction must not contravene the law or good morals.

Since the theory of a legal transaction was worked out in the last century, it has come to be thought that the terminology may require some modification, and the statement as to what the law does in giving effect to the transaction may perhaps call for no less. The term "will," which in the nineteenth century science of law was taken to denote a fundamental conception, is one with which the psychological science of law of today has a quarrel; and the proposition that the law gives effect to the intention of the parties is not only involved in that quarrel but had come to be in dispute already in the last quarter of the nineteenth century. A doctrine that it is not the actual intention but the declared intention which the law effectuates has gained ground and is now orthodox in Anglo-American law. But this doctrine was dictated by the necessities of enforce

ment. In developed law, so far as practical limitations on effective legal action permit, the purpose is to give effect to intention. In order to maintain the security of transactions the law has to establish objective tests of intention or to presuppose intention where the ordinary understanding of men would take it to exist. Except for the purposes of technical discussion the old way of putting the matter is more intelligible to the non-legal reader.

It has been said to be a jural postulate of civilized society that men must be able to assume that those with whom they deal in the general intercourse of the society will act in good faith, and as a corollary must be able to assume that those with whom they so deal will carry out their undertakings according to the expectations which the morality of the community attaches thereto. In a commercial and industrial society stability of promises as a social and economic institution becomes of the first importance, and this social interest in the security of transactions calls for securing the individual interest of the promisee; that is, his claim to be assured in the expectation created, which has become part of his substance. The law has never responded wholly and indeed legal machinery cannot respond wholly to the demands of this postulate. At most legal enforcement affords an additional assurance that engagements will be kept. Indeed, because in its beginnings law seeks only to cover a narrow field of social control, law and morality have no necessary correspondence in the period of the strict law. Hence there is a reciprocal effect of customary reliance on legal enforcement and of legal enforcement on customary reliance. If the law sets out to give effect to the customary expectations of men, yet, as law and morality tend to diverge under the strict law, men learn not to rely or not to rely much on what the law will not enforce. In a later state of legal development there is a persistent endeavor to bring law and morality and even law and an ideal of morals into accord. It is in this stage that the law of contracts has its real development. In the world of today, in a credit economy, promises are so much the normal course of dealing that reliance on them goes without saying. In consequence the present day attitude is that any bargain should be enforceable unless there are reasons to the contrary. But Anglo-American legal materials took shape in a different economic order and developed under a feeling that bargains were only to be legally

enforceable when reason could be shown for enforcement.

Security of transactions may be maintained through religion or through the internal discipline of a kin group or an organization in its image (primitive secret society, *collegium*) or through the pressure of opinion of an interest group, as in the custom of merchants in the Middle Ages. It may be maintained by an ingrained traditional morality such as the Roman *boni mores* and *prisca fides*, so that the clasp of hands is a sufficient guaranty of performance of business transactions. But as a specialized system of adjustment of relations and valuing and harmonizing of interests by politically organized society becomes the paramount agency of social control, legal securing of promised advantages comes to bear the brunt of external upholding of the economic order. No doubt it is easy for the lawyer to exaggerate the importance of this role of the law of contracts. In recent times increased stress upon the social interest in the individual life leads to a tendency to impose risks of non-fulfilment upon the creditor. A debtor may escape with the full sanction of the law through bankruptcy or statutory exemptions from execution and may find his legal liability mitigated in the civil law by a *beneficium competentiae* (insuring him means of maintaining himself beyond reach of creditors) or its analogues, or under statutes in the English speaking world allowing payment of judgments in instalments. Also many things which are understood in the ethics of business are not recognized, much less enforced by the law—e.g. cancellation of accepted orders. Frequently it is not possible for legal machinery to assure a full performance such as the obligation calls for. But with all allowance, legal enforcement of promises so far as it goes and so far as it may go is the ultimate reliance of the developed economic order.

Contract in the broader sense is significant also as a means of self-regulation as distinguished from governmental regulation. Certain things the law definitely refuses to effectuate or even strives to prevent. Beyond this it leaves men's affairs to self-regulation, achieved for the most part by agreement. In the latter field the law furthers the economic order by providing models or standards which may be employed but need not be; which will be assumed in the absence of agreement to the contrary and yet will yield to modification or alteration by agreement. By entering into a standardized relation

or by conforming to the pattern of some legal conception, the parties may make a whole series of legal rules and doctrines available without giving any consideration to details yet may if they choose modify or qualify or reject almost any of those details. These conceptions in practise provide convenient standardized transactions without compelling conformity to them. Thus the power of effective self-assertion in a competitive economic order is furthered and at the same time the everyday operations of business are facilitated by the possibility of adopting the standardized transactions and thus finding the details of transactions and relations already worked out. This function of providing a framework for relations and for group organization is increasingly important in an era of cooperative economic activity.

Historical jurists are wont to use the term law to include the whole of social control. Hence to them the furthering of the security of transactions by religion, kin discipline and traditional morality is not part of the pre-history of the law of contract but is not to be differentiated from the law. But the development and present condition of the law of contract can be better understood if the term law is taken in the sense of the analytical jurists, i.e. to mean social control through the systematic application of the force of politically organized society. Limiting the term thus, in the beginning law has to do only with a small part of the area of social control. Most of the relations of life are dealt with by the discipline of the kin group, by religion or by *boni mores*. For a long time the law is concerned chiefly with keeping the peace and hence with homicides, assaults, dispossessions and succession to property. Thus a Greek thinker of the fifth century B.C. laid down that there were but three subjects of lawsuits, namely, insult, injury and homicide. The law begins by ignoring the securing of promised advantages, not because men think it of no consequence but because promises are in the field of other agencies of social control. There is, however, another reason for the relatively slow development of legal securing of promised advantages. In the beginnings of law modes of establishing facts are necessarily crude. The peace which the law strives to maintain would be endangered by an attempt to try issues of fact rationally at a time when "a good stick is a good argument." Mechanical modes of trial are characteristic of early law and so law at first and for a long time thereafter

calls for forms of transaction which admit of simple decisive establishment of the fact and import of the promise. The legally recognized transactions are few and rigidly standardized. The apparent exception in Greek law is attributable to the undifferentiated ethical custom and law (in the analytical sense) by which justice was administered in the Greek city-state. Rational trials were highly developed at Athens. But while Greek thought affected the subsequent philosophical treatment of legal enforcement of promises, the materials upon which that thought was employed were furnished by Roman law.

Thus the first forms of recognized promises are symbolic, such as the handclasp recognized by *boni mores* at Rome, or taken over from religion, as a calling of the gods to witness or a libation or in the Middle Ages a promissory oath; or if they are legal in origin they simulate a real transaction, i.e. one creating property rights (for example, gift, exchange, pledge) although intended to create obligation.

In Roman law and in English law the earliest type of enforceable promise is the formal contract in which the form or ceremony is not merely an evidence of the transaction but is the very transaction itself. In the Roman law the formal contracts were an oath (*jus jurandum*), a ceremony of question and answer using the sacramental word *spondeo*, implying a libation, and a ceremony with bronze coin and balance in the presence of witnesses, the precise nature of which is in dispute, but which at any rate was in form a real transaction. Another type was the literal contract in which obligation was created by entries upon the household books of account. To these were added later real contracts in which the ground of enforcement was found not in the form but in the delivery of something by the one party to the other, with respect to which the obligation arose. These real contracts were loan for consumption (with a liability to return an equivalent quantity and quality), loan for use, gratuitous deposit for safe keeping, and pledge. In the last three there was liability to do what good faith demanded in such a connection and hence to return or account for the thing delivered and to take proper care of it. Also these duties of good faith were reciprocal so that, for example, a lender or depositor for safe keeping or pledgor who delivered something in a defective or dangerous condition without notice and so caused loss to the other party could be held therefor. These

two are standardized transactions, but less rigidly so and with more detailed consequences worked out and attached to the obligation or resulting relation. To these were added four consensual contracts, i.e. transactions in which the ground of enforcement was said to be found in the mere consent of the parties. Such were buying and selling, letting and hiring, mandate (gratuitous undertaking to execute a commission for another) and partnership. The first two, however, were juristic workings over of what had been done originally by means of formal transactions.

Except for the four consensual contracts, agreement or promise of itself carried with it no legal enforceability. A mere pact was not enforceable. Yet it was recognized as involving a moral duty and hence might operate indirectly as creating a "natural obligation," so that, for example, it could be the basis of an equitable defense. Also the idea of enforcing promises grew continually under the empire. Thus there came to be an increasing number of actionable pacts, of which the most important are the so-called innominate contracts, i.e. pacts in which performance on one side turns the transaction into a legally enforceable contract. In the maturity of the law under the late empire the forms which had not become obsolete became much relaxed. The written evidence of a formal contract became itself a contract. The category of actionable pacts became greatly extended. Thus in practice, if not in legal theory, substantially all deliberate promises and business bargains became legally enforceable. But down to the end the Roman law was governed doctrinally by the idea of requiring a legal reason for enforcing promises, by a juristic presupposition that enforcement was something exceptional for which a reason must always be given. The maxim embodied in the *Digest*—*ex nudo pacto non oritur actio*, an action does not arise from mere agreement—has affected legal thinking ever since.

A like story may be told of the history of contract in the common law. Here too it begins with formal contracts or specialties—the written acknowledgment of indebtedness, sealed and delivered (bond) or the formal promise to do or not to do something made in a sealed instrument (covenant) or the solemn acknowledgment of indebtedness upon a condition, made in court and put on the record (recognizance). Another old category is warranties, i.e. express promissory representations incidental to other

transactions. These were sued on upon the theory that the breach was a wrong but came also to be thought of analytically from the standpoint of contract and may be sued on either *ex delicto* or *ex contractu*. Another category is bailments, transactions in which the obligation results from delivery of something from one to another, with duties enforceable at first on a theory of wrongs but coming to be dealt with either *ex delicto* or *ex contractu* as incidents of the relation. Still another is what have been called mercantile specialties, formal contracts of the law merchant—bills of exchange and promissory notes, in which, as in all formal contracts, the writing is more than evidence of the transaction and is the very transaction itself. Hence if the instrument is accidentally destroyed or lost, no action is possible and a suit in equity must be resorted to in order to restore it. Still another category is debt, in which there is a duty of paying a liquidated sum of money or originally of turning over a specific thing due to the one party and detained by the other. Where the debt was not evidenced by a sealed instrument, the debtor by the old law could "wage his law," i.e. free himself of an action on the debt by his oath and that of his oath helpers. Hence with the progress of the law debts arising otherwise than upon specialty came to be enforced by an action in form *ex delicto* for the wrong in not performing a promise said to be implied by the law from the ground of indebtedness. Simple contracts, i.e. those not in the category of specialty or of bailment, also came to be enforced by an action in form *ex delicto*, i.e. an action for the wrong in not performing a promise exchanged for an act or for another promise. Thus by the nineteenth century the area of enforceable promises had been greatly extended. In the latter part of the eighteenth century, indeed, Lord Mansfield sought to establish and came very near establishing a doctrine that no promise in writing and no business promise should be *nudum pactum*. But a reaction set in and it was not until the present century that a new tendency to extend the sphere of legally enforceable promises became manifest in English speaking jurisdictions. Such an extension is obviously going on today through exceptions to the requirement of consideration, stretchings of the idea of consideration, and interpretations of transaction so as to bring them within recognized categories.

In early law status or position before the law was the significant institution. In modern

law as the human being, the moral unit, becomes the legal unit, and such legal disabilities and incapacities as remain are attached to natural conditions rather than to legal position, the regime of self-determination by legally recognized agreements becomes the significant feature of the legal ordering of society. Thus the idea of contract appeals to thinkers on law and on politics. In the philosophy of law after the sixteenth century there is found increasing endeavor to explain the institutions and doctrines and precepts of the law on every hand in terms of contract, i.e. of legal transaction. Likewise with the disappearance of the relationally organized society of the Middle Ages and the rise of a society organized about competitive acquisitive activity law ceased to appear something imposed traditionally or authoritatively from without. Instead of existing from a natural necessity, as the Greek philosopher had put it, government and law seemed to exist by human institution. Since political self-determination was extending along with the extension of the area of legally recognized agreement, the idea of contract appealed to political thinkers also. It had been resorted to earlier in the course of contests between temporal rulers and the popes. But it became a staple of legal and political philosophy in the seventeenth and eighteenth centuries. During the whole period of dominance of the conception of "natural law" jurists sought to find a philosophical basis of law and of the state in a postulated legal transaction. Some parts of the law, notably the law of public utilities, suffered long from the attempt to make the idea of contract (in the sense of legal transaction) do the whole work of systematic doctrinal development. Attempts were made to work out the duties and liabilities of a public utility in terms of a legal transaction of professing a public calling, to treat the relation of utility and patron in terms of legal transactions on the analogy of the law of bailments and to conceive of an offer by a would be passenger who signals a bus driver to stop and an acceptance by the carrier when the bus stops accordingly. Such things are perhaps the last echoes of the contract jurisprudence which reigned a century ago.

Because of the preponderant role of contract in modern law and the reliance upon the analogy of a legal transaction in classical political thinking, jurists and philosophers of law have busied themselves much with the theory of enforcing promises. Their theories have practical im-

portance because, although their speculations have been influenced by the state of the law, they have also affected the shaping of the legal materials by juristic writing and judicial decision. In the seventeenth and eighteenth centuries it was argued that a promise as such had an inherent moral force, demonstrable by reason, and that this inherent force was the basis of legal recognition and enforcement. With the breakdown of the eighteenth century natural law jurisprudence, following the critical philosophy of Kant, metaphysical theories governed in the nineteenth century. Enforcement of a legal transaction was taken to be a giving effect to the will and thus a recognition of personality. The will having been declared, the law gave effect to it and thus enabled the free willing individual to realize his will in the external world. Accordingly in the last century a will jurisprudence succeeded to the contract jurisprudence of the two preceding centuries. Contract was explained in terms of will and the idea of liability as a result of free exertion of the will was sought to be carried out to its logical consequences in every field of the law. This will jurisprudence, through its doctrine of an abstract freedom of contract as a corollary of free will, had unfortunate consequences in the attitude of American courts toward social legislation for a generation after 1886, when the first statutes prohibiting payment of wages in orders on company stores came before the courts. In fact the common law never gave effect to promises on the basis of the subjective will of the promisor. It is true that courts of equity, inheriting modes of thought from a time when the chancellor "searched the conscience" of a defendant by an examination under oath, have assumed they had subjective data beyond the reach of a court of law. No one can doubt, however, as he reads the Anglo-American law reports, that despite strenuous attempts on behalf of the will theory on the part of nineteenth century text writers the objective theory of legal transactions prevails in the common law. It has been gaining in the civil law world for a generation. It is now orthodox to rest the enforcement of promises upon an idea of giving effect to the expectations created by the conduct of the promisor in order to maintain the security of transactions in an economic order resting on credit.

In the civil or modern Roman law, the influence of the enforcement of pacts by the church courts on the basis of the moral obligation

and of the natural law conception of the inherent moral force of a promise and identification of legal with moral obligations led to thinking not of the need of showing a reason for the enforcing of a promise but of the need of showing a reason for making it. The reason for or presupposition of making it was a reason for enforcing it. With the coming of the will theory, will to be bound was a reason for making a promise and so a reason for enforcing it. Accordingly the French law made intention of gratuitously benefiting another a ground of enforcement and the Austrian code of 1811 presumed a sufficient ground, requiring the promisor, if he would escape, to prove that there was no intention to enter into a binding undertaking. Except for some requirements of proof in order to obviate fraud, the modern law of continental Europe asks only whether the promisor intended to create a binding duty. Also the machinery of enforcement in the civil law world is modern and adequate. In the Roman law seizure of the person and holding him in bondage to coerce satisfaction from him or his kinsmen was succeeded by a pecuniary condemnation enforced in the classical law by what might be called involuntary bankruptcy. Specific relief was had through a clumsy device of decreeing performance on the alternative of a heavy money condemnation. In the law of today there is an action to require performance with 'natural execution,' i.e. a doing by the court or its officers, at the promisor's expense, of the things he is bound to do as ascertained by the judgment. Money relief is given if for some reason specific relief is impracticable or inequitable. Also transfer of the promisee's claim to exact a performance is fully and freely permitted except where the nature of the promise is such that it would alter in character if performed to another than the promisee. Promises to one for the benefit of another have given more difficulty. Legal logic has insisted that the relation whereby one could exact and the other was bound to performance was between promisor and promisee only. The Roman law did not allow an action by the third party beneficiary and the French civil code of 1804 followed the Roman law. But recent codes have made liberal provisions for this matter and the French law has found a way out by treating such promises not as technical contracts, governed by the code pronouncement, but as a special type of legal transaction to be given effect on the general doctrine of effectuating the declared will.

Performance of promises is not secured so completely or effectively in common law jurisdictions. The common law does not yet recognize all intentional promises, intended to be binding on the promisor, as legally enforceable. In general a gratuitous promise will be enforced only if under seal. Many American jurisdictions have abolished private seals and others have given them only the effect of creating a presumption of consideration, with no provision for anything to take their place. The Conference of Commissioners on Uniform State Laws has sought to remedy this situation by proposing a statute whereby a written declaration of intent to be legally bound shall suffice. In the case of simple contracts, for historical reasons, technical rules as to consideration stand in the way of complete securing of all deliberate promises. An enforceable promise must be part of a bargain. It must have been made in exchange for an act to which the promisee was not bound or in exchange for a promise. In the old Germanic law obligation was created by the symbolic giving of something to the promisor in return for the promise, thus creating the appearance of an exchange. From this *causa debendi*, or ground of owing performance, a theory of equivalents was worked out. Promises were enforceable where the promisor had received an equivalent therefor. This fitted well the common law conception of debt. In the sixteenth and seventeenth centuries the continental theories of reason for making as reason for enforcement influenced common law thinking. But most of all the requirement of consideration, i.e. of an act or promise exchanged for the promise to be enforced, was due to the exigencies of procedure. It was necessary to enforce simple contracts by an action in form *ex delicto*, and some detriment to the promisee was called for in order to satisfy the requirements of an action of trespass on the case. Thus a combination of procedural requirements, historical modes of thought and philosophical reasoning produced a doctrine which hardened in the nineteenth century. In the present century it has been giving way at many points under the pressure of a general feeling that business promises should be enforceable and promises deliberately made should be recognized in law as in the ordinary understanding of men.

In the old law only the promisee could enforce the promise. Transfer of promisee's claim was not permitted. Also the third party beneficiary had no standing in court. But a power of

the assignee to sue in the name of the assigner was recognized and equity protected this power. Today by legislation assignment of contract rights is fully recognized, and most American courts have in one way or another allowed the third party beneficiary to sue upon the promise for his benefit so far as this can be done consistently with due protection of the parties. But American modes of enforcement are not so satisfactory. The common law remedy upon contract is an action for damages, since the simple contract, which has become the model for all contracts, was enforced by an action for the wrong of breaking it. This is regarded as the normal remedy. Specific relief is given exceptionally in equity where pecuniary relief is "inadequate." Thus in the great majority of cases the promisee cannot compel performance in specie but must be content with the money value of performance. Nor has "natural execution" developed, as in the civil law, although legislation long ago allowed something like it in the one case of a decree for conveyance of land and the federal equity rules of 1913 have given it some further scope. Also the English courts now grant "mandatory injunctions" somewhat freely.

As the civil law has been at its best in the law of contracts and has treated torts on a contract theory, the common law has been at its best in the law of torts and has treated contracts on a tort theory.

ROSCOE POUND

INSTITUTIONAL ASPECTS. *Origins.* Contract is an ambiguous term. It is used especially to indicate (1) business agreements in fact as such (irrespective of their legal consequences and irrespective of whether they have any such consequences); (2) agreements in fact with legal consequences (which is broad enough to include barter and outright conveyance; so Ely's use); and (3) the legal effects, if any, of promises (Corbin) - including the various incidents which "adhere" to major promises of particular kinds. This last, stricter concept is most useful for the law and is here adopted. Discrimination among these ideas is needed; no discussion of the meaning of contract in society can be confined to a single one of the concepts. For the law of contract begins in the notion that legal officials should enforce or at least draw into reckoning certain of men's bargains or promises (or, primitively, even those non-refusable "gifts" which impose obligation to reciprocate).

The law draws life throughout from such a notion. On the other hand, the shaping of agreements in fact depends to some extent on the type and extent of enforceability currently available at law. The beginning is in a society in which bargains and promises are rare; reliance on them merely as such is therefore unusual, unreasonable, an individual risk of the relator. Reliance on promises is itself in good part a function of usage; even more so is that perceived reasonableness of reliance which sets the first basis for official intervention. In such conditions the legal stand is that there shall be no enforcement until specific particular reason is shown. And it may have been the obviousness of such particular reason when disputes were publicly compromised which led to the early importance in law of that type of agreement. But the present stage of the development lies in a credit economy in which bargains and promises are so much the normal course of dealing that reliance on them is a matter of course; the legal approach (certain rules of procedure, e.g. on burden of showing consideration, to the contrary notwithstanding) is fundamentally that any bargain or promise is enforceable unless reason appears to the contrary.

The officials of primitive law limited their aid in enforcement to particular types of transaction recognizable by their strictly formal or formulaic character. The one form may be used for accomplishing results (e.g. promise or conveyance) which modern eyes would view as wholly diverse transaction types. Official aid on the contract side consists most commonly in an official declaration that an obligation is owed and forfeit and that the creditor is acting properly when he seizes the debtor or the debtor's assets. It may never be possible to establish whether in such cases the official sets the form and law controls practice or whether lay practice sets the form for law to sanction. Probably there was interaction with customary practice initially in the foreground, later in the background. The problem seems clearly to have been the determination of when that unusual thing, the holding of a man to a promise, was to occur; and it is essential to remember also that law in its beginning is almost undifferentiated from other forms of social pressure. Formal acts are then the manner of signifying openly a definitive intent to change the existing situation. Whether there is a ceremonial handclasp or copper or scales or a magical ceremony like the establishment of blood

brotherhood or the solemn invocation of supernatural sanction by oath or promise before official witnesses (*cf.* the acceptance of engagement ring, pledge button, or king's shilling or other earnest money) an overt sign of intent to assume obligation is present; the consequence to be expected is both recognition by law officials and—at least as soon as this has occurred—a strong tendency thereafter to limit the number of recognized forms which will move either officials to act or laymen to feel justified in reliance on the promise.

Yet to the extent that the economy changes the ritual forms theretofore established must prove inadequate both to cover engagements in fact and to protect reliance in fact. Legal obligation then diverges from non-legal obligation. This means that legal obligation ceases to function merely as an extra insurance that engagements will be performed. It functions also as a source of risk. If one party appeals to law, then (to the extent that the obligation is viewed differently by layman and lawman) the other party will either get less or be held to more than fair customary understanding calls for. Such divergence between law and lay obligation is a constant tendency as soon as legal technique becomes specialized. It is frequently present in commercial cases in American courts today (*see* ARBITRATION, COMMERCIAL). As the law of contracts thus constantly gets out of date and overformal it offers the cautious and canny layman an advantage over his unschooled adversary. This in turn sets up the constant countertendency: the subjection of law to reformatory pressure from the newer uses and understandings in the world of dealings or from perception of those abuses which arise out of the manipulation of legal technique.

Behind and beside the law, early or developed, there works not only the fact thus far chiefly discussed of credit or trust but also the opposite fact of distrust, of self-help. If oath or promise is the type of the first, forfeit and hostage are the type of the second. For all that we can see, the second roots as early and as deep; and it still continues. So in the modern use of conditions on promises, as when the continuance of life insurance is set free of any promise by the insured to pay and is instead merely conditioned upon regular payment of the premiums. So in the use of security devices from the pawn to the corporate blanket mortgage. There is indeed little question that both

law and form of early contract take origin as much or more in the giving of a forfeit as in the making of an unambiguous engagement (the word itself derives from the incurring of obligation by giving a "gage"). Often the two merge. The writer dares to doubt, however, the too ready assumption by German legal historians that at the outset the picture is regularly one of a *Schuld*, or obligation, perceived as such, accompanied by a somewhat inadequately adjusted *Haftung*, or enforcement, machinery. To him it seems that in a non-credit economy it must have been at least equally prevalent to regard the forfeit as mere pressure: not "you must do what you have promised, on pain of forfeit," but "you have given up a thing which you can get back only by doing a stated thing." This at the outset involves no necessary concept of duty. But the idea of duty will develop in due course quite as well from anticipated unpleasant consequences of non-accomplishment (for instance, in religious propitiation) as from a sense of what action is by custom to be expected in the circumstances: courts still currently speak of burdensome conditions as duties. However this may be, in system after system the primitive forfeit has been refined slowly into a security device and the notion that the real and primary center of attention is the obligation to be performed has worked its way into law. The process recurs even in modern law, as in the modern German chattel mortgage. And in American instalment contracts for chattels from about 1860 to date each of the primitive features is repeated, only to yield slowly to better insight: the conception that the risk is on the creditor, as the "owner" of the chattel; the conception that failure to pay on time wholly forfeits the security, with no provision either for foreclosure or for accounting for any excess in value over debt; the conception that resorting to the security destroys any right upon the debt (this last is a refinement; in the primitive forfeit there was no right upon a "debt").

General Importance. It is trite that, viewing a status organized society as a whole, bargain is a tool of change and of growing individual self-determination and that this holds increasingly as bargains come to cover the future and as in that aspect they become enforceable if the other party breaks faith. It is hardly less trite that the self-determination aspect varies not only with the number of bargains in fact available to a particular bar-

gainer but with the degree to which their phases can be individualized to his desires or, as the case may be, can be subdivided into specialized bargains to meet his needs. The power to shift one's status a single time (becoming a priest) or even often (marriage and divorce) gets one but a short bit along the road "from status to contract." *Per contra*, to the extent that available bargains both increase their scope (for example, closed shop *v.* yellow dog or open shop *v.* company town) and become standardized for whole groups and tend to become exclusively available, a regime of contract moves a long step toward status, group building and stabilization of social relations. Equality of bargaining power has in this aspect been rightly stressed as of greater importance than the "liberty of contract" of legal—especially of constitutional law—theory. But the flexibility of the factually available bargains needs no less stress.

Bargain is then the social and legal machinery appropriate to arranging affairs in any specialized economy which relies on exchange rather than tradition (the manor) or authority (the army) for apportionment of productive energy and of product. Contract in the strict sense is the specifically legal machinery appropriate when such an economy moves into the phase of credit dealings, i.e. of future dealings in general—in which aspect the mutual reliance of two dealers on their respective promises comes of course into major importance. This machinery of contract applies in general to the market for land, goods, services, credit or any combination of these. All this, however, begs the question of why there need be any legal machinery at all for the purposes mentioned, other than mere protection of the factual results of accomplished bargains, work, deliveries and payments. The peace, and more dubiously the law of alienability and that of ownership, at least as against persons entrusted with possession—what more is needed? It is vital to recall, as one puts such a question, how seldom law touches directly any case in which a promise has been performed or in which an inadequate performance has been received in satisfaction. Promise, performance and adjustment are in this sense primarily extralegal. It needs no argument that if they did not normally occur without law's intervention no regime of future dealings would be possible. The lawyer's idea of contract, applied to these normal cases, where performance and informal business ad-

justment proceed to occur is thus a conceptual projection of trouble and the legal spawn of trouble upon the untroubled in fact. The lawyer's idea applied to such cases is unreal in genesis and misleading in implication unless (which is the matter of inquiry) what the courts may do in the possible case of trouble is a needed factor, or at least one factor, in promise or in performance or in adjustment.

Neither will it do to treat the mere presence of legal machinery in any particular field as of itself demonstrating a need for it there. Such presence may merely present an instance of unneeded or even of parasitic expansion of a going institution. Law early serves a prime function in offering means of dealing with some types of dispute not otherwise adjusted. Along with this goes a recurrent tendency for law to set itself up as the exclusive means for dealing with any dispute, if it be appealed to. Law regularly purports to speak for the group as a whole, which means a pressure to draw into its orbit any other important institution; it is the other institutions which offer the stuff of disputes.

Finally, rarely until modern times has expansion of jurisdiction been unprofitable to the lawmen concerned. The chief countertendency to this expansion is found in law's own formalism, and in the traditionalized character of the molds within which lawmen must move if their action is to have standing as official. Given then promises present, relied on and broken, law will sooner or later wrestle with their breach, whether or not the society peculiarly requires such wrestling.

Yet as the specialization and credit, and particularly the industrial, aspects of an economy gain ground, it becomes hard to escape the case for utility of legal enforcement of promises. Credit or reliance on a purely customary or self-interest basis presupposes for effectiveness either permanence of dealings involving long run mutual dependence or an ingrained traditional morality covering the point or dealings within a face to face community (or its equivalent, a close knit wandering guildlike interest group such as the early mediaeval merchants seem to have been) in which severe group pressure on delinquent promisors is available. These types of sanction fail in a society mobile as to institutions, mobile as to residence, mobile as to occupation; they fail increasingly as the market expands spatially and in complexity. They fail, in a word, as

to long run, long range, impersonal bargains, as also in cases where death or transfer of rights removes from the relation what was originally a personal aspect.

Whatever the need for legal enforcement of contract in current dealings then, its place in an investment structure is obvious. It is essential to any approach to a market for capital, to any machinery for mobilizing funds or diversifying investments. Equally essential with contract itself is the transferability—that is to say, the depersonalization—of contract rights. The older view of privity as essential to legal action on a contract was connected partly with semimagical aspects of legal form; partly with a conception of contract as an essentially peculiar, unusual thing; partly with a conception that contractual transactions had no proper importance for non-participants. None of these conceptions fits an investment market; it is significant that the first free transferability (that of bills of exchange) developed among merchants apart from law proper. It is further significant that merchants found no trouble with the concept of suit by a third party beneficiary—which still gives trouble to some courts—and that they shaved the freely transferable contract right down to certain standardized essentials. In business essence, although not so strictly in law, a very similar standardizing and simplifying process occurs in the investment market today; the investor looks for six or seven particular familiar features in a stock or bond, irrespective of the length of the mortgage indenture or articles of incorporation—features familiar enough to be summed up conveniently in Poor or Moody. For business purposes too a distinction in kind between bonds and stocks tends definitely to disappear. Both are conceived and in much the same way as obligations of a corporation; both, as property; both, as giving legal rights which are important. Frequently enough only the legal sanction for the promise exists. Where other sanctions do exist (for instance, desire for continued dealings or for a business reputation) they show an unfortunate tendency to fail precisely where most needed, i.e. when stress of loss (or gain, as in the case of management manipulation of the market or merger of the debtor) is strong. Max Weber cogently remarks that ethics founded on expediency are less reliable factors in performance than are those founded in tradition. As a result, even to some extent in short run face to face dealings and a fortiori and importantly in

long run ones, legal enforceability figures as an element of added security in credit matters; a partial insurance against the very case of need when credit judgment was misguided or in case of death or assignment or where supervening troubles disrupt either willingness or power to perform.

It has been mentioned that this legal insurance is commonly accompanied by an element of legal risk. What the law official will enforce is what he sees as the legal obligation. An agreement that to a business man calls for shipment of goods as close as conveniently possible to those described, with (as of course) price adjustment for defective deliveries and return and replacement of unusable articles, means to a court that the seller is to comply with the description precisely or have no rights at all. What a buyer will regret not obtaining on a rising market he can then reject with impunity if the market falls; yet this very risk of the market is one which the deal was intended to shift to him. So also agreements to renew indebtedness relied on as of course by business men are commonly unenforceable at law; while business understandings very commonly permit wide cancellations of what to the court are flatly enforceable contracts to buy. It is true that "business understanding" of what an agreement means and indeed of whether an agreement exists is by no means unambiguous and not always adjustable. It is not alone wilful default but honest difference of opinion which leads to disputes and which leaves some proper room for law officials. Both ways and norms of business practises are firm at the center but lazy at the edge; they offer little sure guide in dealing with the unusual case. Yet it should be emphasized in this connection that when the law official takes hold he is as likely as not to begin with a wholly non-customary reading of the obligation.

Indeed, if the commercial and legal understandings of whether and what performance is due should coincide, the legal security of the obligee shows holes. A contract is no equivalent of performance. Holmes long ago noted that in the pinch the measure of what it means is its meaning to the evil minded person. It is known but often glossed over that the contract as such gives rights only against the promisor in general, enforceable out of his general assets; in the event of the obligor's bankruptcy the right is reduced to ratable sharing with other general creditors. There are illegitimate but

effective devices for concealing assets. There are startling statistics on the extent and the small uses of dividends in failures. The remedy at law then, good in the one case of need—wilful breach—becomes dubious in the other case of need—economic distress or dishonest bankruptcy. The results leave it dark as to how far legal enforceability is really a factor in the initial making of future commitments and the giving of short term credit and even more as to how far such influence as it may exert on either may be regarded as healthy. Severe limits of the influence of much of commercial law in a sufficiently prosperous economy are suggested, for example, by the development and the substantial persistence until 1910 in New York of as maladjusted a complex of rules on sales of goods as our law has known. In a few cases, such as the letter of credit litigation in the decade following 1920, the inference is indeed unmistakable that the law has strengthened the credit instrument and given it further soundness. Yet the example is inconclusive; it is picked from a field of peculiarly long range and indirect contact, where peculiar financial security is expressly bargained for. None the less, it is certain that legal enforceability is a heavy factor in the handling of items once gone bad; sometimes it is a factor in inducing performance by a debtor; a salvage factor it always is, although on bad risks, which it may itself have contributed to begetting.

It is at this point that the law of contract again makes contact with the law of security. From an economic angle bargaining for security is an intensified case of the security provided by legal enforceability alone. It looks to cover in part the exact risks mere contract rights leave open. The secured creditor obtains beyond his general claim a right to satisfaction out of specified assets of the debtor; he obtains moreover a right which can be partially protected against fraud. The primitive form of security (pawn) requires transfer of possession to the creditor; the more developed forms (e.g. mortgage, pledge of bills of lading) can transfer rights without disturbing the physical things concerned. But it should be noted that sociologically and wholly irrespective of legal doctrine (for example, to the effect that property rights in specific things have been transferred) the law of security here merges with the law of contract: rights realizable only at a future time and unaccompanied by present enjoyment are own brothers of contract; their enforcement

in case of delinquency is likely too to require legal process. The same holds of important portions of the law of trusts and of relationships generally which are affected by agreement (agency, bailment and, as has been indicated above, corporation) whether or not associated with phases of property. Nevertheless, the idea of security being a property matter is firmly enough ingrained in our legal system to have far reaching results and to force lawyers who are seeking security to keep the specific and present character of the assets subjectable in the forefront of their minds. Similarly, the mere contract creditor must reckon with the possible elimination from the general estate of an insolvent of all its vital assets by way of security to others. This would be too obvious for mention if it did not again raise the question of how far mere enforceability of contract at law plays a part in current future deals.

Irrespective of that question it is clear that current future deals themselves in their effect on the arrangement of economic affairs lie halfway between mere reliance on the general spot market for either supplies or outlet and propertywise assurance of either by vertical integration. On the side of services the situation is quite similar but more complex. Between "own unit" organization (property, plus an ownership and management set up framed in good part on contract and plus exclusive control of "agents" under a contract set up and of a standing force of labor) and the rather uncommon mere reliance on the general spot market (calling in the plumber or the doctor) lie a short range letting out of individual jobs (roofing a house) and a standing relation letting out of particular services (insurance coverage, deposit account, legal or advertising counsel). Perhaps the same can be said as to the supply of and outlet for working funds; yet when one is again tempted to assume legal contract or even factual promises as an utterly essential feature in present day American economy one is forced to remember that much of current financing proceeds on flexible and revocable understandings as to line and conditions of credit. Indeed, such flexibility is a marked trend in marketing of goods as well, wherever long range buyer-seller relations come to seem more important than exact definition of the risks to be shifted by the particular dicker in terms of quantity, quality or price: output and requirement contracts, maximum and minimum contracts, contracts with quality

quantity and kinds to be specified from month to month and sliding scale price arrangements are symptomatic of an economy stabilizing itself along new lines.

The importance of contract law is not, however, to be found wholly in the field of economic life. Much of the growth of law itself is surely traceable to contract (or rather, bargain). Originally and at present arbitration of differences is by agreement; out of a practise of arbitration originally and at present official tribunals grow. Our jury trial of fact disputes was introduced by the same process, although under vigorous urging by the crown's officers. There is too the importance of "the social contract" as a concept in political theory and political life. And quite apart from arbitration as a preliminary stage in international or industrial government there is the importance of treaties as a major base of international law and of group bargain as a basis of industrial relations. The former bears obvious close relation to the technical law of contract because interpretation relies so peculiarly on private law analogy. The latter carries into another sphere—not that of legal contract theory but that of social and political effects of contract (bargain) and especially of contract as an instrument of unofficial government.

First, unofficial self-government. Official government, despite modern ramifications, reaches patently but a minor fraction of the affairs of men in society. And on the side of law it expressly leaves most of what remains open to self-regulation—in good part by agreement. It is convenient to refer to the clean cut distinction taken in European theory between iron rules of public policy (as, in American law, that there must be consideration or a seal to make an agreement enforceable; or that agreements running counter to the criminal law are unenforceable) and the "yielding" rules which hold if, but only if, there is no expression to the contrary. These latter rules Isaacs has well described as themselves forming an official standardized contract on each matter (sale, corporation, partnership, etc.) subject to alteration by the parties. They result in a curious and useful combination of status and contract values; status, in that a full set of obligation incidents are available for adoption (without thought) by any persons entering the relation; contract, in that entrance is voluntary and particular modification is possible. The field not thus covered in advance by settled rules yet

open to the parties' regulation must be added. One thus finds available for self-government a number of contract or relation patterns well worked out; certain conditions and limitations on the use of each of them, leaving each, however, highly flexible; and, finally, along with a certain tendency to regard the basic accepted patterns as exclusively covering the whole field (e.g. the question so frequently raised: is this "a sale" or "an agency"?—*cf.* also the Roman nominate contracts) a countertendency to enforce many novel types of bargain more or less as made. Yet Ehrlich has soundly argued that legal contract is in these situations but a part of the picture. As is contract to government, so is mere agreement to contract; so also, usage plus initiative and acquiescence to mere agreement. In the self-government of subgroups contract (agreement) provides an original framework, a constitution, a source of ultimate sanction in dispute or breakdown. Further factual agreement from time to time, informed by usage and that running combination of initiative and passivity which does not even call for conscious agreeing, fills the framework with living content and often so stretches or overlays it as to make the initial contract a wholly misleading picture of what occurs. Law and practise of corporations, factories, trade unions, churches and households thus differ as do law and practise of the constitution.

Where the self-governmental bargain is driven between parties who are consciously in partial opposition (labor and employer; insured and insurer; as contrasted with formation of a family corporation or perhaps a cooperative) the legal aspects of the bargain take on peculiar importance. Trouble is in the offing. Law is more likely to be called upon. At the very least, appeal to the group constitution is more likely. Where bargaining power and legal skill and experience as well are concentrated on one side of the type transaction, resort to law is even more probable. Standardized contracts in and of themselves partake of the general nature of machine production. They materially ease and cheapen selling and distribution. They are easy to make, file, check and fill. To a regime of fungible goods is added one of fungible transactions—fungible not merely by virtue of simplicity (the sale of a loaf of bread over the counter) but despite complexity. Dealings with fungible transactions are cheaper, easier. One interpretation of a doubtful point in court or out of court gives clear light on a thousand

further transactions. Finally, from the angle of the individual enterprise, they make the experience and planning power of the high executive available to cheaper help and also available without waiting through a painful training period.

Where skill and power enter on one side only, however, the situation changes. Law, under the drafting skill of counsel, now turns out a form of contract which resolves all questions in advance in favor of the one party. It is a form of contract which in the measure of the importance of the particular deal in the other party's life amounts to the exercise of unofficial government of some by others, via private law. (Compare the progressive lopsidedness as one moves, for example, from auto purchase and residence or oil lease through the auto distributor's agreement to factory employment in general and finally to employment in a company town or on a sugar beet farm.) The problem has pressed toward relief, but the courts have been slow to see what was needed or to invent the remedy. Beneath the surface of the opinions the observer feels a persistent doubt as to the wisdom of any interference with men's bargains; he feels especially a timidity as to admitting any power to interfere, when no ready means appears of setting definite and wise limits to the interference. Hence interference appears chiefly case by case and almost wholly by way of construing the particular language in question not to have intended the result it did intend (see also *infra*, *re* mutuality). Life insurance is a classic instance. This procedure saves the lesser bargainor for the moment but leaves the greater a steady succession of new chances to redraft and fight again; and for him a single victory is likely to be permanent. Legislative intervention, prohibiting certain clauses and prescribing others, may remedy this, if it survives; but it comes under attack along similar lines for unconstitutionality; its sin lies in not construing, but in prescribing (see FREEDOM OF CONTRACT; DUE PROCESS OF LAW). Where admitted it offers the great value (for example, in insurance and labor cases) of being limited to definite matters in which regulation is shown by experience to be needed; a result less easy of accomplishment under the common law. Competition (life insurance, oil leases) may contribute toward readjustment of the bargain on more balanced lines; in general, however, the tendency when standardized contracts are used seems to be

rather, even in highly competitive fields (installment sales, investments, customer's collateral note), to borrow and accumulate seller protective instead of customer protective clauses; a fortiori, when, as in the labor field, competitive pressure on the contract drafter weakens. At this point the official's attempts to wrestle with the social implications of agreements (in first instance, by twisting their meaning; in second, by refusing official aid to an "illegal" agreement; in third, by legislative fiat, chiefly by way of visiting penalties upon the making of the prescribed agreement) cross into the broader field of the use of the law to enforce tabus on particular types of conduct. The widest laissez faire has some limits in the criminal law, and courts commonly refuse to enforce a promise looking toward commission of a crime. But courts have also refused enforcement of agreements which seemed to tend contrary to well channeled public policies, for example, to support a mistress, to induce another to break a contract, to restrain trade unreasonably, to make a mortgage non-redeemable or to give up claims against a carrier for his possible future negligence. It is interesting to observe in these cases how many of such rulings verge back into the equilibrating of the bargain made.

In the more clearly vital field of lopsided standardized agreements it is obvious but needs constant emphasis that the life meaning of the legal set up is affected seriously by factors other than the remedies directly available at law. An insurer, although discharged at law, may reinstate the policy or may even pay, as a matter of business policy. A landlord or banker may never resort to his ironclad document save when for extraneous reasons it proves impossible to work with the other party. Meticulous insistence on every detail of a construction or even merchandising contract can almost be guaranteed to force the contractor into default. The problem is therefore seldom one of a practise of tyranny (contrast the loan shark). It is rather a problem of legal power which makes tyranny possible at arbitrary will—a significant instance being the dispossession of the customary tenants by the highland Scottish clan heads as legal owners. On the other hand, the legal remedy directly available may not even suggest the extent of the legal power which derives from an ideology of contract in a given situation. The impairment of contracts clause of the American constitution and the liberty of

contract conception protect from governmental interference not only existing contractual advantages but mere expectations thereof and protect them equally in cases such as agreements with wage earners where the direct legal remedy may be illusory; so also (as for example against attempts at organization of a shop) with the injunction against "inducing breach," which has in some courts carried over even into such cases of employment at will as would not in themselves be admitted by any lawyer to constitute contract at all.

To sum up, the major importance of legal contract is to provide a framework for well nigh every type of group organization and every type of passing or permanent relation between individuals and groups up to and including states—a framework highly adjustable, a framework which almost never accurately indicates real working relations, but which affords a rough indication around which such relations vary, an occasional guide in cases of doubt and a norm of ultimate appeal when the relations cease in fact to work. The trend toward standardization, despite its values where power is balanced, raises doubts as to policy where its effects are lopsided, because the norm of ultimate appeal is then so tremendously deflected to the one side. The direct legal sanctions are not the major measure of importance. Their effect as a threat is uncertain. In the credit field they break down in the case of greatest need, unless strengthened by security. And indirect sanctions—at least in the case of "inducing breach"—may lie close to the heart of the protection sought.

Some Technical Phases in Action. Primitive contract law, whether because economic ideas are undeveloped or because legal machinery is clumsy, is affected strongly by elements of vengeance, presupposing the *Schuld* idea, and of high forfeit, which need not presuppose it. Seizing the debtor's body (even, very early, killing him); debt slavery; penalties and forfeitures—these have persisted into modern times. With the prohibition of peonage, the abolition of imprisonment for debt and the refusal of courts to enforce penalties, although agreed upon—buttressed by usury legislation and limitations on assignment of wages and future property—modern law moves definitely on to the basis of reparation for breach as the main purpose of legal remedy. Specific reparation—which presupposes that the defendant has the wherewithal to perform—has in Anglo-

American law been limited largely to the case of land and has been worked out on the theory that damages are inadequate because of the peculiar nature of the thing contracted for. In the case of the irreplaceable personal services a compromise with the peonage prohibition is sought by enjoining against competitive employment. The normal remedy for (i.e. the normal legal meaning of) breach is damages; it has, unfortunately, been so overrigidified in many cases—especially on the assumption of a frictionless market—as to make the remedy inadequate. The law in Germany and legal practise in England, allowing the plaintiff to go on the market and cover, offer a fairly adequate adjustment; but in any event there will be a delay in reparation for which legal interest is no adequate compensation to a business man. Even apart from insolvency, therefore, the legal remedy appears as essentially a device in the last resort, adequate only to assure the promisor that he will by breach gain only as to delay. The heavy drive toward actual performance must therefore be found outside the law; although the law, for example, by way of an ideology of "duty," contributes to such outside drives.

This view is reinforced by the customary performance in fact of legally nugatory or unenforceable promises. In no legal system are all promises enforceable; common sense sets limits. In all the effort is to find definite marks at once to cover those which should be enforceable and to signify those which are. On the latter side, particular traditional forms and rules continue effective even when they fail to serve the former purpose. The Anglo-American effective form was once, and still is in many states, a sealed writing (covenant, indenture). The purpose was, at a time when few could write, to authenticate the making of a promise with intent to be obligated. Similar authentication and effect was had by acknowledgment in court (recognizance) or in continental Europe by having the promise recorded by a notary—there an important official. Promises legally effective through form, being typically of archaic origin, are typically accompanied by archaic effects, long since grown arbitrary. Some of these have persisted in the United States with the sealed instrument even where the primary effect of the seal itself has been abolished by statute.

But a commercial economy calls for the enforcement of less formal promises. So the

Romans admitted suits on book accounts, and the Greeks developed suits on written promises (*synallagma*). Modern continental law admits a suit on any promise with proper *causa*—very roughly meaning any sufficient justification in policy for recognition by the court. Our own requirement is the much discussed consideration—which in its modern development is definitely approaching a similar meaning, “any sufficient justification in policy,” but the exact effects of which still continue to be seriously influenced by a number of overrigid rules.

The roots of the consideration requirement seem to lie, on the one hand, in the development of the informal contract action (*assumpsit*) out of tort; a promise, relied on and performance of which was begun (“misfeasance,” not “mere” non-feasance) but badly done or discontinued to the detriment of the promisee. On the other hand, the action was brought into play as a substitute for debt, in which, by a curious degeneration of the Germanic system of awarding proof to the apparently sounder side, the defendant had acquired as of right the power to swear himself out of judgment; debt lay, when an agreed equivalent had actually been received by the defendant. The consideration requirement thus comes in time to be formulated as a benefit to the promisor (an echo of debt) or a detriment to the promisee (the tort root) which is the agreed equivalent and inducing cause of the promise to be enforced. The formulation covers most cases but not all. Indeed, it is obvious that the great bulk of business promises fit in perfectly, as soon as the arbitrary but utterly necessary logical jump is made of making mutual promises serve as consideration for each other. Four troublesome classes of cases remain: business promises like “firm offers,” understood to be good for a fixed time but revoked before; related to which are, second, those promises which call for acceptance by extended action (laying twenty miles of track) but which are revoked while the work is in process. A third and important class is that of additional or modifying business promises made after an original deal has been agreed upon. The fourth is found chiefly within the family: a promise really made and reasonably relied on but which did not bargain for such reliance as an equivalent. A distinct but very uneven tendency to strain toward enforcement in the last three classes is observable in the courts. The first still goes largely untouched.

When one attempts to estimate the net value of the consideration requirement, the first step is to repeat that it does fit most normal cases in life, that it gives trouble only on the fringes. As a test of what promises not to enforce it must be regarded as somewhat formalistic. The existence of bargain equivalency does indeed commonly evidence positively that the promise was deliberate—considered meant. Such equivalency gives also fair ground for believing that some promise was in fact made and thereby much reduces the danger from possible perjury. The giving of a bargain equivalent, be it by promise or by action, is furthermore an excellent objective indication not only of the creation of expectation in the promisee but of the reasonableness of such expectation and of its being related to the promise. Yet it will be observed that the handing over of a signed promise in writing (which is not enough for enforcement) would go far in most circumstances to assure the same values; no lawyer, for example, can fail to be struck by the closeness with which exemptions from the requirement of writing under the statute of frauds are related to the presence of unambiguous consideration, which is substantially equivalent in fact to the promise claimed. Nor is it apparent why in many cases deliberateness, due assurance that the promise was made, relied on, and properly so, might not all be evidenced by circumstances apart from either writing or consideration. The problem is acute only within the family; in business a writing might well be made a condition to the reasonableness of any reliance. All in all, as a test for non-enforcement the consideration requirement must be regarded as not yet wholly just to modern needs.

As a positive test, a test for what promises to enforce, the same must be said. For here the requirement of the positive law runs in terms not of factual equivalency but of formal equivalency under the bargain as stated. A consideration which in fact is largely even wholly formal may be enough (release of injury claim for a dollar). This is well enough when the promise is one whose enforcement is in itself socially desirable: a charitable subscription, a promise to provide for a child on marriage, an option to buy land. And it is enforcement in such cases which has given foothold for the draftsman in cases of a socially different character. But the recognition of formal consideration in general language obscures the problem discussed

above, as to government by contract; the problem so clearly seen by the courts in usury and mortgage cases and by the legislature in regulation of employment contracts: that of semi-duress in fact. It is therefore not surprising that recent years have seen in business cases the incursion into the doctrine of consideration of a further doctrine of so-called "mutuality" (at law) whereby particular promises were matched off against each other, and some equivalency in fact (e.g. to buy, if the other party has agreed to sell) frequently insisted on, even when formally adequate consideration was present. It is to be expected that this tendency will continue, and it is not unlikely that it will develop as in the past peculiarly to relieve the weaker bargainer. The lopsidedness of bargain result is thus taken as the mark of lopsidedness of bargain making. But the motivation being apparently not wholly conscious, the result has been (as so often during case law growth) confusion in doctrine and uncertainty in outcome; and—what is natural enough in a business economy—it has also resulted in a relief of smaller business men which can find little counterpart in the case of the laborer.

Closely related to the values and presuppositions of the consideration doctrine (especially equivalency) is of course the development of the doctrine of implied conditions, under which the performance promised by the one party is made to condition the duty of the other to continue; and under which, occasionally, peculiar unforeseen events destroying either equivalency or the presuppositions of the deal may result in discharge of the contract. Closely related too are doctrines—developed especially in equity and transferred to the stricter law—giving a promisor exemption (or redress or restitution) when his promise is induced by duress, fraud, misrepresentation or even some types of mistake. That similar doctrines are found in systems ignorant of consideration shows only that the latter is a device seeking in enforcement of promises the same social values which other systems seek to find by other means.

But just as no system of promise enforcement can do its work without taking account of the fact that existence of forms commonly sufficient to enforcement may be produced by illicit means, so no system may ignore the value of forms as records and vouchers of a deal having actually been made or their importance as

permanent and reckonable evidence of what was agreed. Contracts are transactions, not mere events, and as deliberate transactions are capable of prophylactic regulation; since they are transactions relied upon, men have an interest in predictable security as to their legal effects. Hence for a variety of transactions, notably unperformed contracts to sell goods or land, and guaranties, the statute of frauds (*q.v.*) requires for enforceability a memorandum of the essential terms, signed by the borrower. By 1676—the date of the original statute—literacy was perhaps to be expected in England of the classes concerned in such transactions; but certainly not so throughout American history. Yet the modern developments of business large units requiring internal written records if files are to be kept straight, officers informed, departments coordinated and the work of shifting personnel kept track of; the spread of literacy; the practise of confirming oral deals in writing; the use of forms—all these confirm the policy of the statute, all these reduce the price in disappointments exacted for its benefits. The chief difficulty lies now in the very common informal verbal understandings modifying performance under a writing once made—a problem as yet inadequately solved. On the other hand, the parol evidence rule (in Wignore's incisive phrasing the "rule of integration") comes in to limit the enforceable agreement to what is incorporated in a writing, if an apparently complete writing is once made. Especially this rule is said to eliminate any prior or contemporaneous modifying terms. As to agreements drawn under advice of counsel, the wisdom of this is obvious; and the policy fits equally with that great bulk of agreements which are made wholly by correspondence. But in other cases—as with informal verbal modifications under the statute of frauds—the court is faced by the counterpolicy of recognizing the frequency with which vital terms of oral negotiations are in fact omitted from (or not reduced to) a formal writing. The course of actual decision has, in consequence, no approach to the predictability the rule is supposed to achieve; a point which can hardly be too strongly stressed. Yet the net effects of the two rules together, as they work into lay practise, are almost certainly wholesome not only in encouraging permanent and trustworthy record of agreements but also in inducing care in the making of the record.

In the unsystematic American law contract occupies a unique position. It is the one field in which a grand scale orderly synthesis has been attempted and with fair success achieved. And this has been lauded as the great legal accomplishment of the past century in the common law. To the modern Romanist the achievement appears partial; he sees our very object of synthesis as itself but one element in the still grander scheme of transactions. To a few American scholars this seems no reproach; they doubt the wisdom of generalizations in our law on anything like the scale attempted by a single systematization of all contract and challenge the applicability of many of the current generalizations to various important bodies of cases. This view is needed, if one is to understand the many developments, such as the emergence of a requirement of mutuality in certain contracts, discussed above. On the other hand, the vitality of the generalizing tendency may be noted not only in the scholarly work of the last seventy years, culminating in the restatement of the law of contracts, but also in the decisions themselves. So, for example, in the extensive submergence in the field of sales of the old time peculiar notions of warranty in the general concepts of promise and condition. So also in the stiffening of many courts, in the teeth of the pressure of the facts, against allowing an action when the accepted formulae as to consideration remain unsatisfied. In ultimate outcome the general theory of contract will probably come to assert a less absolute dominion over the entire field and be content to recognize considerable local self-government where that is demanded by particular fact situations. As a body of doctrine available and pressing for constant application and development wherever no compelling reason to the contrary appears, no man can doubt its high utility; the chief criticism to be made is that the field of synthesis has been artificially limited to the scope of the old assumptit action. Meantime it pays to note that here as always doctrinal synthesis tends to distort the picture of the underlying reality. For doctrinal synthesis finds its heavy focus of attention in marginal and even pathological cases. Thus the replacement of a will theory (as on the continent) or "meeting of the minds" theory (as in American law) of contract formation by a theory of objective manifestations—apparently indicating promise—and reasonably relied on by the other party: this is a great advance. It emphasizes also,

and properly, the high importance of reasonable expectation in contract (and indeed in life and law generally). Yet the very advance has obscured the sociological vitality of the older insight; if in all but amazing cases manifestation did not roughly coincide with intent, we should have no law of contract to make an "objective reliance" theory of peculiar cases necessary.

CONTRACT CLAUSE. No important provision of the federal constitution received less attention from the Convention of 1787 or from

the state ratifying conventions than did the contract clause, which reads: "No state shall . . . pass any . . . law impairing the obligation of contracts" (U. S. Const. art. 1 sect. 10). It was not included in either of the plans presented to the convention but seems to have been put in by the committee on style, probably by Gouverneur Morris, and was adopted without debate. The probabilities are that it was designed by its framers primarily for the protection of private contracts and that it was prompted by the unwholesome practise on the part of state legislatures during the period of the Confederation of passing laws disturbing the binding force of business agreements. Depreciated paper money was made legal tender; debtors were permitted to pay in instalments, in kind or after a period of delay; and various ingenious devices were employed to embarrass creditors in the securing of legal redress. The members of the convention knew these abuses well and were determined to establish a system of government which would correct them. The contract clause was primarily directed to this end.

It is not impossible, however, that the clause was also intended to protect contracts made with the state itself. Such a purpose fits logically into the philosophy of the social compact which dominated the political thinking of the day and which abhorred a breach of a public contract as a violation of natural right. There is also evidence that James Wilson, who probably shared the responsibility for including the contract clause, had had unpleasant experiences with the Pennsylvania legislature, which had some years before wantonly destroyed the charter rights of the College of Philadelphia and later of the Bank of North America, in both of which he was interested. That he had in mind the application of the contract clause as a protection to corporate charters granted by the states seems not out of the question (Fisher, S. G., *The Evolution of the Constitution of the United States*, Philadelphia 1897, p. 262 et seq.).

The judicial interpretation of the contract clause began with a series of cases which involved contracts made by the state. The first was that of *Fletcher v. Peck* [10 U. S. 87 (1810)] holding that a legislative grant of land made upon good consideration must be deemed an executed contract beyond the reach of any subsequent legislative annulment. The grant had been made by the legislature of Georgia under circumstances of flagrant fraud and bribery, but the land had passed into the hands of innocent

purchasers and the grant was held protected by the contract clause. Two years later, in *New Jersey State v. Wilson* [11 U. S. 164 (1812)], a statutory exemption from taxation, supported by consideration, was held to be a contract which the legislature could not impair.

In the famous *Dartmouth College Case* [Trustees of Dartmouth College v. Woodward, 17 U. S. 518 (1819)] a corporate charter was held to be a contract within the meaning of the contract clause. Accordingly the charter which the college had received from the English crown in 1769 was beyond the reach of legislative rescission or impairment. The importance of this decision upon the development of our economic and industrial life can hardly be exaggerated, for it guaranteed to those who invested their capital under the corporate form of organization complete protection against subsequent legislative interference with the rights, privileges or obligations contained in the corporate charter. An element of security and stability was thus added to the economic life of the nation at a time when it was vastly needed, and the concept of vested interests was placed upon a secure foundation. The public, however, was exposed to some danger that the legislatures might enter into corrupt or improvident charter contracts which would then be irrevocable. The contract theory of corporate charters undoubtedly resulted in the unwise but permanent grant of many charters grossly contrary to the public interest.

The term contract thus came to be interpreted broadly as including all classes of contracts, public as well as private. The clause was held to cover contracts between states and individuals in the form of ordinary business agreements, grants, exemptions from taxation, charters of incorporation and franchises issued to businesses affected with a public interest. It also was applied to all contracts among the states, between a state or states and the federal government and to contracts made by cities or counties as agents of the states.

The question of what constituted the "obligation of a contract" came up for consideration in the case of *Sturges v. Crowninshield* [17 U. S. 122 (1819)], in which a New York bankruptcy law was held to impair debts existing at the time of its passage. Chief Justice Marshall maintained in the opinion on that case that the obligation of a contract was to be determined exclusively in terms of the agreement between the parties. The obligation of a contract of debt was therefore simply the obligation of the debtor to pay the

creditor at the specified time, and this obligation could not be impaired either by subsequent or by prior legislation. Consequently Marshall believed that state bankruptcy acts were invalid even as to debts contracted after their passage. The Supreme Court, however, in *Ogden v. Saunders* [25 U. S. 213 (1827)] established over his dissent the rule that the obligation of a contract consists not merely in the terms of the agreement between the parties but includes also the relevant law in force at the time the contract is made. The contract clause therefore forbids only laws which operate retroactively upon contracts. Accordingly not only were state bankruptcy laws valid as applied to debts made after their enactment, but, more important still, state legislatures could enact general laws reserving the power to amend corporate charters and other long continuing contracts. Of course, such power must be exercised within the limits of due process of law.

In the case of *Charles River Bridge v. Warren Bridge* [36 U. S. 420 (1837)] the court held that the charter of a corporation must be strictly construed and that any doubt as to whether the public has parted with rights or privileges in granting the charter or franchise must be resolved against the grant. Thus a charter to operate a toll bridge was held not to be impaired by a later legislative act chartering another bridge a short distance away which was soon to be a free bridge. The element of monopoly could not be read into the first charter by implication since it was not specifically included. This rule of strict interpretation has prevented the improvident enlargement of corporate powers by implication and loose construction.

While the courts have sought with considerable strictness to give effect to the central economic purpose of the contract clause they have at the same time recognized certain limitations upon its uniform application. These limitations arise for the most part from those powers of government which are of such paramount public importance that the state is held powerless to bargain them away by contract. Most important of these is the state's police power. No contract, charter, franchise, grant or other bargain which the state may make can stand in the way of subsequent valid exercise of the police power. Thus a corporate charter authorizing the operation of a lottery was held not protected by the contract clause against a subsequent prohibition of all lotteries [see *Stone v. Mississippi*, 101 U. S. 814 (1879)]. While tax exemptions

given upon good consideration are protected by the contract clause, it seems clear that the state could not contract away its whole power of taxation. Nor may it contract away its power of eminent domain, its power to destroy or regulate public offices or control salaries, its power over the public waters of the state, its power to make general governmental regulations or its ordinary power of legislation. Such legislation, for example, may change the means or manner of enforcing contracts so long as it leaves a substantial and adequate remedy. But exemption laws and other laws restricting the field from which the creditor may collect have been generally held to impair the obligation of existing contracts. The contract clause cannot be invoked by private creditors to whom the state fails to make payment on a contract, since the obligation is impaired not by the passing of any law but by the failure to pass a law appropriating the necessary funds. In addition to this legal doctrine there is, of course, the provision of the Eleventh Amendment which prevents a citizen from suing a state in a federal court.

The clause by its very words limits only the states and is not in any sense a restriction upon the federal government. Congress may pass laws which impair the obligation of contracts and has done so in a very few cases, notably in those of the federal legal tender and soldiers' moratorium laws. Unless such a federal law violates due process or some other specific limitation on federal power it cannot be attacked.

The contract clause has accorded needed constitutional protection against legislative invasion of contract rights and has thus served as a bulwark to private property and vested interests. But its influence has been more far reaching. By its continued emphasis upon the importance and necessity of keeping faith in our public and private obligations it has aided in establishing in business and governmental relations the principles of honesty and reliability. It has helped to build up a sound tradition which serves to protect contract rights by preventing the enactment of impairing legislation even more than by invalidating such legislation when enacted.

CONTRACT, FREEDOM OF. See **FREEDOM OF CONTRACT.**

CONTRACT LABOR is a by-product of the international immobility of labor. The higher standards of living made possible by the development of new countries and of modern production methods have drawn masses of people from poorer and more "backward" regions. Yet inertia, ignorance and the cost of transportation tend to offset the lure of the new lands; and the migrations, great as they have been, have nevertheless often taken place more slowly than seemed profitable to employers who wished to make use of cheaper and more abundant labor. A number of expedients have therefore been employed to hasten and to organize this movement of population. Of these the most common method has been the slave trade, and various devices of "forced labor" still accomplish somewhat similar movements of workers within particular colonies. The sending out of convict labor was a temporary expedient in the Australian and American settlements. The more common method in the American case, that of using indentured labor under formal contract to serve for a term of years to work out the cost of passage, has often been employed in more modern times. It is this system that carried Pacific islanders to the sugar fields of Queensland, that supplied the kingdom of Hawaii with laborers from both the Portuguese islands and Japan and that has taken coolies from India to the West Indies and to the plantations of Fiji. Its chief use has been in the Chinese "coolie trade," which between 1847 and 1874 transported between a quarter and a half million workers to Cuba, Peru, Chile and Hawaii and which in later years—under more careful regulations—has sent many more to British Guiana, British and Dutch Malaysia, to the mines of South Africa and to the war zone of France. In some cases indentured labor has meant the slave

trade thinly disguised, as in the "blackbirding" of the Kanakas and in the early practices in the Chinese trade. In others, and particularly under British, Dutch and Hawaiian control, the contracts have been strictly supervised and the laborers have often found genuine opportunities in the new land at the end of their service. But in each of these cases the legal basis has been the formal indenture under which the laborer is held for a considerable term of years to the specific performance of the work for which he is imported.

These methods are no longer of importance in "advanced" countries within the temperate zones, yet even to these lands there has been a great volume of induced as well as spontaneous immigration. This has been true both in the case of migration for permanent settlement and also for such seasonal movements as those which bring agricultural workers into France and Germany for the harvest season and which even carry laborers back and forth each year from Italy to the Argentine. Sometimes the stimulus has been merely the salesmanship of transportation companies. In the case of France it has been the government which has maintained a special recruiting service in the countries from which laborers have come; and for Australia and New Zealand the most important special inducement has been government assistance in paying the cost of passage. But in many instances, and particularly in that of the United States, the chief activity has been that of private employers or their direct agents, who have advanced ticket money on the understanding that the immigrants would work for them on their arrival in the new country. This last practice is "what is commonly but," says Professor Commons, "inaccurately called 'contract labor.'" Certainly the term is inaccurate if it is thought of as implying any such strict enforceability as in the case of formal indentures. The employer could not enforce specific performance by an unwilling laborer, and the latter's property or wages would offer little prospect of substantial damages. On the other hand, the alien himself would hardly be able to make effective use of the legal machinery of a strange country in maintaining his rights against a defaulting employer. Such "contracts," however, have often given real advantages to both parties and have no doubt commonly been carried out. To the emigrant they seem to offer both passage money and the assurance of a job. To the employer they seem to offer a supply of selected workers likely to

serve contentedly at rates below those prevailing in the high wage country. For precisely this reason the system has been vigorously opposed by organized labor, and most countries of extensive immigration have attempted to consider the interests of their own workers in framing regulations on the subject of contract labor. In South Africa, to be sure, the showing of a satisfactory contract of employment is taken as the best proof that the immigrant will not be a public charge and therefore should be admitted. On the other hand, Canada prohibits the importation of contract labor except on terms previously approved by the authorities, Cuba prohibits except in special cases similarly passed on, and Australia adds the further proviso that the immigrants shall not be brought in as strike breakers. The regulations in France rest upon special labor conventions and treaties concluded with Italy, Poland and Czechoslovakia, the chief countries from which its foreign labor comes, and provide that every immigrant contract must be made upon standard forms specifying conditions of employment in great detail and attempting to embody the principle of equal pay and equal treatment with French workers "of the same class."

It is in the United States, however, that the greatest controversy has arisen and the most drastic steps have been taken. The system in its modern form arose toward the close of the Civil War with the organization of the American Emigrant Company as "an efficient channel of intercourse between the man in America who wants help and the man in England who wants work." An act of 1864 encouraged this intercourse by permitting the immigrant's wages to be pledged for a year for the fulfillment of the contract, but this provision was repealed in 1868. Importation of contract labor, however, continued on a large scale, bringing many thousands of laborers to mines and factories and construction jobs, tapping the first flow of the "new" immigration and in one famous case importing nine thousand Chinese coolies to hasten the completion of the Pacific railroads. Native labor was bitterly opposed to these developments; and in 1885 the unions, led by the then powerful Knights of Labor, secured the passage of the Alien Contract Labor Law forbidding the importation of workers under contract. Amendments in 1887 and 1888 provided for the debarment and deportation of alien contractees, and an act of 1891 prohibited all forms of solicitation of immigrants. Court deci-

sions defined contracts so narrowly as to make their existence very difficult to establish and limited the scope of the regulations to unskilled manual labor; but in 1907 Congress increased their effectiveness by specifically including skilled manual labor and by adding "offers and promises of employment" to the original "contracts or agreements." These provisions are substantially those of the present law. Domestic servants and skilled workmen of types needed for new industries and unobtainable in the United States have from the first been exempted, although exceptions under this second clause now require prior approval by the secretary of labor. Administrative regulations during the war shortage of labor set aside temporarily both the contract and literacy barriers in the case of the importation of Mexican laborers, and an attempt on the part of employing interests in the border states to revive this exemption led as far as hearings before a House committee in 1920. But there has been no alteration of the general policy that contract labor should be rigidly excluded, and on every border the incoming alien "eager to escape the Scylla of a public charge exclusion" must be equally careful not to "run into the Charybdis of the contract labor law."

The immigration authorities have made vigorous efforts to enforce the law both by inspection at the ports and by investigation in industrial centers. More than forty thousand aliens were debarred on these grounds in the period from 1892 to 1929, and over sixteen hundred contract laborers were found and deported between 1906 and 1929. Prosecution of contracting companies has been a more difficult matter, but since 1907 the government has in a number of cases collected substantial fines. Yet report after report of the commissioner general of immigration has complained of the great difficulties of enforcement even of the amended law, and there can be no doubt that violations of its spirit have continued on a large scale.

Particular difficulties of enforcement, as well as the most flagrant abuses, have existed in the case of the padrone system, through which the immigrant comes in under agreement not with an American company but with a contractor of his own race. At first the padrone (Italian, boss) was merely labor agent and interpreter for the employer; but as the system developed these agents became principals, themselves controlled the labor of the immigrants and either farmed them out to employers or used them in enter-

ries of their own. The practise seems to have begun with Italian labor on railroad construction and other unskilled work; among the Syrians it took the form of the exploitation of peddlers under direct control of the padrones; and still later it spread to the races from the Balkan peninsula and to Mexicans in the southwest. The system was peculiarly likely to lead to personal oppression through many forms of exploitation due to the control over the immigrant by the padrone, as, for instance, when the padrone also acted as boarding house keeper and banker. It reached perhaps its worst point in the widespread employment of young Greek bootblacks, under contracts often secured by mortgages on the family's land in the old country, in conditions of virtual slavery. In each case, however, the padrone system has tended to decline as the race becomes more firmly established in America, and together with other forms of contract labor it has become much less important with the reduction in the volume of immigration.

Under the present quota restrictions contract labor has ceased to be an acute issue, and it is now possible to see that the agitation against it was merely an early form of the general movement toward restriction rather than a movement raising major questions of its own. The chief importance of the system both to the employers who made use of it and to the unions that fought it was its effect in increasing the migration of low standard workers. The real menace of their competition, from the labor point of view, lay not in the fact that they came to a particular employer but in the fact that they came to the country at all. The contract, to be sure, often brought them directly to the scene of a strike; but their effect in lowering wages could hardly have been less had they been dumped upon the American labor market without knowing where to go. Nor would employers have taken the trouble and expense of importation had equally large supplies of tractable labor been brought to the country in other ways. The issue, then, appears to lose the unique importance sometimes attributed to it. As long as workers are to be admitted in large numbers into countries of very different standards it will no doubt be necessary to restrain employers and others from taking undue advantage of their ignorance. This may be accomplished as well by the Australian supervision of contracts as by the American attempt to prohibit them altogether, and perhaps even more effectively by placing immigrants under

the protection of government employment exchanges. In any case regulation of contract labor strikes only at the terms under which workers of lower standards are to be introduced; the more substantial questions are those of the rate and amount of importation.

CONTROL, SOCIAL. In its wider sense the term social control describes any influence exerted by society upon the individual. In its narrower sense, as currently used by certain economists, it has come to mean the consciously planned guidance of economic processes. The two types of control are found in varying combinations in all our social activities, and since the one term is used for both, they are easily and frequently confused. But a clear distinction must be made between those situations in which control by a group is unconscious and involuntary and those in which a group explicitly uses and directs individuals toward the realization of its own purposes. Although custom and convention, for instance, are powerful in conditioning the thought and conduct of man, society

does not exercise through them the same kind of control as it does through education or the movement toward the abolition of war. Customs are, however, continually being changed by the introduction of purposive activity on the part of some group. Indeed, as communities become more civilized, there is an attempt to take many of the unconscious, informal controls under the domination of intelligence and purpose—to make them serve conscious, formulated ends.

The American sociologists first gave currency to the term social control, and earliest among them E. A. Ross by the publication of his book *Social Control* (New York 1901). Their work has been devoted largely to the study of social control in its wider sense, to exploring the forces by which the group molds and shapes the individual—forces such as custom, belief, public opinion, tabu and ceremony. Cooley contributed much to this analysis by his vivid studies of the social conditioning of the individual, and a score of sociologists here and abroad have helped to elaborate the description of the origin, nature and extent of the stimuli and restraints under which the individual lives. Anthropology too has been of great importance in building up an objective technique for studying the forms of social control. The detachment with which one views primitive people has brought the essential institutional relationships and forces into clearer perspective.

In its narrower sense, that is, as active intelligent guidance of social processes, the idea of social control is thoroughly characteristic of the twentieth century. Other periods have had the notion of "controls" and exercised them effectively, but none has had so clearly the concept of "control." This is due on its practical side to the unparalleled achievements in the control of nature which have continually appeared, whether in the form of new mechanical devices or the discovery of unsuspected natural resources. That the waste product of yesterday becomes the valued resource of tomorrow is almost the typical drama of the twentieth century. On its intellectual side the interest in control may be traced in large part to a reaction against the schools of Spencer and the economic determinists who thought of evolution as advancing more or less automatically, regardless of man's interference. Influential in this reaction were the writings of Lester F. Ward, who labored long and effectively to make clear the role of collective intelligence in our social life. Among contemporary writers L. T. Hobhouse in England

has been especially concerned to show how social evolution has come more and more to rest upon conscious control by the human mind. In America the institutional school of economics, whose outstanding figures are Thorstein Veblen, Wesley C. Mitchell and Walton H. Hamilton, has made important use of the concept of social control. Indeed, it is perhaps their central organizing principle. The emphasis of the institutionalists is that economic arrangements are man made and susceptible of almost limitless variation. While for most economists the idea of control is like a mechanical bit of apparatus, for the institutionalists it is more of the nature of the guiding formula itself.

It is the essence of the historic process that controls are constantly losing their validity and giving way to new ones. Both the nature and the agencies of control shift from age to age with the structure and functioning of society. Mediaeval society, for instance, affords illustration of controls in striking contrast to those of our own time. In the relatively static organization of feudalism custom and authority constituted powerful controls. Custom regulated the dues and services of the villeins as well as the rights and obligations of the lord of the twelfth century manor; it dictated the method of land cultivation; it prescribed the daily routine of work and recreation; it was an important factor in determining the relation of buyers and sellers in the towns. To the modern mind, however, perhaps the most interesting controls were the moral and religious restraints upon economic life which issued from the church relating chiefly to the just price and the prohibition of interest. These controls were enforced through the ecclesiastical courts as well as in the confessional and from the pulpit; they appear as part of the moral code in the ordinances of town and guild as evidenced, for instance, by the famous rules against "regrating, forestalling, and engrossing." Another great control of this period lay in the simple fact that personal relations were dominant in all the affairs of life. The face to face responsibility of master and laborer, of producer and consumer, constituted a type of control possible only in a world of small, self-sufficient units.

In the break up of localism that followed the widening of commercial life and the rise of a money economy there was a confusion of controls typical of every transition period. Out of this confusion there gradually emerged a system of control administered by a central

government, whose aim was a narrow nationalism dominated by an obsession in favor of a monetary supremacy. Through bounties, commercial treaties, colonial exploitation, high duties on imports and a vigorous policy of taxation the state built up its balance of trade. In pursuance of mercantilistic theory foreign trade, shipping and manufactures were encouraged, while agriculture and domestic trade languished. Everywhere the hand of the government was visible and its weight heavy.

The somewhat distorted controls of mercantilism led to a revolt toward the system now called economic individualism, or *laissez faire*. Men caught the vision of a society in which external controls should be replaced by checks and balances within the system itself. If men could only work when and where they pleased, develop any trades from which profit could be won and leave the control of quality to the consumer—free from guild and government regulation—both individual and national welfare would be served. The ultimate control of the system was individual self-interest seeking pecuniary gain and regulated by “the invisible hand” of competition, which could be relied upon to direct labor and capital into the most fruitful channels, apportion the materials of production, stimulate technical processes and finally distribute the products by “the magic of the price mechanism.” The thought of this period was greatly influenced by the physical sciences, and the controls of the economic order were regarded as analogous to those of physics. Debates ran in terms of trade and industry finding their own level, of wages and commodities tending toward a “natural” price, of the “law” of supply and demand. Man made controls such as legislators or reformers could devise were considered artificial and therefore vicious. Free enterprise itself was deemed a form of control more sure and more efficient than any man could achieve.

This cluster of presuppositions called economic individualism found acceptance as a theory of social welfare during the great exploitative period of economic life in the nineteenth century, when the stores of natural wealth and the miraculously developing machine technique seemed to promise all things to all men. In this period of wasteful opulence planned guidance of economic processes seemed superfluous. There arose, it is true, a number of reform movements, some broadly humanitarian, others Christian or aesthetic in origin, condemning the inefficiency, injustice or ugliness of the

system. But the nineteenth century in general lived with the conviction that progress was inevitable, that it was inherent in nature and in man. The unprecedented accumulation of wealth was unhesitatingly read as an increase in the general welfare—an interpretation which found happy confirmation in current religious beliefs. In this expanding milieu individual self-reliance and initiative had more than a fair chance to win their way and became therefore the great virtues of the economic system. This was particularly true in America with its wealth of natural resources and wide distribution of industrial opportunity. Until the virtual disappearance of the frontier neither the fact nor the philosophy of conscious social control could make much headway.

During the past few decades the interest in social control has been steadily gaining ground. The forces at work in this development are discernible at many different levels of our complicated corporate life. Largely as a result of the technological and economic changes of the past decades there has been a breakdown of individualistic assumptions in almost every field of thought, particularly in ethics, psychology, law, education and religion. The transformation is due primarily to a deeper and more subtle understanding of the interrelation of men and institutions. It is now realized that the individual is in great part what his town, his family, his recreation, his church or his club makes him. Interest therefore has tended to focus more and more on the control of determining social conditions. It is now an intelligible social question to ask “What shall be done?” Undoubtedly the Russian experience has contributed enormously in making vivid the possibility of a deliberate change in any country in both the instruments and the aim of control.

There exists today a vast multiplicity and confusing variety in the instruments of control. The government is in a sense the most obvious and clearly defined of these instruments, exercising wide powers through the general enforcement of law and order and the maintenance of many standards in the field of industrial and social arrangements. With the increasing complexity of social organization, particularly in urban development, the need for statutory regulations has increased. But regulation by law has for the average individual less immediacy and significance than a host of the more informal controls which surround him, such, for instance, as the agencies of information and communication—

the newspaper, the magazine, the radio and the movie. These pervasive influences are largely responsible for the building up of the complex thing called public opinion. They mold men's minds and fashion their tastes in everything, from the kind of words they use to the moral attitudes they adopt and the things they want to buy. It is through these agencies too, as well as other agencies of its own making, that the economic system creates the wants which it is prepared to satisfy. By advertising and a host of allied arts it exercises a continual selective pressure upon society, building up needs for specific goods and services. In the subtle hierarchy of twentieth century controls none is more persistent than this fashioning of wants and desires.

The family too must be accounted an important control, transmitting language, beliefs, ideas, tastes and standards. In spite of loosening bonds family influences are determinative for a large area of life. The family is the focus for getting and spending and for the bequeathing of property; in its relation to the industrial system it is largely responsible for the quantity and quality of the labor supply. Yet the incidence of family control is to a great extent accidental. It comes under the guidance of no generally accepted planning. This is also true of the agencies of communication—they echo a million different voices. Among them is conflict; their relation to each other is chaotic. How these controls are in their turn controlled and how they should be controlled, by what agencies and to what end, constitute a continual challenge to society.

This same challenge applies also to the educational system in school and college. Education is perhaps the most useful tool of social control but it works for militarists and class conscious snobs as well as for humanitarians and men of vision. In this as in other social institutions the critical problem is to keep it free from special interests and give it wise direction. Religion too has always exercised powerful control although with the waning power of the creeds it has lost much of its importance. Preachers today are coming to have only such authority as is possessed by writers and educators. They no longer bring a special kind of salvation nor can they dictate specific rules of conduct, because they can neither threaten penalties nor promise sure rewards.

The multiplicity of controls in modern society is perhaps most clearly illustrated in our economic life, where no consistent pattern or pro-

cedure is discernible. Most of our economic activities are still carried on by business organizations in accordance with the doctrine of economic individualism. Yet it need hardly be pointed out how far reaching are the modifications of free enterprise—through the network of legal relations and institutions on which the whole system rests, through state interference, through the transfer of important industries from the "automatic" control of the competitive system to the deliberate control by administrative commissions. There are too the controls exercised by trade unions, chambers of commerce, Rotary clubs and—increasingly important—by trade associations which gather and distribute data, conduct lobbies, engage in co-operative advertising and frame and promulgate codes of business ethics and standards of practice. Control through formulated codes, which played so large a part in guild activity and which has always been accepted in the professions, is coming to have more validity in business practice today, as business management becomes more of a science and is taught as such. Another type of control arises from the development of a better technique in the measuring art. As statistical information becomes more accurate, relevant and available, a new basis of control is established over a wide area of social life. Finally, business, like every activity, is carried on in a complicated social setting where habits, customs, conventions and tabus all blend together in intricate ways to determine daily procedure.

The role of the state as an agency of control in economic activity has long been a point at issue. In the nineteenth century reformers were inclined to rely largely upon the state for remedial action. The socialists of the period were state socialists. But in recent years there has been a marked tendency to rely upon more flexible and mobile instruments of economic control. This is due partly to the changing conception of the state as expressed in syndicalism and guild socialism but more to the fact that, while the war gave stimulus to the idea of cooperative action for a common goal, war experience also suggested that the state as administrator tended to be inelastic and clumsy. And while post-war problems emphasized the need of the guidance of rational policy as against the mechanics of free enterprise, state action was no longer seen as the only alternative to the absence of control.

The economic transformations initiated by the swift advance in technology call for cooperative action of a new kind and raise insistently the

ital query as to the appropriate form of control. It is becoming increasingly apparent that any number of individual judgments do not add up to a coherent policy in inaugurating a unified national power scheme or in dealing with a sick industry, such as coal, textiles or agriculture. The field for individuals acting in isolation has been rapidly shrinking. New instruments or agencies which shall express a point of view wider than that of the individual are needed to plan and to administer. This need for collective activity is well illustrated by the unemployment problem. We now see it as absurd, for example, to appeal to individual self-reliance and initiative to cure the industrial situation in Great Britain, where two million find themselves unemployed. In this as in other cases it is obviously the total situation which calls for control. But if planned guidance is to be the order of the day, what instrumentalities shall have it in charge? What interests shall be represented? Where shall be the locus of final authority? These are questions in which the problems of social control come to clearest focus. Certain trends of innovation in control are already discernible—an increasing participation of the workers in management, as witnessed by the whole gamut of schemes working toward "industrial democracy" and the setting up of administrative machinery apart from the state. It is significant, for instance, that in most countries the proposals for reorganizing the basic industries no longer read in terms of bureaucratic state administration but in terms of independent bodies, such as economic councils composed variously of representatives of consumers, technicians and workers, which function autonomously, giving to local units an important share in administrative responsibility.

Nothing is more characteristic of the modern period than the vast multiplication of voluntary extragovernmental agencies for the control of special aspects of the environment. One has only to think of the committees, societies, corporations, associations, clubs, conferences, leagues, organizations, institutes, foundations and bureaux—all advocating control of some particular aspect of the environment—to see what a vast area is thus covered. Proposals and counter-proposals, advocacy and protest abound. Modern life is largely reflected in this diversity of organization—from leagues to make us "air minded" to societies for the promotion of Mothers' Day or for the establishment of modern accounting methods. A good deal of this agitation is of only passing value; much is canceled by counter-

propaganda; but some of it, such as the birth control movement, has profound social significance. The basic fact in the modern situation is that the idea of control has become familiar. "We have attained," says John Dewey in his *Quest for Certainty* (New York 1929, p. 9), "at least subconsciously, a certain feeling of confidence; a feeling that control of the main conditions of fortune is, to an appreciable degree, passing into our own hands."

But what of the aims of control? Where is conscious planning to lead? Is this welter of controls moving toward some commonly accepted value? It seems that at present social control is under the domination of a number of scattered and disconnected objectives. Certain of these objectives are concrete and can easily be defined, such as the abolition of war, the elimination of inefficiency in its various forms, a higher standard of living for the lower levels of population. Beyond these specific ends, however, there are other goals more vague and yet discernible as motivating influences, concepts such as freedom, equality, the creation of more desirable human types or the enrichment of human life. These more shadowy objectives vary with time and place; society advances first under one banner and then another. But among these activities it is at present hard to find any coherent interrelation or any dominating purpose. Rather men are torn and distracted by the conflict of controls. Whether they can ever be in command of the total process is a difficult question. To achieve greater coherence society must have prophets, poets and artists to give a vivid sense of new values and a host of economists, engineers and technicians who will translate these values into specific measures.

CONVENTION, POLITICAL. As used here the term designates the system of delegate conventions which was devised in the United States more than a century ago for the making of party nominations and the adoption of party platforms. That system still survives in the national field and in some of the states; elsewhere it has given place to the direct primary. The European parties in developing an extra-parliamentary organization have resorted to conferences or congresses which resemble the American convention without discharging quite the same functions.

During the last decade of the eighteenth century, as the cleavage between Federalists and Republicans took shape, each party saw the importance of designating candidates in advance of an election. In local areas a meeting of the more prominent politicians sufficed. But in view of the difficulty of travel state wide nominations were entrusted to a legislative caucus; that is, to members of the legislature whom the party voters had already invested with a representative character. Similarly the presidential and vice presidential candidates were chosen by a congressional caucus. This system was well suited to a period of aristocratic leadership in politics. It gradually gave way, however, as the Republicans sought to offset the superior resources of their opponents in patronage and newspaper support by regimenting the voters and advancing to the attack in mass formation. Authority passed from the

rich and the well born to the rank and file of party membership. First the county convention of elected delegates appeared. Then, as the democratic ferment of the twenties stimulated organization, the new principle spread to larger areas. Everywhere the state convention superseded the legislative caucus. The congressional caucus met for the last time in 1824; for the election of 1832 Anti-Masons, National Republicans and Democrats all held national conventions at Baltimore.

By the middle of the nineteenth century the parties had perfected a remarkable organization that lay quite outside the constitutional fabric of government. Its form was hierarchical. Based on the mass of party members, who chose delegates at the primaries, it rose like a pyramid through successive electoral areas from aldermanic district to nation. Each area had its special delegate convention. In the lower ranges the delegates were chosen directly by the rank and file of the party; the state convention, on the other hand, consisted of delegates from the county or assembly district conventions, which might themselves be two degrees removed from the popular vote. Delegates to these conventions were usually apportioned among the units of representation according to the party vote polled at the last election. Each state sent to the national convention as many delegates as it had votes in the electoral college; that is, one for each senator and representative in Congress. Beginning in 1852 in the case of the Democrats and in 1860 in the case of the Republicans the number was raised to two for each electoral vote. All of these delegates might be chosen by the state convention, or else four by it and two by each congressional district convention. The Republican party in the eighties adopted the latter method, which still prevails except in the face of contradictory state legislation; the Democratic party has always left the method of choice to be determined by state rules. The various parts of this elaborate nominating system became closely articulated; for the national machinery, which touched the supreme interest of the party in electing a president, pressed down on the local machinery and forced it into a common mold.

Although hailed as an instrument of democratic control the convention system did not fulfil anticipations. From the beginning abuses manifested themselves. This voluntary and extra-legal system was much easier to manipulate than the caucus of public representatives had

been, and in the era of loose political morality that followed the Civil War professional politicians gained control of it and bent it to their corrupt and sinister ends. Since the abuses were flagrant, reform took a correspondingly drastic shape. Toward the end of the century a movement began which in the end, although less completely in the South than elsewhere, subjected party practise to legal regulation. The primary, upon which the whole edifice of conventions rested, was assimilated to the general election, with public officers in charge and with a secret ballot; the law even went so far as to fix the conditions of party membership; and to a certain extent the procedure of the conventions themselves was regulated.

These statutory guaranties might well have restored the prestige of an institution whose persistence for three quarters of a century seemed to establish a claim to popular regard. No time was allowed, however, to test their efficacy. A resurgence of Democratic fundamentalism brought forward new doctrines of political control. Beginning with the state wide mandatory laws of Wisconsin (1905) and Oregon (1910) the direct primary supplanted the delegate convention. There are today only four states in which the convention system stands intact: Connecticut, New Mexico, Rhode Island and Utah. In five others—Idaho, Indiana, Maryland, Michigan, New York—the state convention still survives; and in Iowa the convention is employed whenever the highest candidate for any office, state or local, receives less than 35 percent of the total primary vote.

For a time it seemed that the national convention would also disappear. In his message of December, 1913, President Wilson urged Congress to abolish it and substitute a national direct primary. Nothing came of that proposal; indeed, Congress is probably without constitutional power to effect the change. Meanwhile some of the states had sought to control the action of their delegates by means of presidential primary laws and thus to limit the convention's freedom of choice. By 1916 twenty-five states had enacted such laws. Enthusiasts believed that the convention would be reduced to the role of registering the votes of pledged delegates. Since that time, however, enthusiasm has cooled. The laws of five states have been repealed, the laws of two others held unconstitutional. The presidential primary can no longer be regarded as a menace to the discretionary power of the convention.

Not only has the national convention survived the tidal wave of direct primary legislation which swept over most of the states; it still conducts its business substantially without external control. There are limits to the possibilities of regulation by state law. Even if all the states—instead of the present minority—established preferential primaries and required delegates to support the local popular choice, the delegates would in ordinary circumstances recover complete liberty of action after the first few ballots in the convention. The explanation lies in the phenomenon of the "favorite sons." If there is no "general favorite" or no "logical candidate" (like Woodrow Wilson in 1916 or Calvin Coolidge in 1924), then the race is open, state pride asserts itself and a governor in this state or a United States senator in that is groomed for the nomination. In bringing him forward the politicians may have no belief in his ultimate success. They may be scheming to desert him and sell out to one of the leading candidates should the convention become deadlocked. The best way to deadlock the convention is to block the path of the favorite sons of other states in the local primaries; opposition to a favorite son in his own state, furthermore, involves serious hazards to "foreign" contenders both because of the ill feeling that may be engendered and because of the chances of a defeat that would puncture the illusion of general popularity. The presidential primary has thus tended to multiply the number of candidates for the nomination. Consequently, it has made and can make no serious inroads upon the freedom of the convention in selecting the presidential candidate.

The Democratic and Republican conventions differ somewhat in composition and procedure. In 1928 there were 1100 Democratic and 1089 Republican delegates. The difference lies partly in the fact that the Republicans abandoned in 1913 the practise of apportioning delegates strictly on the basis of the electoral vote of each state. The old practise had involved scandal and complaint; for the delegates from the solid South, which is overwhelmingly Democratic, represented little more than coteries of officeholders. The present rule of apportionment, adopted in 1923, gives each state four delegates at large and one delegate from each congressional district; three additional delegates at large if the state cast its electoral vote for the last presidential candidate of the party; and one additional delegate from each district which

cast 10,000 Republican votes. The territories and outlying possessions send thirty-eight delegates to the Democratic convention, ten to the Republican. As to procedure two peculiarities of the Democratic rules deserve notice: the rule that requires a two-thirds vote for the nomination of the candidates and the unit rule. The latter provided originally that all the delegates of a state, if so instructed by the state convention, must cast a solid vote as determined by the majority of the delegation. The rule was modified in 1912. It no longer applies to delegates who are directly elected in congressional districts under a mandatory state law.

The functions of the national convention are threefold: it adopts the party platform, names the presidential and vice presidential candidates and elects the national committee. First of all, however, disputed claims to membership must be settled. A committee on credentials considers each contest in turn, reviews the evidence on which the national committee based its decisions in making out the provisional list (temporary roll) of delegates and reports to the convention for final action. It has happened, although rarely, that the seating of certain delegates has determined the character of the platform and of the nominations. Another committee drafts the platform. Upon controversial issues that divide the party it usually manages to bring factions together in support of a compromise formula; but if it fails, a minority report will be made and the rift in the party emphasized by debate and vote upon the floor of the convention. The emotions of the delegates themselves and of the vast audience in the galleries are less likely to be stirred by questions of policy than by the flamboyant nominating speeches and by the dramatic shifts and turns in the subsequent balloting. When the name of a popular candidate is announced or when some state delegation swings its whole vote to him, a wild paroxysm ensues. The so-called convulsion or epileptic fit may continue for an hour or more, only to be succeeded by a new demonstration still more noisy and sustained in favor of a rival candidate. These scenes of almost incredible disorder have little effect, however, upon the outcome. Developments which may seem fortuitous are really the result of shrewd calculation. Crack politicians direct operations from the privacy of committee rooms; they are constantly manœuvring for advantage, conferring with the managers of rival candidates, negotiating alliances.

At last the break comes. By virtue of some secret understanding one of the chief contenders suddenly flashes ahead to the nomination; or else a "dark horse" emerges, a man who has scarcely been mentioned (except among the initiated) as a presidential possibility and who has been kept in hiding until the right hour has struck. Delegation after delegation, weary of the prolonged deadlock, shifts its vote to him. The convention is stampeded. Such situations do occur. Yet in a survey of the last half century deadlocks and dark horses will not often be encountered. In fact, two times out of every three there has been a "logical candidate" whose victory on the first or second ballot could confidently be predicted.

When judged in the light of its important functions the national convention must seem utterly inadequate. It is an assemblage of self-seeking politicians rather than statesmen. With 2000 delegates and alternates and a mob of more than 10,000 spectators thirsting for excitement it is incapable of deliberation and responds to the will of dexterous wirepullers behind the scenes. Meeting for a few days and then dissolving it escapes all responsibility. Nevertheless, its persistence for almost a century indicates its adaptability to the political environment; and, further, in a country of such vast area and such economic diversity, where politics tends to become sectional, it stands out as the great national gathering of the party and fixes attention upon the ideal of national unity.

CONVENTIONS, SOCIAL. Conventions are rules or standards of conduct or behavior prescribing what is to be done or not to be done by the members of a given group or community. Conventions are differentiated from legal rules, moral precepts and fashions by the degree or obligation felt toward their fulfilment, the kind of feeling evoked by their violation, the form

of the sanctions whereby they are enforced, the generality or range of the persons or interests they affect and their degree of permanence. They are generally held to be less binding and authoritative than moral precepts and legal rules and are often criticized in the light of moral ideals. When a convention is disregarded or a *faux pas* committed, one feels uncomfortable and the chagrin may be momentarily very acute, but upon reflection it is recognized as a temporary disturbance not comparable with the feeling of remorse experienced when a moral rule is broken. With regard to enforcement conventions lack the coercive authority vested in the machinery of government which law possesses in modern society, but depend upon the sanctions and compulsions of public opinion. They are generally confined to groups or classes of people, and members of other classes are not as a rule expected to live up to them, although if possessed of prestige value they may inspire emulation. Legal and moral rules, on the other hand, apply more generally within given communities. Conventions, although variable when considered over long periods of time, are relatively more permanent than fashions.

Conventions are best understood as habits of thought or behavior which have become generalized and almost automatic in their operation. The more automatic an act the greater the difficulty experienced by one acting in opposition to it, and a distinct sense of discomfort is felt when one observes others acting in a manner contrary to one's fixed modes of behavior. In addition to these factors, which are operative in all routine behavior and may prove susceptible of explanation in physiological terms, there are other psychological factors involved arising out of what may be called the normative aspects of conventions. In the sentiments, or groups of emotional dispositions, associated with conventions and condemning their breach there is present a rational element, the recognition, however vague, of the importance of order and the necessity of knowing what to expect and what is expected in given situations. Around these cluster the social feelings and impulses which give conventions their compelling force. In addition, all rules of action express attempts at adaptation to the needs of social life, efforts at mutual adjustment; and each convention is charged with the feelings which have inspired the adjustments which it crystallizes. When a particular convention is

violated, the shock experienced expresses partly respect for what is customary and partly a sense of maladjustment connected with the particular situation.

The mode of origination of conventions may best be analyzed by considering how they change. They appear to change by a process of crumbling and partial attrition; minute changes are made until at last complete transformation has been effected. So it may be with origins. The efforts at adaptation made by individuals are gradually generalized or in cases of clash and conflict are mutually modified until a common line of behavior is established.

The explanation of the diffusion of conventions in terms of a postulated inborn tendency to imitate must be received with caution. Distinction must be made between cases in which the acts imitated are themselves spontaneous and cases in which acts new to the individual imitating are provoked by his observation of their performance by others.

The value of conventions is most easily observed in types of conventionalization which have no moral reference. Thus, for example, language is a system of conventional signs and all sciences employ symbols which facilitate thought and communication. In these cases convention secures a correspondence or concordance of representation and interpretation which is of the highest utility in the development of cooperative effort. In a similar manner the existence of well understood rules of behavior facilitates social intercourse and serves to make social life run more smoothly. The abuses and dangers of conventions arise from the tendency of habits to become automatic and to thwart new or spontaneous tendencies. Conventions arise out of an indefinite number of interactions between individuals and contain elements of spontaneity and even of inspiration, but once formed they tend to become fixed grooves confining and controlling future action and thought. Societies ruled by conventions are apt to resist new ideals or, when forced to make terms with them, to transform them beyond recognition. The originality and spontaneity of individuals is thus smothered in tradition, and their ideals are decked out with conventions which take all the life out of them. If all men and all classes of men had the same interests and were equal in discernment and if circumstances never changed, conventions would afford an automatic solution to the problems of social life. In fact, however, the process

of adjustment involves conflict between classes with divergent interests and men of unequal critical powers, and the resulting convention is not always that form of behavior which would be best from the point of view of society as a whole. In this way conventions are made to serve as instruments of snobbery and class prestige and become serious obstacles to new adjustments.

CONVERSION, RELIGIOUS. Conversion applies to a marked "change of heart," an emotional regeneration, typically sudden in its advent or consummation, affecting radically the outlook, the inner adjustment and the habits of life of an individual. The standard reference of the term is to a religious experience. It may take the form of a conviction of a revelation, of communion with the divine, of assurance of salvation; its psychological effect is a sense of spiritual ease and security, a resolution of conflict, a singleness of devotion to an accepted principle, a surrender of self to a higher cause, a delightful sense of reconciliation. The need of conversion arises from, or is strengthened by, a troubled feeling of sin or guilt, of unworthiness and incompleteness. A deep measure of actual sinfulness is not necessary to the experience; indeed, the exaggerated feeling of guilt for slight deviations from the moral code is often characteristic of those who have been converted. On the other hand, recoil from a life of indulgence is no less common as a phase of conversion. The conversion of the drunkard, typically by a religious appeal but at times through emphasis on a moral issue only, is of the same order. Such cases warrant the extension of the term to any reformation that reclaims the convert from a life of crime, from antisocial attitudes — a right about face in the central personal life.

Conversion is most important as a chapter in the history and psychology of religion. Among

primitive peoples few phenomena of the type associated with conversion have been observed. This is undoubtedly due largely to the fact that religious acts and beliefs are so intimately merged with all the major life interests that group membership implies undeviating participation in the cult with no occasion for any sort of assumption of new religious loyalties. In fact, it can be said that until the development of great historical religions the individual's faith was so deeply imbedded in the mores that he had little choice in the matter of belief. Conversion as a theological doctrine is thus comparatively recent and has only developed gradually to meet the problem of the skeptical doubts and even backslidings in faith consequent upon increased contacts with other peoples and other religions. Thus in the Old Testament conversion meant a return to the fold, or "realizing one's own nature again," and was to be attested significantly by a return of material prosperity to the faithful. In Christian thought generally conversion was conceived to be the chief object of the church. This meant to the Catholic complete submission to the church and to Protestant sects redemption of each soul out of his original sin by divine grace. Evangelicalism has resulted in an even greater emphasis on conversion. Among typical proselytizing religions conversion has been made extremely easy, so that it is possible, for example, for entire tribes to be converted to Hinduism by the use of flimsy historical fictions. All that is required of a man in order to become affiliated with Mohammedan sects is the repetition of the *shahadah* formula, "There is no God but Allah and Mohammed is his prophet." In most of the Buddhist sects, however, conversion takes on more of an imperceptible and passive character, due largely to the philosophical and rational nature of the religion.

This experience of a rapid and striking change in the orientation of belief has been most often associated with religion, but a very similar process is to be found in social reform movements of certain types. Radicals, reformers, prophets, new sects, humanitarian cults, idealistic communities, withdrawals from the accepted modes of life and an array of esoteric movements proceed with some emphasis on conversion and with use of the propaganda that makes recruits to a special faith. A specifically religious factor is usually present even in such movements, which are characteristically pervaded by a messianic, revivalist, revelatory pioneering spirit and marked by dramatic and

fantastic episodes of conversion among leaders and followers alike.

Intrinsically conversion is an individual experience; certainly it has been such in the case of the great converts, especially those who upon such commanding compulsion have founded a religion or entered upon a sanctified life. Yet many conversions result from the influence of tradition and example, from knowledge of the experience of others and from direct social pressure on the part of organized faiths. Thus conversion is most common among faiths which emphasize the value of the experience and are organized to incite it through revivals or other evangelical techniques. Under such conditions the phenomenon passes into the orbit of the crowd appeal, the contagion of numbers and the accompanying mass excitement. Yet, by whatever means conversion takes place, the individual susceptibility to the experience remains decisive.

Conversion is predominantly a phenomenon of adolescence. A recent survey by E. T. Clark, *The Psychology of Religious Awakening* (New York 1929), bears out the conclusions derived from general observation. It indicates that the average age of those who experience the change as a crisis is about seventeen, but it is lower by three or four years if milder types of emotional stimulation are included in the definition. About 57.7 percent of the men and 71 percent of the women studied experienced only a gradual growth in the religious life; only about 6.7 percent passed through a critical or acute stage of conversion. There were marked group and sex differences, however; thus among Negroes acute conversion was experienced by 25 percent of all those studied and in the total group it occurred in the case of 2.5 percent of the women and 14.6 percent of the men. A marked decline in the frequency of conversion in recent years is indicated by the fact that 35.8 percent of those over forty years of age recorded a critical conversion; interestingly enough the same proportion held for those of younger age groups who had been subject to a stern theological training. Rural communities where the older religious attitudes survive show three times as many who have experienced a crisis as compared with cities. Conversions have been to a large extent "typed by a theology which insisted upon them."

The immediate incentives to conversion vary; probably at the most youthful age social pressure dominates, at the pivotal age the sense of sin and fear play an increasing part, while later

the motive shifts to the moral ideal of a righteous life. Conversion is most frequently a specific accompaniment of the adolescent storm and stress, of the distracted search for a goal or a haven of belief in a period characterized by a pervasive emotional unrest deeply colored by erotic yearning. Conversion precipitates and hastens the organization of the personality. Many individuals are immune to the experience, some through lack of sensibility to the invisible and the spiritual, others through temporary inhibitions which disappear later in life. James regarded as the psychological component of susceptibility to conversion the temperament with a large and potent subconscious life as opposed to those whose direction is dominantly conscious and reflective with meager margins for subconscious activity. The temperament favorable to conversion also favors automatism in other directions. In marked instances the phenomenon is definitely hypnotic, allied to trance states, and may induce hallucinations and motor disturbance, convulsive or passively ecstatic. Moreover, the technique for producing automatic and hypnotic phenomena is similar to that employed in stimulated conversion. The existence of emotional waves during revivals indicates the contagious factor which must have been present in hysterical outbreaks and psychic manias of past ages as well as in those of modern times. Starbuck classified the converted into those proceeding more by self-direction, the "volitional" type, and those who yield wholly to emotional abandon, the type of "self-surrender." Both attitudes result in states of ecstasy or "unselfing." The analogy to faith cures, to mediumistic control, even to purging by way of psychoanalysis, is clear. A more recent writer, Schou, points out the pathological nature of some of the manifestations, such as that of the depression period preceding exaltation, particularly in the case of youthful subjects. The closeness of the analogy to the automatic states, mediumship and automatic revelation is increased by the often overlooked existence of a period of incubation, which makes the conversion less abrupt and sudden than it appears.

The value of conversion is variously appraised by adherents of different persuasions. The modern educational temper distinctly favors the more gradual growth as the more normal, with the avoidance of the intense experiences of conversion with their menace of hysterical and psychopathic development. There has been considerable difference of opinion as to the

permanence of conversion. Some hold that despite the frequency of backsliding changes in those who undergo the more critical experience are as enduring as in those who come to their convictions more gradually; others question whether there is a more marked change in the way of life of those who have been converted abruptly through stimulated excitement than in the case of those who attain their ease of mind and settled guidance by quieter, more gradual unfoldment. The general impression that the cruder forms of conversion are characteristic of those of lower mental levels is probably correct; on the other hand, it is well to recognize with James that "there are higher and lower limits set to each personal life," and that "a small man's salvation" will still be a great fact for him. One can thus endorse Emerson's view that even "poor Crump" no less than the most regal of characters is the better man for a sense of compunction.

COOKE, JAY (1821-1905), American financier. Cooke accumulated his initial wealth as a partner of Philadelphia bankers whose employment he had entered as a clerk. In 1861 he established a banking house of his own. Soon after he worked

out successfully popular methods of bond selling in support of the Union and was made sole private fiscal agent for a large part of the war and post-war issues. To raise the relatively heroic sums required he made extensive use of advertising, systematically cultivated the press and aimed directly at the classes which commonly did not invest, mingling the arguments of patriotism with those of thrifty security. Cooke's compensation, probably moderate as bankers' charges go, amounted in the aggregate to a comfortable fortune. By argument and example he aided in setting up the national banking system, which became a timely market for government securities, a feature not without appeal to a fiscal agent. Intimate past experience with the currency and solvency of state banks added to his enthusiasm. Involving himself later in land speculation and a connecting railroad to the lake head, Cooke became interested in the Northern Pacific. The popular technique and prestige of the war years were capitalized in raising funds for the transcontinental route. Unrealizable assets in the shape of construction advances contributed to the suspension of his chain of banking houses and precipitated the panic of 1873. Cooke retrieved his losses by a happy mining investment.

Cooke's personality was insistent and imperial. He was a shrewd economic analyst of political events, of which he kept himself intimately informed when they concerned him. He used such methods as the times demanded to secure authority for what he wished to do. His mind was clear as to the more personal benefits likely to result from campaign contributions. A genial hospitality served him as a useful instrument.

COOLEY, CHARLES HORTON (1864-1929), American social philosopher. He was the son of Thomas M. Cooley, distinguished jurist and professor of law at the University of Michigan, where, as undergraduate, graduate student, instructor in economics and professor of sociology the younger Cooley spent his entire life.

Cooley was a shy, unobtrusive person handicapped by an impediment in speech and partial deafness. His lectures were filled with such quiet

phrases as "it seems to me" and "often I wonder"; his writing is of an almost classic simplicity quite free from academic pretentiousness. He did not dramatize issues or combat conventional creeds. He was more concerned with questions than with answers, with the starting point than the march of the argument. His attack was never direct; he was content to raise problems, present points of view and suggest leads; he trusted the mind of his reader or hearer to carry on to the practical result.

What he had to say too appeared very simple. Life is a single whole; if it is to be understood it is to be seen complete; if it is cut up it dies. Its meaning is to be found by attention to process. Men are born into communities; communities are made by men. The ideas and usages which make up the social order are interrelated and changing; they cannot be set down in mechanical formulae. Society is not an aggregation of individuals; the individual is not a part of a social organism. Society and the individual are inseparable, complements rather than antitheses, constantly remaking each other in an endless process of institutional change. This theme, with the varied detail of man's many conventions as accompaniment, runs through his trilogy on social theory. It was all very obvious—once Cooley had set it down.

Its elementary character makes Cooley's work of outstanding importance. It scraps as irrelevant or limits as narrowly useful a mass of professional crudition; the theory of value as an explanation of the economic order is an attempt "to tell time by the second hand of a watch." It reveals the industrial system as a more or less orderly complex of arrangements not different in kind from the conventions which make up the state. It invites realistic studies of man's institutions—the market, marriage, education, property, freedom, the press. It discards an outworn individualism and presents an adequate intellectual basis for a program of social control. It enables contemporary society to be studied and directed in terms of contemporary thought. Cooley concerned himself little, however, with passing causes or current reform. As an intellectual radical he was intent upon getting to the root of the matter. His work was to free the study of man in society from bondage to the intellectual system of time and place.

COOLEY, THOMAS McINTYRE (1824-98), American jurist. The appearance of Cooley's *Constitutional Limitations* in 1868 with its leading doctrine of implied constitutional limitations upon the legislative powers of the states, apart from the provisions of their written constitutions, marked the turning point in the history of American constitutionalism. The present wide scope of the doctrine of judicial review makes it easy to forget that originally it was only of narrow application. The federal constitution contained limitations upon the states only in such clauses as the contract clause, and the due process clauses of both the state and federal constitutions were regarded only as procedural safeguards. The conservative perceived that the doctrine of judicial review would be an inadequate defense against popular encroachment without a broadening of existing constitutional limitations; and some of the early judges like Paterson, Marshall, Chase, Kent and Story sought to find extraconstitutional limitations for the protection of vested rights by appealing to the "higher law" philosophy of the social compact and to natural and inalienable rights. These attempts were arrested, however, by the triumph of Jacksonian democracy, and until about the middle of the nineteenth century the state legislatures were virtually supreme. Their powers did not begin to be discredited until the panics of 1837 and 1857 brought into question their enormous expenditures for public improvements and their authorization of subsidies to the railroads.

It is significant that Cooley's *Constitutional Limitations* appeared shortly after the Civil War and in the very year of the adoption of the Fourteenth Amendment. The war, undermining the powers of the states, had strengthened the conservative reaction. Cooley's was the first work to deal in a systematic manner with all the limitations resting upon the states; previous works on constitutional law had been concerned only with the federal constitution. Cooley be-

lieving that written constitutions did not so much create new frames of government as embody the past political experience of a people, deduced his implied constitutional limitations from this background rather than from any notions of higher law, which indeed he expressly repudiated. But it is clear that he had merely discovered a more persuasive formula, simply taking the results of the early higher law cases to support it. His implied constitutional limitations, derived from such ideas as the separation of powers, checks and balances and constitutional government in general, have an extremely wide range: legislatures could not interfere with judicial functions; taxation could be lawful only for a public purpose and the power of eminent domain could be exercised only to take property for a public use; legislation could not be of a special or discriminatory character; and, above all, vested rights could not be divested even apart from the due process clauses of the state constitutions. Yet Cooley was in fact the first American text writer to engage upon an extended analysis of the concept of due process and to conceive it broadly as a bulwark against every arbitrary interference of government, thus preparing the way for the interpretation of the Fourteenth Amendment as it came to be accepted by the Supreme Court in the eighties. Cooley believed his conclusions to be justified by precedent, but his creative role is evident from his insistence, among other doctrines, that taxation must be for a public purpose, a rule clearly against the weight of existing authority but useful in checking the action of the state legislatures in favor of such private corporations as the railroads. The very variety of the state constitutions often led Cooley to disregard individual differences in favor of broad general principles. Moreover, his conservative emphasis upon property as opposed to personal rights came naturally to him as a product of the frontier. Born in a remote rural section of New York and emigrating to Michigan, he had despite the handicap of poverty and the lack of formal education succeeded in becoming judge of the Supreme Court of Michigan, a position he held for over twenty years.

In his later years Cooley played an important part in railroad regulation, especially as chairman of the Interstate Commerce Commission for the first four years of its history. During this period he dominated the commission and was largely responsible for turning it into a quasi-judicial body. He constantly sought for

ruling principles of rate regulation and in some of his decisions and reports contributed to the theory of rate making.

But neither his judicial nor administrative services nor any of his later books can be compared in the importance of their effects with his *Constitutional Limitations*. In the decades after its publication it was the most frequently cited work in American constitutional law. Bryce submitted his *American Commonwealth* to Cooley for examination. It has been said, and probably without too much extravagance, that Cooley is as important in American as Coke is in English constitutional law. Cooley's doctrine of implied constitutional limitations must now seem startling if, indeed, it really remains comprehensible. But far from becoming obsolete it has become assimilated under the "rule of reason" in the extremely broad interpretation of the due process clause of the Fourteenth Amendment that now prevails.

COOLIE LABOR. See CONTRACT LABOR.

COOPER, PETER (1791-1883), American manufacturer and philanthropist. Cooper amassed a large fortune in the manufacture of glue, isinglass and iron and by trading in railway stock. In 1830 he built from his own designs the first steam locomotive constructed in America. He invested large funds in the Atlantic cable project and was president of the North American Telegraph Company. He is best known for the establishment in New York in 1854 of the Cooper Union, still in operation, which was founded to provide young men and women with free practical and technical instruction. While a member of the New York Board of Aldermen he

advocated the introduction of paid police and fire forces. Believing that the economic hardships of the decade following the Civil War were primarily due to an unstable currency Cooper entered current politico-economic controversies and became the Greenback party's candidate for the presidency in 1876, advocating the stabilization of greenbacks by making them interchangeable with government bonds bearing an annual interest not exceeding 3.65 percent. He also hoped that by making bonds convertible at will into currency the government would be saved from the necessity of selling them abroad. He opposed the issue of banknotes, asserting that the right to issue currency should rest only in the hands of the national government. Despite the extensive disaffection throughout the country Cooper received only 81,700 votes, less than one percent of the total.

COOPER, THOMAS (1759–1839), English-American publicist and educator. During the greater part of his life Cooper was a rather typical eighteenth century libertarian with a general intellectual outlook not unlike that of his friend Thomas Jefferson. After leaving Oxford he identified himself with the liberal school of English reformers and during the first years of the French Revolution his optimism was unbounded. Disheartened by the excesses of 1793 but still clinging to his democratic illusions he emigrated to Pennsylvania, where he exerted his unusual polemical skill in the service of the Jeffersonian Republicans. But the opportunity of observing at first hand the inner workings of the American party system served to convince him that democratic government was “not quite so perfect in practise as beautiful in theory.” In reality, he was forced to conclude, capricious tyranny was as potential a danger under a pure democracy as under a monarchy or a privileged aristocracy. He abandoned active political life in 1811 and entered upon the rather stormy academic career which was to carry him nine years later to South Carolina College at Columbia. The extent of Cooper's reaction from his earlier rationalistic liberalism may be gauged by the

role that he played in South Carolina, both as educator and polemist, during the period of transition (1820–30) from the broad abstract Jeffersonianism which hitherto had colored practically all southern ideology to the precise and highly refined realism of Calhoun, which was to serve as the doctrinal justification of the aggressive southern movement during the three decades preceding the Civil War. Jefferson with his physiocratic leanings had consistently defended the agrarian interests against the program of the Federalists. This tradition Cooper continued by his able and forceful attacks on the successors of the Federalists and what he considered their unconstitutional and economically unsound “American system.” The Jeffersonian tradition of decentralization was carried to somewhat extreme lengths by Cooper when in 1827 as a protest against the activities of the industrialists and protectionists he sounded a novel and startling note by publicly calling into question the value of the Union. But on the other hand, he cut the ground from under the older Virginia system and prepared the way for the “South Carolina movement” by repudiating the philosophy of natural rights—the foundation not only of Jeffersonianism but of the entire liberal tradition, which Cooper himself had previously done so much to publicize. To Jefferson slavery was an obsolescent phenomenon, a contradiction destined soon to disappear. Cooper at the sacrifice of his earlier humanitarianism found for it an honorable place in the eternal scheme, and his realistic arguments are particularly significant as pioneer steps in the reorientation of the southern attitude toward the rapidly expanding institution. He was not, however, a systematic or original thinker and was overshadowed by Calhoun as the outstanding spokesman of southern interests. Cooper's remarkable fund and diversity of acquired knowledge as well as his enlightened views of education rank him high among early American educators. He did much to popularize the doctrines of the classical economists and at South Carolina College inaugurated a department of political economy—the second of its kind in the country. His vehement anticlericalism, which had involved him in endless controversies, throughout his academic career, finally resulted in his resignation from the college in 1834.

Theory in Early American Economics (New York 1921) p. 53-59; Schlgman, E. R. A., "The Early Teaching of Economics in the United States" in *Economic Essays Contributed in Honor of John Bates Clark* (New York 1927) p. 302-20.

COOPER, THOMAS (1805-92), English poet and agitator. Cooper, a self-educated man, the son of a dyer, became one of the principal literary figures of Chartism. Entering its ranks at Leicester in 1841, he became a leader of the "physical force" wing in the second great wave of Chartist agitation. He was arrested and sentenced to two years in Safford jail for alleged inciting to riot and while in prison composed his best known work, *The Purgation of Suicides* (London 1845; 3rd ed. 1853). His argument is developed by long colloquies among famous suicides from Lycurgus to Castlereagh, the dénouement representing a final conclave of all the characters as democratic equals. It was during his imprisonment that Cooper wrote much

of the two volumes of sketches entitled *Wise Saws and Modern Instances* (London 1845), which contain some of the earliest descriptions of the terrible misery and starvation prevalent during the hungry forties, particularly in the great industrial centers. Cooper was also an influence in the field of popular education, to which cause his principal written contribution was *Eight Letters to the Young Men of the Working Classes* (London 1851), an advocacy of the only course then open to the lower orders, self-education. All these writings express the new spirit of working class consciousness and solidarity of which Chartism was an early manifestation. Converted from "secularism," he spent the latter part of his life writing and speaking on Christian evidences. His autobiography, *The Life of Thomas Cooper, Written by Himself* (London 1872; 4th ed. 1873), was the source of much of Kingsley's *Alton Locke*.

GENERAL SURVEY. When around 1820 Robert Owen advanced the concept of cooperation as the basis of a new social and economic order he

contemplated something far more purposive and conscious than the involuntary and formless cooperation which is co-extensive with society it-

self, and which in Owen's day was being further enforced by the ramifications of the industrial revolution. He opposed cooperation to the principles of laissez faire and competition as a regulating device through which individual profit seeking could be made to serve a common good. Owen did not hesitate to suggest the setting up of a community which would be isolated and self-sufficient in its economic and social activities. In similar fashion Fourier, in his use of the term association, stressed a purposive rather than a haphazard or involuntary association.

The proposals of these two precursors of the cooperative movement bear a far greater resemblance to the communistic colonies which preceded and followed them than to the working class cooperative movements which sprang up partly out of the impulse given by their ideologies. Two important contributions were, however, made by them. The first was the complete ignoring of the political state as the instrument of change, and the second was the principle of voluntary grouping for the purpose of self-employment as well as self-government.

Within a generation, however, as the power of private enterprise and the capitalistic system grew to such an extent that individual efforts to stem its current seemed futile, another type of cooperation, which had an integral association with the political state, was brought forth as a revolutionary program for the large masses of the urbanized industrial population. Thus in France the plan of Louis Blanc for cooperative workshops to be financed at the outset by the state had a considerable appeal. In Germany, still later, the socialism of Lassalle looked to the state as the instrument for the setting up of cooperative workshops.

The failure of revolutionary uprisings and the disastrous experiment with the *ateliers nationaux* in France during the Revolution of 1848 caused a return to the program of economic action through self-help, in which trade unionism and the establishment of voluntary cooperatives played at various times complementary and rival roles. In France Buchez advocated the cooperative workshops, but this time on a voluntary basis without the authority of the state, and gave the impulse to a movement for producers' cooperation which was taken up by the working classes, by philanthropic employers such as Godin and Leclaire and in England by the Christian Socialists. Even further removed from a revolutionary concept of cooperation

were the plans of the Germans, Victor Aime Huber, Eduard Pfeiffer, Hermann Schulze-Delitzsch and F. W. Raiffeisen, who visualized the cooperative organization operating within the existing system as a protective device through self-help for those in the lower middle and working classes.

Meanwhile, beginning in the late forties in England and somewhat later on the continent, cooperative organizations of various types arose among the urban and rural masses. Some of these developed spontaneously partly as a result of the impulses given by ideologies and leaders or else were closely affiliated with socialist and other working class movements; still others were sponsored by governments and by the Catholic church. The industrial workers of England, particularly in the textile centers, began with the Owenite concept of self-employment in workshops for which the cooperative store was to furnish capital and built up a vast distributive store movement copied by the workers of France, Switzerland and the Scandinavian countries. Germany became the birthplace of the credit movement, primarily for agricultural communities, although it also served tradesmen, small manufacturers and skilled artisans with credit for production and consumption needs. Agricultural cooperative organizations of other than the credit type for marketing the produce of farmers, for purchasing equipment and fertilizers and for the manufacture of dairy products appeared in Europe, the United States and the British overseas dominions. France was outstanding in its development of the cooperative workshop movement, which spread to England and the United States, where, however, it did not survive the inroads of large scale industrialization.

In the minds of the leaders of most of these movements there was no necessary conflict between the various forms of cooperatives. So far as the internal organization of the associations themselves was concerned, the term cooperative had some basis in common practices: voting was on the principle of individual membership rather than of stock held; membership was open; dividends on capital were fixed or limited; occasionally share holdings were limited; provisions were made for the return of surplus to the members on the basis of patronage, a fraction of this surplus being retained usually in a common fund for the furtherance of the ends of the cooperative organization. In some of the agricultural marketing associations the are

additional clauses usually providing that as regards the product concerned the member is to do business only through his association. Thus competition between members is modified or eliminated, and the profit making motive is subordinated to advance the general good. These common attributes form the basis for the special cooperative legislation which distinguishes the cooperative association from the ordinary commercial enterprise. Most of the organizations also contemplate the elimination of the profit of the middleman—storekeeper, money lender, employer—especially when the superior bargaining position of the latter groups menaces the living standards of the groups so associated.

When the local and national cooperative federations were first formed they included all the types of associations mentioned above, and comprehensive federation took on international form in the International Cooperative Alliance founded in 1895 as a propaganda and advisory body. But economic and social developments, including the rise of socialistic movements, brought to the foreground in each country differences in point of view and of function which led to conflicts between the various types of cooperatives in their local spheres of operation and to splits within the national federation and the international body. Thus in England, as the cooperative workshops failed to take hold in industries requiring considerable capital and serving a general market, succeeding mainly in those industries which depended more on labor output than on capital, and as the quietly expanding consumers' movement through its wholesale society entered upon productive undertakings supplementing or competing with the cooperative workshops, the prestige which the producers' cooperative movement had held within the British Cooperative Union was shaken. Eventually the consumers' productive enterprises either replaced the cooperative workshops or absorbed them in all but certain industries; since both movements had a radical working class membership which agreed on the conscious use of cooperation as an instrument of social change, no split occurred within the union. About 1900, however, when the consumers' movement entered the field of agricultural production it encountered a well established conservative rural movement. Although the question of interrelationships between the two groups has led to no permanent split within the Cooperative Union, it has by no means been

resolved and many of the rural bodies have kept aloof from the union. Where intertrading has developed, however, the agricultural societies become members of the consumers' wholesale societies, and a system of mutual benefit is thus developed, including the extension of credit facilities by the wholesale society's bank to the agricultural cooperatives.

In Germany the movement had originated in rural and urban communities and was marked by a mixture of agricultural, trading and manufacturing enterprises. It was a liberal, middle class and peasant movement. With the development of an urban proletariat in the nineties a consumers' movement, politically neutral but led by trade unionists with social democratic sympathies, came into being, and a split in the comprehensive national federation became inevitable. A similar evolution took place in Austria.

Conflicts occurred especially in some of the border line processes between consumption and production, as for instance when both consumers' and agricultural societies sought to operate plants for the manufacture of butter and cheese, when agricultural associations opened their own markets in town and so on. There ensued the usual clash between seller and purchaser, aggravated by the differences in approach of the peasant class and the urban proletariat. The former saw in the consumers' societies merely the urban buyer who sought to reduce prices without regard for the producers' costs and risks; the consumers' societies, on the other hand, saw in the emphasis on price merely a profit seeking motive of a group which had the potentialities of developing into a monopoly. In countries where the division between town and rural district was not so marked, as in the Scandinavian countries, these conflicts either did not arise or else were resolved by arrangements satisfactory to both groups: a joint wholesale society which acted as the agent for purchase of the producers' output and its sale to the consumers' societies or else membership of the individual within both types of society. This is especially possible in such countries as Hungary, where the consumers' movement is largely rural. The differences of occupation and of regional grouping were reinforced by differences of religion, of political and social outlook and, in the case of the movement in the pre-war Austro-Hungarian empire, of nationalistic minorities. When these differences assumed sufficient importance to be brought before the

national federations, however, the conflicts of interest became conflicts of fundamental approach in social attitude and resulted in the splitting off of the separate movements. This tendency reached even the International Cooperative Alliance in 1904 and resolved itself into a difference of point of view over the matter of state aid to the agricultural and credit co-operatives. Thereafter, the latter formed their own international body.

The essential differences in function have led such students of cooperation as Eduard Jacob and M. I. Tugan-Baranovsky to attempt more fundamental classifications than those in common usage. It is obvious that the classification into consumers' distributive, agricultural, credit and producers' cooperation adopted by the International Cooperative Alliance is at times an artificial one, since many of the credit societies, notably those in the United States, are mainly for immediate consumption needs, since consumers' societies engage in production and so on. The classification of the Horace Plunkett Foundation into cooperation for consumption and cooperation for production has the advantage of stressing the fundamental approach, but it does not exclude classificatory inconsistencies.

When, however, cooperative trade like ordinary commercial trade became more international in scope, a new evaluation of cooperative interrelations, which again stressed common characteristics rather than distinctions, was made necessary. As early as 1913 Heinrich Kaufmann of the German consumers' movement suggested to the International Cooperative Alliance that international relations between the producers' and consumers' societies be established not only for propaganda but for actual trading and financing processes. An international wholesale society and a committee on international banking were created by the alliance in 1921 but have functioned mainly only for advisory purposes. Subsequently at its initiative the League of Nations and the International Labour Office made studies of the extent and nature of international cooperative organizations and of their trading relations. In the meanwhile, however, the British consumers' movement, which is necessarily a large importer of food and clothing stuffs, established trading relations with the agricultural cooperatives of the overseas dominions and with other countries, particularly Russia. It set up international cooperative export bodies, financing them and assuming a control in them as copartners. Thus

in 1921 it participated in the formation of, advanced credit to, and achieved representation on, the New Zealand Producers' Association and the Overseas Farmers' Cooperative Federations. The English wholesale society and its bank are important copartners as well with the Russian export cooperative, Exportkhleb, in the Russo-British Grain Export Company, established in 1923. The Austrian consumers' movement has a similar permanent organization, the Ratao, for dealing with the Russian export cooperative. In addition to these specially created agencies the English cooperative wholesale without setting up any new machinery deals with the wholesales and the cooperatives of other agricultural countries, purchasing all the exportable produce of the Finnish cooperatives, half of its butter supply through the Danish cooperatives and so on. The cooperative wholesales of the four Scandinavian cooperatives have set up a joint whole sale society which purchases for them from industrialized countries and has extensive inter-trading relations with the British cooperative wholesale.

The creation of a genuinely international cooperative wholesale, interrelated with an international cooperative bank, is now being much discussed in cooperative circles. Such an agency would carry on in organized fashion the now haphazard intertrading of cooperatives; it would by acting as agent remove the difficulties which arise when the purchaser and agent are one, as they are at the present time in international cooperative trade. It would dispose of the surpluses of the producers' organizations and provide a new membership for the manufacturing enterprises of the consumers' societies; it might set up productive enterprises in those commodities which require more capital than is available for a national enterprise or the demand for which in a single country is not large enough to warrant cooperative production; or it might set up productive enterprises in countries where no cooperatives as yet exist, as the English wholesale society set up its own tea plantations in Ceylon and elsewhere. Such a type of enterprise carries with it of course the risks of penetration of foreign capital and its concomitant exploitation of native labor. As a result of this tendency there may evolve a new union of cooperative forces based on common economic interests rather more than on a common ideology.

A critical survey of the cooperative movement raises certain questions, however, concerning its

effectiveness first as an economic enterprise existing side by side with ordinary commercial enterprises and secondly as a rival form of social and economic organization. The industries and services in which capitalistic enterprise is of the greatest significance and power—the fuel, light, power and transport industries and banking services, for example—have hardly been touched by the movement. It is true that in Germany agricultural cooperatives and in Belgium and Austria “cooperative public boards” have entered these fields, that elsewhere on the continent housing has become a public utility of a semicooperative nature and that the cooperative organizations have entered the banking and insurance business. But their expansion in these fields is thus far infinitesimal compared with capitalistic expansion; they remain powerful bargaining factors mainly in the provision of foodstuffs and, to a far smaller extent, clothing. Even in England the productive enterprises have not expanded sufficiently to supply a large proportion of the needs of the members. Even less satisfactory is their solution of the labor problem. The old ideal of self-employment is obviously impossible in an enterprise which has a membership of six million and a working force of a quarter of a million, and although working conditions for this group are equal to or above those of the ordinary competitive enterprises, the cooperative enterprise is not in a position to depart widely from prevailing standards.

Critics of the movement stress the fact that the only instances in which the movement has kept its ideological fervor and has represented a new economic and social order have been in those countries in which it is linked up with other movements—the trade union movement and the Labour party of Great Britain, the folk school movement of Denmark, the socialism of Belgium and, even more decisively, the communism of Russia. Thus its claim to a sphere of operation outside the political grouping and to independence or superiority over other forms or methods of social transformation is challenged. Where no such connection has existed the movement has no permanent hold, as in the United States, or else its sphere of operation is restricted to merely ameliorative or limited reforms.

Nevertheless, in spite of these criticisms and in spite of the differences existing within the movement itself the cooperative organizations, including seventy to eighty million members in thirty-six countries, constitute a challenge to capitalistic enterprise run solely for profit and to

the claims for replacement of the latter by a political state. In spite of its compromises, its lack of revolutionary fervor, it remains a significant movement from within the rank and file of the producing class itself for self-help and self-development in various economic activities. What it has lost in comparison with the intensity of cooperative effort planned for Owen's “home colony of united interests” it has perhaps gained in an expansion of national and international scope.

ELSIE GLÜCK

BRITISH EMPIRE. *Consumers' Cooperation in Great Britain and Ireland.* Consumers' cooperation as a completely voluntary grouping unaided by philanthropy or the state had its origins in Great Britain and has attained a higher degree of development there than in any other country. The present movement dates back to the founding of the Rochdale Equitable Pioneers' Society in 1844, although in Great Britain as in other countries consumers' cooperative experiments, which have not been without influence upon later developments, preceded the Rochdale society. As early as 1767 through philanthropic efforts advances of money were made to the poor to build mills for grinding wheat or to finance bulk purchases of consumption needs. In 1769 a genuine friendly society in Scotland, the Fenwick Weavers' Society, agreed that funds of the society should be employed for the purchase of victuals to be sold for the benefit of its members, and other friendly societies were engaged in the purchase of wheat for their members. A vital impetus to the cooperative movement was undoubtedly given in the twenties by Robert Owen, despite the difficulty of disentangling consumers' cooperation from the other and wider objects of the collectivist societies which he and his followers advocated and the fact that he never formulated a step by step scheme for attaining consumers' control over industry. Another noteworthy influence was that of Dr. William King of Brighton, who saw the possibilities of expansion in the existing cooperative societies. His magazine, the *Cooperator*, founded in 1828, was widely read by working men and others seeking a way out of the social chaos of the time and influenced the establishment of many cooperative societies. Although during the thirties there were probably about 350 societies in existence, by 1844 most of them had failed. In some societies the provision that profits were to be used for the acquisition of land for the

setting up of communistic experiments made benefits too remote; in others the practise of distributing profits according to capital destroyed the cooperative principle; others were too small to be economical, were badly managed or were served by dishonest officials at a time when the law was not well adapted for collective trading organizations and property was vested in trustees.

The ideals of self-employment and the establishment of a "home colony of united interests," far from being absent from the minds of the Rochdale Pioneers, were probably the goals for which trading stores were to serve as the immediate mechanism and provider of capital. It is doubtful whether the Pioneers possessed the concept of a society based on the organization of consumption needs. The sound trading principles upon which their stores were founded, however, led to an unforeseen expansion and dominance of the distributive unit of cooperation, even though for many years the outstanding leaders of the cooperative movement—Hol-yoake, Neale and others—looked forward to the cooperative workshops for the attainment of the broader aims of social reconstruction.

The sound trading principles of the Rochdale Pioneers proceeded perhaps unintentionally from the broader aim of abolishing profit and establishing equality of status, although the distributive society was not recognized as the direct instrument of its operation. Thus the device of allowing but one vote to a member, irrespective of capital holding or trade, fulfils the latter aim. The practise of charging current local prices and then returning profits to consumers on the basis of their purchases—the introduction of which is attributed to Charles Howarth but which appeared earlier in the thought of the Owenite Alexander Campbell—might be cited as an example of the way in which the ordinary profit making mechanism can be used for the abolition of profit. Just weights and pure goods in trade and the realistic endowment of education and propaganda through a fixed percentage, usually 2.5 percent of surplus, reinforced the fundamental goals of cooperation.

The successful outcome of the initial application of these principles and practises led to the establishment in the fifties of many societies along similar lines, not necessarily possessed, however, of the fundamental ideology of the Rochdale Pioneers. The recognition of the necessity for special legislation to govern this new type of enterprise was embodied in the

Industrial and Provident Societies Act of 1852. This legislation as subsequently amended not only set forth provisions as to membership and limitation on share holdings but provided for public auditing by the registrar of friendly societies, permitted limited liability and exempted the societies from certain types of taxation applicable to ordinary commercial projects. By 1863 the English societies and by 1868 the Scottish societies had felt the need for establishing a wholesale organization for joint purchasing of commodities. In 1869 there was established the British Cooperative Union, a non-trading federation, which includes not only distributive but also producers', insurance and "special" cooperative societies as well as their respective federations and wholesales.

In this creation of national federations and of wholesale societies, as well as in the gradual undertaking by the wholesale organizations of production both in manufacturing and agriculture, the British movement set the precedent for consumers' cooperation in other countries. It is outstanding, however, in the rapidity and extensiveness of its development as manifested by its large membership and its unusually extensive trading and producing enterprises, in the establishment of international agencies for joint trading relations with the cooperatives of other countries, and is unique in the creation of a political body, the Cooperative party, founded in 1917 as a result of alleged discriminations against the consumers' societies, to send representatives to Parliament in order to protect its interests. This development was gradual and was based not so much on a theory of the role of the consumers' societies as on the creation of agencies to meet specific needs and emergencies as they arose. Only when in the course of this expansion the consumers' movement came into conflict with cooperative workshops on the one hand and with the trade unions representing its employees on the other, did a conscious social philosophy evolve, especially under the leadership of J. T. W. Mitchell, in which the economic organization of society through consumer control was visualized as a means of social transformation.

In 1901 the consumers' movement in Great Britain and Ireland had a membership of 1,783,489, or 4.3 percent of the total population; in 1929 the membership had risen to 6,168,994, or over 10 percent of the population, and represented the heads of between one half and one third of all of the families in Great Britain and

Ireland. In 1929 this membership was organized in 1234 local societies with a share capital amounting to £106,565,000 and a retail trade for the year of £216,967,000. The societies are grouped into two wholesales, the English Co-operative Wholesale Society, which at the end of 1929 included 1113 of the primary societies, and the Scottish Co-operative Wholesale Society, which included 253. The share capital of the former amounted to over £8,000,000, its loan capital (including its banking department) to £52,173,000 and its annual trade to over £90,000,000; the corresponding figures for the Scottish society were share capital £1,649,000, loan capital £6,465,000 and trade £18,352,766. The two wholesales united in 1923 into what is now known as the English and Scottish Joint Co-operative Wholesale Society, Ltd., for the purposes of jointly importing tea and operating tea plantations in Ceylon and India, for importing and manufacturing cocoa and chocolate and for directing the Co-operative Insurance Society, which had been established as an independent society in 1867. In 1929 the joint wholesale had a trade of £8,810,000 and the insurance co-operative had assets amounting to over £10,000,000.

Production in manufacturing and agriculture by consumers' organizations is carried on by the retail societies and their local federations and by the two wholesales and their joint body. Thus in 1929 the retail societies produced goods to the value of £36,806,000 and the two wholesales to the value of £37,139,000. The production of the joint wholesale was mainly carried on outside of Great Britain. These productive enterprises were mainly for the manufacture of textiles and clothing and the processing of food products. The wholesales, for example, represent the largest flour milling concern in Great Britain and account for perhaps one fifth of all wheat ground there. They also manufacture soap, furniture and machinery, and the English wholesale operates a coal mine, fruit and dairy farms in Great Britain and a wheat farm in Canada.

Although the British consumers' movement has established some agricultural productive enterprises it depends to a large measure of course on imports of foodstuffs from other countries. The British wholesales have played a significant part in the building up of cooperative relations with the Canadian, Scandinavian, Russian and Australian agricultural cooperatives. Its extensive banking transactions have led the English wholesale society to the establishment of its own banking department with head-

quarters in Manchester and branches elsewhere. This has served other cooperative organizations, trade unions and friendly societies as well.

These enterprises of the consumers' movement have made it a large employer of labor. In 1929 the retail societies employed 175,666 workers, the English wholesale 40,485 workers and the Scottish wholesale 10,459, a total of 226,610, almost double the number employed in 1913. The largest portion of these workers are in the distributive section of the societies and prior to the World War were but poorly organized into trade unions. Since the war, especially with the increasingly close relationship between the trade unions and the cooperatives, whose memberships are drawn from the same groups, trade unionism among cooperative employees has increased, until now about 70 percent of the workers in the consumers' cooperatives are organized. A trade union of cooperative administrative officials has also been formed. Because of the fact that the shop assistants of commercial enterprises are generally but poorly organized it has been difficult at times for the cooperatives to meet trade union demands and yet maintain themselves on a footing of competitive equality with their commercial rivals. Strikes of cooperative workers are infrequent, but in the coal strike of 1926 the cooperative mine was included. There is a tendency to ask the workers to look for their gains as consumers and members of the constituent societies rather than as producers, but generally speaking wage and hours standards are higher than in commercial undertakings, and the distributive societies were among the first to introduce minimum wage regulations. The cooperatives have also been of service to the general trade union movement in furnishing provisions to strikers during the great industrial conflicts in Dublin in 1913, in the railway strike of 1919 and the miners' lockout of 1920.

The central federation of all cooperative societies in Great Britain is the British Co-operative Union, founded in 1869, which exists for advisory, propaganda and educational purposes and which bears much the same relation to its constituent societies as the British Trade Union Congress does to its member unions; it is controlled by an annual congress. Although it includes productive, supply and special cooperative societies, the distributive societies probably account for almost 98 percent of the membership. Under the direction of the union and in cooperation with the local societies educational activities were endowed to the extent of

£236,685 in 1929, enrolled 50,000 students and were of three types: technical for employees and officials, academic for active workers and general for the rank and file. In 1919 a Cooperative College was established in Manchester. The union also carries on extensive printing and publishing enterprises. It is with the union also that the women's and men's cooperative guilds and other semi-autonomous bodies are affiliated. The Women's Cooperative Guild, founded in 1883, numbered in 1929 almost 65,000 members. It is represented on the central board of the wholesale and on other bodies. It has been one of the most stimulating sources within the movement for the emphasis on the broader aspects of the movement, such as the labor problem, child welfare, peace propaganda, housing problems and the like, and is represented on the governing board of the Cooperative Union. Similarly affiliated also is the Cooperative party, which although organized on a voluntary basis only in 1917 includes almost half of the total membership of the societies and has nine representatives in Parliament, one of whom is a member of the Labour government. In Parliament these representatives have fought legislation leading to restraint of trade, have advocated amendments to the industrial and provident acts, have attempted to strengthen government regulation in auditing of business accounts, in pure food legislation and the like. The Cooperative party has on the whole harmonious relations with the Labour party, with which it has a non-competitive working arrangement. The consumers' societies and their wholesales and the union are all affiliated internationally with the International Cooperative Alliance.

Rapid as has been the growth of the consumers' cooperative movement it has before it the considerable task of arousing a greater degree of participation from its membership. The unusually large membership of single societies in Great Britain makes participation in self-government especially difficult. On the whole a comparatively small percentage of the member's income is spent in his cooperative store. On the other hand, the movement is more and more developing a literature and philosophy of its own, in which the underlying principles and practices of consumers' cooperation are conceived as being applicable to the production and distribution of all types of consumption needs. Affiliated bodies such as the Cooperative party, the Cooperative College and the Women's Cooperative Guild have done much to bring out

these broader implications of consumers' cooperation.

FRED HALL

Agricultural Cooperation Agricultural cooperation is as typical of the British overseas dominions and colonies as consumers' cooperation is of highly industrialized England. Generally it takes the form of cooperative marketing, most often for export purposes. In 1920 the principal marketing cooperatives of Australia, New Zealand and South Africa formed the Overseas Farmers' Co-operative Federations, Ltd., with offices in London. In 1929 its annual turnover was more than £9,000,000. It maintains friendly trading relations with the consumers' Cooperative Wholesale Society in England. Dairying cooperatives sprang up spontaneously in several dominions and in Ireland during the eighties and nineties of the last century. The sale of agricultural requirements is subsidiary except in England. In all of the countries concerned rapid development did not begin until 1900 and is still continuing. In tropical areas like Ceylon (with a cooperative membership of about 27,000) and Malaya, credit cooperation was the first form and is still predominant, although there is some tendency to introduce marketing organization. In the West Indies, however, notably in Jamaica, where banana exporting is important, marketing cooperatives have taken precedence over the credit unit.

The movement in England today, although not numerically imposing, includes about one fifth of all farmers. As early as 1867 Edward O. Greening, a leader in the general cooperative movement, founded a requirements society which appears to have been the pioneer of British agricultural cooperation. The Agricultural Organisation Society promoted the formation of societies from 1900 until its dissolution because of financial weakness in 1924. At present there is no central body. In 1930 there existed 230 societies with a membership of 67,526 and an annual turnover of nearly £10,000,000. Slightly less than half the societies, including many of the larger ones, are engaged in the sale of agricultural requirements, and to some extent they purchase members' grain. Nearly all the remainder are marketing societies, handling mainly dairy produce and to a lesser extent meats, livestock, wool, eggs or fruit. Hop marketing was attempted but failed. Despite difficulties in the post-war period these societies are now firmly established. The move-

ment in Wales closely resembles that in England, but the societies chiefly for geographical reasons are smaller and are more exclusively occupied with the supply of requirements. There are 92 societies affiliated with the Welsh Agricultural Organisation Society, which gives advice and undertakes propaganda. Both the English and the Welsh agricultural cooperatives through the encouragement of the agricultural department of the British Cooperative Union have established cooperative relations with the wholesale society of the consumers' movement, which in turn extends them credit facilities.

The movement in Scotland is distinct from that in England and in Wales. At the present time there are somewhat over 200 societies with a membership of about 15,000, all affiliated with the Scottish Agricultural Organisation Society, which has supervised the development of the movement since 1905. Nearly two thirds of these societies are situated in the highlands and islands and are on a very small scale. They include societies for the supply of agricultural and domestic requirements, for stock breeding and for the sale of eggs. The remaining societies are in the lowlands and on a larger scale, similar to that of the English societies. Supply of requirements is less prominent than in England, however, and amounts to only about £500,000. The most important business is the sale of dairy produce, in which over 60 societies are engaged; next in importance is the sale of wool, which is centralized in a single society, followed by the sale of meat and eggs. In 1927 the Scottish Milk Agency was formed to make a collective contract on behalf of its members for the sale of milk to retailers and to arrange for the disposal of surplus to cooperative creameries. It includes a large majority of the milk producers of the west of Scotland and Aberdeen and has an annual turnover in the neighborhood of £1,000,000. It maintains trading relations with the Scottish consumers' wholesale society. The turnover of other marketing operations is comparatively small.

The Irish movement dates from the formation of the Irish Agricultural Organisation Society in 1894 under the leadership of Sir Horace Plunkett, R. A. Anderson, Lord Montague and Father Finlay. In its first years many types of society—requirements, general purposes, credit and marketing—were set up, but although other varieties survive, dairy cooperation predominates today. Of about 500 societies with a membership of about 100,000 there are

274 dairy societies. In recent years they have been assisted by the action of the Free State government in buying out proprietary creameries and so creating a cooperative monopoly. During the last few years the majority of creameries have sold through a single cooperative exporting agency, which it is now proposed to reorganize as a national body. Dairies make loans to their members and tend to supplant specialized credit societies in their work. A centralized wholesale for the supply of requirements, the Irish Agricultural Wholesale Society, includes about 475 societies. The political division of the country into the Free State and Northern Ireland made necessary the formation of a separate center, the Ulster Organisation Society, in 1922.

Among the overseas dominions and colonies (excluding India, Canada and Palestine) South Africa shows the fullest development of state aid for agricultural cooperation in legislation and finance. A few marketing societies were started as early as 1905 after the first agricultural cooperative legislation, but rapid progress dates from the passage of the Cooperative Act of 1922. There are now 442 societies with a membership of 62,577. Most of them deal in requirements, but the larger societies are engaged in marketing, the principal commodities being, in order of importance, wool, wine, tobacco, maize, wheat, dairy produce, cotton, sugar cane, poultry, fruit. The local societies are in most cases organized in central commodity organizations (pools), which in turn are linked in the Federated Farmers' Cooperative Association of South Africa, formed in 1923 with 66 societies and a membership of 75,000, which supplies requirements and arranges the transference of produce for export to the Overseas Farmers' Cooperative Federations. The pools obtain loans from the Land Bank to make advance payments for produce to their members. The act makes it possible for marketing through a pool to be made compulsory when 75 percent of the producers, controlling 75 percent of the total product, are already members of cooperative societies; this has been done in the cases of tobacco and wine. The total turnover of marketing societies is about £10,000,000 and of requirements societies about £1,000,000.

Australian cooperation varies considerably from state to state. In Western Australia self-governing affiliated societies are served by the Westralian Farmers, founded in 1914, with 70 societies and 8000 members, which supplies requirements, markets wheat and performs other

wholesale services. The societies are also affiliated in a Cooperative Federation of Western Australia, which in addition to other services broadcasts through its own radio service current market prices. In South Australia the movement is centralized and is also concerned mainly with requirements and marketing on a smaller scale. Victoria was the pioneer of cooperative dairying societies now grouped in three federations, besides being the headquarters of the Australian Producers' Federation, which constitutes the link between its eleven affiliated cooperatives and the Overseas Farmers' Cooperative Federations. Queensland has initiated a system of compulsory marketing pools on cooperative lines, which covers a variety of produce; this system is being tried in New South Wales, where the cooperative handling of produce on voluntary lines has been in progress for some years. Co-operative activity in Tasmania is in its early stages but is making rapid progress. The total number of Australian agricultural societies is about 249, with 120,000 members.

In New Zealand agricultural cooperation is almost exclusively concerned with dairying and controls 80 percent of the total production but a considerably smaller percentage of the total exports of butter and cheese. The movement dates from 1890 and there are now about 250 dairies with a total membership of about 62,000. For export purposes they use either the New Zealand Producers' Association, which works in partnership with the English Cooperative Wholesale Society, or the Amalgamated Dairies, a joint stock company. The Producers' Association also imports requirements and dairy machinery. There are also exporting societies dealing in frozen meat and other commodities.

MARGARET DIGBY

Cooperation in India. Cooperation in India is chiefly confined to credit functions and with the exception of a few urban societies is rural. "Rural" India, however, comprises about 90 percent of the population, to be found in the 500,000 villages, still to a great extent self-sufficing, where it ekes out a bare subsistence. More than 73 percent of India's population is directly dependent upon agriculture. The significance of the cooperative movement is to be judged in terms of the magnitude of the problem of rural reconstruction in India. Although the Indian land systems are varied and complicated, by far the greater part of the land is cultivated by peasant tenants or owners in small and often

scattered holdings. Pressure on the soil from the unusually high density of population (six to seven times that of the United States) has not yet been relieved either by any decline in the fertility of the population or by any marked tendency toward industrialization. Moreover, rural by-industries such as stock and dairy farming are either woefully neglected or are conducted by the non-agricultural handicraft castes. The improvements introduced in some areas by official efforts are partly counterbalanced elsewhere by a tendency toward exhaustion of the soil owing to customs such as that of the burning of dung cakes as domestic fuel, which starves the land of its natural manure, or toward a deterioration in cultivation resulting from the crushing burden of indebtedness. The cooperative movement strikes most effectively at the problem of indebtedness.

Indebtedness has been a feature of Indian life throughout the centuries. Peasant cultivators (ryots) have been forced to borrow from the village grain dealer (*banias*) and money lenders (*sahukars*), who also make advances to both rural and urban artisans in order to enable them to continue to produce. Borrowing for ceremonial purposes or to pay for litigation has also been a widespread practise. Increased political and economic security and increased total productivity during the period of British rule have tended to aggravate the problem partly because of increased population and partly because of the increase in both the demand and facilities for borrowing. The improvement of methods of cultivation requires capital; the increased value of land and more certain legal recovery increase the security that the ryot can offer. Increased indebtedness is thus not necessarily a sign of increased poverty; the poorest cannot and do not borrow. Indebtedness, however, is neither more prevalent nor heavier in India than in the West, but it has exceptionally disastrous consequences because of the unproductive nature and permanence of most debts. The high rates charged by money lenders, ranging from 30 to 60 percent in rural areas to as high as 100 or 200 percent in urban areas, render repayment almost impossible. Many ryots and artisans fall permanently into the clutches of the money lenders. In the case of the ryots the creditors do not usually take actual possession of their land but prefer to keep them in permanent subjection. Since factory operatives do not usually receive wages until they have been at work for several weeks they too are almost invariably in debt.

Attempts even before the British era to remedy these evils by furnishing *takavi* (state) loans and through laws against usury met with small success. Such legislation was not widely understood, and those most in need of credit had no security to offer. The failure of these efforts, the increasing urgency of the problem and the adoption by the government of a new attitude of responsibility for the welfare of the masses led at the end of the nineteenth century to a series of official inquiries and to a study of European methods.

The recommendations of a committee appointed in 1903 formed the basis of the Co-operative Credit Societies Act of 1904. This act provided for the founding of cooperative credit societies classed as rural or urban. The former were modeled on the German Raiffeisen banks, with unlimited liability and unpaid secretaries. The latter usually had limited liability and paid secretaries. Apart from a minority of societies with profit earning shares any idea of exclusiveness or profit was prevented by the allocation of any surplus earned to a reserve fund on an indivisible basis. A peculiar feature of the system was the appointment in each province of a registrar of cooperative societies, whose duty it is to organize and supervise the societies with the assistance of various subordinate officials. But except for a few minor financial concessions and loans subsequently repayable no actual financial aid was given by the government, a procedure recommended by students of credit cooperation.

The act laid down general principles only, leaving each province to issue its own rules and regulations. For instance, although regular audit is a statutory obligation, the method of audit varies. A primary credit society can be formed by not less than ten members, who select their own managing committee (*panchayat*) and secretary, draw up by-laws and then register the society. Capital is obtained from members and non-members' deposits, loans, accumulated reserves and occasionally from shares.

By 1911, 8177 societies with 403,318 members existed. The Act of 1912 authorized the formation of societies for purposes other than extension of credit and provided for the formation of unions of primary societies, of central banks and of coordinating associations, improvements which had been much needed. The former classification into rural and urban societies was dropped, and the new basis was according to the nature of the liability, but most rural societies retain unlimited liability. At about the same

time loans, which had been originally granted only for productive purposes, were extended to include the expenses of cultivation or production, capital expenditure, the payment of land revenue, holding out for a better market, ceremonial expenses, repayment of old debts, redemption of mortgage and expenses of litigation.

Many new types of societies sprang up after 1912. In rural areas societies have been formed to purchase seeds, manures, implements and the like, to sell produce, to undertake the preparation of dairy, rice and cotton products, and for other purposes, such as the consolidation of holdings (a form very successful in the Punjab), irrigation, supply of bulls for breeding purposes and cattle insurance. In urban areas weavers, carpenters and other artisans have formed societies, usually for purchase or sale, and attempts, unsuccessful on the whole, have been made to establish consumers' societies. In both rural and urban areas societies have been founded for many miscellaneous purposes, such as thrift, housing, education, arbitration and public health. Some societies undertake more than one type of function. Although in general the idea has been to prevent caste exclusiveness, a considerable number of special societies have been organized among the depressed classes and hill tribes.

A number of federated unions and central institutions have also been established since 1912. Central banks, of which in 1927-28 there were 598 in India as a whole and 503 in British India, have been formed, usually by groups of public spirited men, who contribute share capital and business ability. These have won public confidence and attract deposits from non-members—partly, it is said, because of the erroneous idea that they are guaranteed by the government. In most provinces there is also a coordinating "apex" bank. Both the provincial and central banks have commercial dealings with the Imperial Bank of India, founded in 1921. Finally, there are a number of provincial central cooperative institutions, such as the Bombay Cooperative Institute and the Punjab Cooperative Union, which undertake propaganda and other work. In 1929 there was formed an All-Indian Provincial Cooperative Institutes' Association.

As a result of the report of a special committee in 1915, which pointed out the danger of permitting unauthorized overdues to increase, and the tendency on the part of many societies to depart from cooperative principles considerable re-

organization took place. The movement has on the whole progressed steadily. In 1927-28 there were in India as a whole 66,091 societies, with 3,780,173 members of primary societies and a working capital of 76.7 crores of rupees, equivalent to £57,525,000. British India accounted for 85 percent of the societies and membership and for over 90 percent of the working capital. No less than 83,250 of the societies were primary credit institutions. A recent estimate places the number of societies in 1930 at 110,000, with 4,500,000 members and a working capital of 100 crores of rupees, or £75,000,000.

Under the constitutional reforms of 1919 co-operation became a provincial "transferred subject," and two provinces, Bombay in 1925 and Burma in 1927, have already exercised their power of passing special provincial legislation. Unfortunately the transference of cooperation to ministers responsible to the provincial legislature has not yet given any great impetus to the co-operative movement because of financial stringency, which has acted as a severe brake on the promotion of so-called nation building projects.

The Royal Commission on Agriculture in India of 1928, in emphasizing the need for the education of both members and officials in co-operative principles, concluded that it was essential to retain official supervision and control. It pointed out the dangers arising from the grant of long term loans by ordinary credit societies depending mainly on short term funds and recommended the organization of special land mortgage banks, a number of which have subsequently been established under the existing co-operative law.

Despite its undoubted success in certain spheres and areas the co-operative movement is not yet on a thoroughly secure footing. Numbers and membership may continue to increase, although certain societies do little work and others are operating on an unsound financial basis or on a non-co-operative basis. Particularly dangerous are the accumulation of overdue, the creation of fictitious repayments and new loans, the fairly frequent embezzlement of funds by officials and the control of primary societies by money lenders in some areas. This necessitates the continuance despite theoretical objections as to its paternalistic nature of government control and initiative.

Recognition of these facts has led to inquiries in one province after another. Reorganization, undertaken in the Punjab after 1915 and more recently in most of the major British provinces

and in some Indian states involved the liquidation of many societies and the placing on probation of others. The situation is still very unsatisfactory in the Central and United Provinces and in Burma. The movement is strongest in the Punjab, Bombay and Madras, among the British Indian provinces and in the Indian states of Travancore, Bhopal, Gwalior and Mysore. Elsewhere only a very small proportion of the population has yet been brought into contact with the movement. Even when reorganization has been completed and extended to all areas, strict official supervision will have to be maintained for many years, and a real effort is necessary to maintain the standard and to improve the training of members, officials and the general public. Such effort has thus far been systematically put forward only in the Punjab and in Bombay.

Much depends on the personal and technical qualifications of the registrar and his staff. At the present time the staff is not sufficiently large and depends on assistance given by honorary voluntary workers, whose training is insufficient or who cannot devote the necessary time and energy to their duties.

Nevertheless, the movement already has immense achievements to its credit. Members' debts have been consolidated and sometimes completely repaid; the prevailing rate of interest has been reduced not only for members, who benefit from the average cooperative charge of about 12 percent, but also for whole districts where cooperation is strong; permanent improvements in the land and improved methods of cultivation have been introduced; a new spirit of independence has been instilled into the minds of the peasantry; a training has been given in thrift and financial principles and the movement has proved of immense educational value. Beginning with the limited objects of relieving the masses from a crushing burden of debt and providing capital on reasonable terms, the movement has proved the best means of preparing the way for the expert, whether educational, agricultural, veterinary or medical, and of bringing him into direct contact with the daily life of the masses. This latter object has already been promoted by close cooperation between the co-operative and other nation building departments, and the work could be greatly accelerated if a system of rural broadcasting were adopted by the newly constituted Indian Broadcasting Board.

VERA ANSTEY

Cooperation in Palestine. The cooperative movement in Palestine is with the exception of a few German societies almost entirely Jewish. Although the movement includes only about 40,000 members altogether it is unique in the extent to which it has pervaded the population of a recently colonized country. At the present time one out of every five of the Jewish population of Palestine is a member of a cooperative.

Cooperative endeavor antedates the British mandate. The Anglo-Palestine Company, Ltd., and the Palestine Jewish Colonization Association were responsible for the existence of about twenty cooperative societies prior to 1920. During this period two of the most powerful marketing cooperatives were established: in 1896 the association which is now responsible for 90 percent of the wine grape production and in 1900 an orange marketing association which disposes of 40 percent of the crop produced by Jewish farmers. These organizations had no legal status, however, under Ottoman law, and the Cooperative Societies Ordinance of 1920 was one of the first enacted by the British civil government.

During the entire period of Jewish colonization there has been a fusing of the aims of colonization and of cooperation. This has accounted in part for the failure of two of the largest cooperatives. Out of this identification have arisen certain departures from cooperative practise. Since Palestine is considered a potential home for all Jewry, the cooperatives admit absentee members. Prospective settlers organize abroad for cooperative purchase and development of the land. Everywhere cooperative forms have been adapted to suit the needs of "a country in the making." Certain groups stressed the cooperative basis of community life as an application of the underlying social principles of Biblical times; the labor groups emphasized cooperative endeavor. The form which some of these colonies have taken can be more accurately described as collective farming.

At the present time the 284 organizations serve ninety centers. In November, 1930, the 208 most active organizations had a total share and reserve capital of about \$2,000,000, deposits and savings of about \$3,120,000, mutual liability of the members of about \$4,500,000; the indebtedness of the members to the societies is about \$1,500,000 and the total indebtedness of the societies to banks and other institutions (other than depositors) is about \$1,750,000. Of the total of 284 societies the largest single group

are the land purchasing and building cooperatives, which number eighty-five. There are sixty-two credit societies; and it is interesting to note that the credit society, most typical of Jewish cooperative effort in the Diaspora, does not assume the same significance in Palestine. Agricultural cooperatives for marketing, dairying, cattle insurance, irrigation and the like account for 53 societies and market 90 percent of the almonds, wine grapes and dairy products produced by Jewish farmers. During 1929-30 their sales amounted to \$2,500,000, of which \$1,500,000 is represented by exports. Industrial producers' cooperatives, including not only combinations of workers for production but groups undertaking collective labor contracts, number 41 societies, which in the last year manufactured and sold goods for about \$450,000. There are 30 *kvutsoth*, or collective farm cooperatives, and 13 societies of miscellaneous types. It is premature to state whether life in Palestine, where it is hoped to diminish the role of the Jewish trader, will be more favorable for the propagation of consumers' cooperation than it has been in the Diaspora.

The cooperative societies have not received any financial aid from the government; but the two central institutions and a few of the cooperatives have been assisted in their initial stages with interest free or low interest loans or subscription to share capital from social economic institutions and individuals abroad interested in the development of Jewish Palestine. Central institutions have been organized for the purpose of financing and organizing cooperatives and have thus preceded local groups rather than been built up by them.

There is as yet no comprehensive organization of all the cooperatives in Palestine. This is due, perhaps, to existing differences of opinion as to ends; for instance, cooperatives of labor origin or sympathies accept only members of the General Federation of Labor, and in certain instances this organization exercises veto rights. There is, however, a movement toward union and a realization that cooperative effort is necessary in order to overcome existing physical and economic hardships in the development of the country.

HARRY VITELES

GERMANY AND AUSTRIA. *Consumers' Cooperation.* The first consumers' cooperatives in Germany, developed as part of the Schulze-Deletzsch general cooperative movement in the

sixties, achieved no great significance. The membership of this movement was chiefly middle class, interested in the credit aspect; the working class, still unorganized but under the domination of socialist leaders who were antagonistic to the middle class character of the movement, held aloof. Lassalle, whose influence among the masses was great during this period, found consumers' cooperation futile, basing his opposition on the iron law of wages. Consumers' cooperation among the working masses received its first impetus in the eighties in Saxony, then the most industrialized of German states, partly because the antisocialist law of 1879 made trade union or socialist organization impossible. As a result of highly accelerated industrialization in the nineties and the cooperative law of 1889 permitting limited liability the consumers' movement grew rapidly. The consumers' societies remained united with the Schulze-Delitzsch Allgemeiner Verband der Deutschen Erwerbs- und Wirtschafts-genossenschaften until they were expelled by that body in 1902.

The growth of the movement in the nineties was interrelated with the rapid urbanization and increased unionization of the working classes and with a change in the socialist attitude toward cooperation. Although at all times two thirds or more of the membership were working class and the greater proportion of these were affiliated with social democratic labor unions, the value of consumers' cooperatives to the workers was not officially recognized by the Social Democratic party until about 1910. The consumers' movement itself emphasized its political neutrality, but its essential difference from the middle class credit movement led inevitably to the separation in 1902 from the Allgemeiner Verband.

Consumers' cooperation as an independent movement thus can be traced to the founding in 1903 of the Zentralverband Deutscher Konsumvereine, which because of the location of its central purchasing body was known as the Hamburg movement. Within two years this union had absorbed a majority of the consumers' unions of the Allgemeiner Verband and included over half a million members in some five hundred societies. In spirit and structure the Hamburg movement is more closely allied to the British Rochdale societies than to its Schulze-Delitzsch progenitor.

The rapid progress of the movement in enlarging its membership, in its concentration of the number of societies, in the degree of affiliation with the national federation, in the setting

up of a powerful wholesale and in the extension of its scope by the assumption of productive functions closely parallels the British consumers' movement. In Germany it is one of the largest commercial and industrial enterprises. In the international cooperative movement and as a member of the International Cooperative Alliance the German societies form the third largest group of consumers' organizations, out-ranked only by Russia and by Great Britain. The movement has been rich in practical leadership both nationally and in the international organization. Its actual economic transactions with the cooperatives of other countries, however, have always been limited.

The war and post-war growth has been steady. Although the consumers' cooperatives in Germany were not utilized during the war by the government to the same extent that they were in Austria and France, the public authorities ceased to prohibit membership to public employees. The societies have successfully weathered the depressed economic condition of Germany since that time, and in 1929 the Zentralverband included almost 3,000,000 members in about 1000 societies. It controlled over 350 central regional warehouses and over 10,000 stores, with an annual turnover of 1,200,000,000 marks, of which over 280,000,000 marks are represented by the products of its own bakeries and meat packing houses. The wholesale purchasing society of the Zentralverband has an annual turnover of 500,000,000 marks, of which one quarter is represented by its own products. Almost 65,000 persons are employed by the societies and the central warehouse, and the problem of industrial relations which has naturally arisen and which has caused some difficulties has resulted in the establishment of collective bargaining relations with the trade unions and the representation of the workers on management boards. The German societies have introduced a program of general education in cooperative ideals for its membership through the press and have provided special training for its executives and staff through a central school at Hamburg and classes in the societies. No progress has been made in the development of women's guilds such as those found in the cooperative movements of Great Britain.

In addition to the Zentralverband a separate organization of the consumers' societies closely connected with the Christian Labor movement in the Catholic Rhine region and known as the Verband Westdeutscher Konsumvereine was

founded in 1908. In 1913 this organization absorbed the consumers' societies of government employees and became known as the Reichsverband Deutscher Konsumvereine. The Reichsverband includes about 275 societies with a membership of almost 750,000, controlling over 2000 stores and with a turnover of almost 200,000,000 marks. Its wholesale purchasing society, Grosseinkaufsgesellschaft des Reichsverbandes ("Gepag"), has a turnover of over 72,500,000 marks, of which 10,000,000 marks are represented by its own products.

The consumers' cooperative movement in Austria prior to the World War followed the German movement in its external features but developed far less rapidly because of the lower degree of industrialization and the conflict of nationalities, which led to the formation of nationalistic societies, as well as because of the close alliance between the German speaking societies and the Social Democratic party. The movement was thus split into minority nationalistic groups, neutral, Catholic and social democratic organizations. During the World War and the period of reconstruction the four competing cooperative organizations of Vienna were merged and played an important part in the feeding of the population. After the war the establishment of new cooperatives was resumed with great zeal, and for a time it appeared that these were to form the kernel of a general socialistic reconstruction of the commonwealth. The Union of German Austrian Consumers' Societies, which in 1913 claimed about 150,000 members, had a membership of about twice that number in 1926; the stores tripled from 299 in 1913 to almost 900 in 1926. Its wholesale society undertakes some production. The consumers' societies, aided by the labor unions, formed a cooperative bank in Vienna in 1923, which despite the economic depression has made steady gains. The organization, whose membership is largely working class and the center of whose activities is in Vienna, is affiliated with the International Cooperative Alliance.

THEODOR CASSAU

Credit Cooperation. Both historically and functionally it is difficult to separate the credit cooperatives from other types of cooperative endeavor in Germany. There as in other European countries cooperation developed as one result of the general social and economic disturbances which reached a critical stage in 1848. The pioneers of cooperation in all these coun-

tries included in their plans every type of co-operative activity, and only later were the separate forms developed. In England and France cooperation evolved as part of the program of pre-Marxian and Christian Socialism. In Germany, then in a period of rapid commercial and industrial expansion, the impulse came, however, from the liberal bourgeoisie, and the socialists under the influence of Lassalle opposed the movement. Through the philanthropic endeavor of the liberal bourgeoisie welfare associations were founded through which funds were advanced for the purchase of the necessities of life and of commodities for trade and production in the hope that the members of the lower middle and working classes might thus be encouraged to thrift and self-sufficiency. Out of these associations there developed, on the one hand, savings and loan institutions and, on the other hand, the credit cooperative movement, which for forty years was the predominant cooperative form and which in Germany was also the cradle of the consumers' movement.

The transition from philanthropy to the self-supporting credit cooperative was effected through the efforts of a liberal statesman, Hermann Schulze-Delitzsch (1808-83), who was interested in all forms of cooperation and was sympathetic with all group efforts for self-help, such as trade unions and friendly societies. For many years until 1902 the Allgemeiner Verband der Deutschen Erwerbs- und Wirtschaftsgenossenschaften, founded by him in 1859, included consumers' as well as producers' and credit cooperatives. In 1920 it combined with another cooperative union, the Hauptverband Gewerblicher Genossenschaften, which was founded in 1900 and assumed the name of Deutscher Genossenschaftsverband. Schulze-Delitzsch and his followers have at all times strongly opposed state aid of any sort, thus bringing upon the Schulze-Delitzsch societies the strong enmity of the government. Nevertheless, it was through him that favorable cooperative legislation was enacted, first in Prussia in 1867 and later throughout the nation in the imperial law of 1889.

The rural credit movement was begun in 1862 by F. W. Raiffeisen (1818-88), a *Landburgermeister* in a Rhineland village, who like Schulze-Delitzsch had experimented with semiphilanthropic loan and provision societies from 1848 to 1850. It can really be considered an offshoot of the Schulze-Delitzsch plan. The differences in the plans, which found expression in provisions

as to liability, size of shares, territorial scope and the like, arose primarily out of the attempt to make the credit cooperative adaptable to the small landholders of southwest Germany; the strongly religious nature of the movement reflected the moral purpose of its founder and had a practical basis as well. In the Raiffeisen societies and in the rural credit cooperative movement initiated in the eighties under the leadership of Wilhelm Haas (1839-1914) the credit functions were combined either directly or in an allied body with marketing, purchasing, storing and processing functions, which in countries other than Germany have led to the formation of special types of agricultural and marketing cooperatives. The rural cooperatives have done much to introduce the use of electric power and light into rural communities; about 6100 such special cooperative societies existed in 1927. In the small Raiffeisen societies, each limited to a parish, all these functions except dairying were usually performed by a single society; in the larger and more prosperous units of the Haas organization separate societies were formed. Rural credit cooperation in Germany therefore includes an unusually large number of activities.

The distinctions between the Schulze-Delitzsch, Raiffeisen and Haas societies, although the cause of much controversy in their pioneer period and of historical interest in the development of doctrines and practises, have proved to be of less significance for theory because they obviously arose out of special needs.

The Schulze-Delitzsch societies have on the whole been of service to the town population and are known as urban credit cooperatives. Nevertheless, in 1906 the Allgemeiner Verband recruited a quarter of its membership from farmers and gardeners. Although this percentage has been a decreasing one it still represents the largest single occupational grouping in the Verband. The other occupational groupings include skilled handicraftsmen, who composed in 1906 about 24 percent of the membership, shopkeepers and tradesmen, who represent about 10 percent, wage earners, who represent about 13.5 percent, professional persons and rentiers, who represent about 15.5 percent. Since 1890 the percentage of membership belonging to the last three groups has increased at the expense of the first two groups.

Each Schulze-Delitzsch society is usually administered by a board of three persons who also act as its chief officers, subject to control by

somewhat larger bodies. Membership is based on the purchase of one share and, where liability is unlimited, one share only; the value of the share is made sufficiently high to provide capital and to encourage thrift and is payable in small instalments. Additional capital is furnished by deposits of non-members as well as members, drawing accounts, loans from commercial banks or loan associations and rediscounts of bills of exchange. About 20 percent of the profits are placed in a reserve fund, to which are also usually added entrance fees and the entire profits of the first year or so of operation; the remainder of the profits are distributed to shareholders. Not all shareholders are borrowers, and in the urban credit cooperative only about 60 percent of the members avail themselves of the credit facilities. Loans are restricted to members on interest rates which, although somewhat lower than current rates, have never fallen dangerously below market rates. Although at one time the Schulze-Delitzsch societies had their own central banking institution, it was soon abandoned for clearing transactions with the Bank of Dresden, which created a special cooperative department. This reliance upon ordinary commercial banks was warranted by the frequent use of the trade bill of exchange, a commercially marketable paper. Moreover, the hostility of these societies to state aid has militated against their use of the Preussische Zentralgenossenschaftskasse, popularly known as the Preussen-Kasse, which was established by Prussia in 1895 to serve as a state credit institution for middle class cooperatives.

The growth of the Schulze-Delitzsch societies is described by the following statistical data: in 1859 there were 80 societies with about 19,000 members; by 1905 their number had grown to 1020 with 587,000 members; and on July 1, 1930, the Deutscher Genossenschaftsverband included 1351 urban credit cooperatives. The 1257 reporting societies had a membership of 1,008,540; their capital amounted to 1,792,570,000 marks, of which 304,570,000 marks were owned by them. Over four fifths of the assets are invested in short term credits to members, mostly in the form of current accounts. Most of the loans are in amounts of from 200 to 500 marks.

The typical Raiffeisen society, modeled on the founder's experiment in Anhausen, differs from the urban cooperative in several ways: it is confined to a single village or parish; membership is based on good character as well as on need.

Originally there was no subscribed capital but universal unlimited liability of the members; nevertheless, since the law of 1889 requires division of capital into shares, the Raiffeisen society has complied by issuing nominal shares of ten marks, although no dividend is declared. All profits remain the collective property of the society and are placed in two reserve funds, one of which is a reserve fund proper and the other an indivisible *Stiftungsfond* used for positive improvements. The only direct profit gained by the members is in the occasional lowering of loan charges and increase in interest allowed on deposits, both of which are lower than in the urban cooperatives. Capital is derived entirely from savings and deposits, usually of members although occasionally of non-members as well. The limitation of membership to a village makes the banking institution itself quite simple, and it is generally administered by one person, the only paid officer of the society. The policy of the society is usually determined by an honorary board of directors.

In 1929 the Raiffeisen societies numbered 8252 with a membership of 800,000. The organization, later known as the Generalverband der Deutschen Raiffeisen Genossenschaften, which was founded in 1877 for educational and advisory purposes and functioned mainly in the southwest, had in 1929 an affiliation of 5799 of these societies with a membership of 520,000. A centralized institution for supply and marketing subsidiary to the general association, known as the Wirtschaftsverband der Raiffeisenschen Warenanstalten, was founded in 1915; in 1922 it had a membership of 4460 societies. Until its failure after the war the Landwirtschaftliche Zentraldarlehenskasse für Deutschland, later known as the Deutsche Raiffeisenbank, served as a central bank for these societies. It was a highly centralized organization, to which the provincial banks were subordinated far more than has been true in the Schulze-Delitzsch and Haas institutions. The Zentraldarlehenskasse, which for many years was centrally located in Neuwied, Prussia, finally accepted the aid of the Preussen-Kasse. It has therefore been charged with accepting state aid, although the Preussen-Kasse operated on a non-philanthropic basis, merely furnishing credit at a low rate of interest. It is true, however, that the Raiffeisen societies have received encouragement from the state and because of their religious character have enjoyed the support of the clergy of all denominations.

A far more powerful rural federation than that of the Raiffeisen societies was the Reichsverband der Deutschen Landwirtschaftlichen Genossenschaften, founded by Wilhelm Haas. The Haas societies represent an attempt to return to Schulze-Delitzsch principles as to size of shares, capital, provincial decentralization and the like; they have appealed on the whole to a more prosperous group among the farmers. In 1929 the Reichsverband included 26,170 societies with a membership of about 2,500,000, a number three times as large as that of the Raiffeisen societies: the business turnover was probably six or seven times as large. The working capital per local bank of the Haas societies amounted in 1927 to 101,242 marks, or 934 per member. These figures are far below the pre-war standards because of property losses, not yet restored, which were incurred by the inflation. Thus the savings deposits of the same group, amounting in 1913 to 147,077 marks per society while in 1927 they were only 45,050 marks. The Haas societies are federated into provincial units, all of which were until recently clearing through the Reichsgenossenschaftsbank, an organization created by the Reichsverband on the basis of share capital without government aid. In addition the Reichsverband utilized also the Preussen-Kasse for its cooperatives. The agricultural societies need of a centralized bank to act as an equalizer between the various districts has obviously been greater than that of the urban credit cooperatives.

For many years the two rural cooperative federations of Raiffeisen and Haas societies were rivals, but in 1930, not without some pressure from the state and state aid, they were merged. At the same time some smaller farm federations joined them, the whole being named the Reichsverband Deutscher Landwirtschaftlicher Genossenschaften-Raiffeisen and including 90 per cent of all the farm cooperatives of Germany. Of the total of 36,400 societies with a membership of 4,000,000, 19,749 are credit cooperatives or savings and loan associations. The 17,870 credit cooperatives reporting in 1928 had a membership of 1,984,538 with membership shares amounting in the aggregate to 61,290,112 marks; at the end of the year they had 1,531,011,707 marks in outstanding credits. The societies are small, averaging usually about 100 members; the liability is in most cases unlimited.

The separate banks of the two rural federations have now disappeared after considerable

losses due to bad management. The Preussen-Kasse has become the central banking institution for the German cooperatives, a position which it has retained undisputed since the liquidation of the Raiffeisen bank. Meanwhile the German government itself has become a partner in its affairs; the significance of this participation lies in the fact that the post-war shortage of capital in Germany, felt by the credit societies as well as other cooperatives, can be relieved only by state aid. The Preussen-Kasse today is after manifold transformations a joint stock company whose shares are in the hands of Prussia, of the German commonwealth and of the German cooperative federations with the influence of Prussia still predominating. Its capital is 210,000,000 marks. The credit cooperatives still maintain their provincial banks, which function as intermediaries between the Preussen-Kasse and the individual societies.

The service of the German credit and farm cooperatives to the members of the urban and rural middle classes has been at all times undisputed, but more and more they are coming to serve working men and salaried employees, especially in the small rural and urban communities.

The credit cooperatives of Austria have been based almost entirely on the German form. In 1914 out of about 19,700 cooperative societies in Austria (not including Hungary) 11,900 were credit cooperatives, 8400 being Raiffeisen societies and 3500 Schulze-Delitzsch societies, largely dependent, however, on state aid. The Austrian legislation of 1873 followed the Prussian act of 1867 and preceded the German imperial law of 1889 in permitting both limited and unlimited liability. About 35 percent of the Austrian cooperatives before the war were German societies. In 1929 there existed 2303 credit societies, 1758 of which were rural credit cooperatives of the Raiffeisen type.

ERNST GRÜNFELD

FRANCE. *Consumers' Cooperation.* One of the first examples of genuine consumers' cooperation in nineteenth century France is the society Commerce Vêridique et Social founded in Lyons in 1855 by an association of weavers under the leadership of Michel Derrion and Joseph Reynier. About the same time some philanthropic attempts to found consumers' cooperatives had been made under the influence of the disciples of Fourier and Saint-Simon.

It was not, however, until some time after the disillusionment following the Revolution of 1848 that new attempts were made to found consumers' cooperatives. This was during the period of 1866-67, when consumers' cooperatives were being experimented with in practically every country of Europe. The center of this newer movement, under the leadership of Eugène Flotard, was again the industrial city of Lyons. The movement was scattered and local and was almost entirely destroyed by the war of 1870 and the subsequent depression. Nevertheless, in 1880 there were about 300 such societies without any unified organization or program. Léon Say, Jules Simon, Léon Walras and other liberal economists regarded such societies as savings organizations and therefore instruments of social conservatism, an attitude which was responsible in part for the favorable cooperative legislation of 1867. Most socialists under the influence of Marxism regarded the cooperatives as insignificant powerless groups whose only influence could be deterrent and definitely condemned the movement at the Socialist Congress of 1879 at Marseille.

The revival of cooperation, its creation as an independent movement distinct from socialism on the one hand or from capitalist economics on the other, and the beginnings of national federation took place in Nîmes, which was neither an industrial nor a labor center. The leader of this revival, Édouard de Boyve, received his inspiration from the English cooperative movement and especially from the moral tone of the Christian Socialist leaders, who at the time, however, were stressing producers' cooperation. Associated with him were August Fabre, a Fourierist, and Charles Gide, then professor at the University of Montpellier. About a hundred associations answered de Boyve's summons for the first congress of the French cooperative movement, held in Paris in 1885. This congress created a cooperative union modeled on the English unions and began a small monthly journal, *Émancipation*, which is still in existence.

Two forces disturbed this union and interfered with its progress. The first was the formation in 1895 of a separate federation of the socialist cooperatives known as the Bourse Coopérative des Sociétés de Consommation. The second was the dispute over the inclusion of the producers' cooperatives and the copartnerships. As a result, however, there came that clarification in doctrine which finally led to the program of the group known as L'École de Nîmes.

Progress manifested itself in the successful establishment of a wholesale society, the Magasin de Gros, in 1906. The break with the socialists was healed when, thanks to the attitude of some socialists, notably Jean Jaurès, and the influence of the Belgian and English cooperative movement, the two federations were united in 1912 in the *Fédération Nationale des Coopératives de Consommation*, whose charter was based on the Rochdale program as supplemented by L'École de Nîmes. The movement despite the protest of a minority has remained politically neutral.

The World War in France as in most countries strengthened the cooperative movement. Its services to consumers during the period of profiteering and to the civil and military authorities won for it a new attitude of respect from the government. In fact, cooperatives were established among the troops, in the manufacture of war materials and after the war in the reconstruction of the devastated areas. This new attitude was embodied in the creation of the official *Conseil Supérieur de la Coopération* to function in an advisory capacity to the cooperatives and in the creation of an endowment fund to aid in the organization of cooperatives. Until 1918 43,000,000 francs had been so appropriated in contrast with 1,000,000,000 francs for credit co-operation. Moreover, the *Fédération Nationale* is represented on all official extraparlimentary bodies, such as the *Conseil National Économique*, the *Comité de la Vie Chère*, the *Conseil des Chemins de Fer*, the *Conseil Supérieur du Travail* and the like.

The progress of the movement since the war is shown in several ways. Before the war not a fifth of the cooperative societies were affiliated with the national federation; at present, although France still lags behind other countries, the federation includes half the French societies and more than two thirds of the country's total membership. Although the membership of all consumers' societies tripled from 865,000 in 1914 to 2,285,000 in 1928 it still represents the comparatively small proportion of 5.5 percent of the population of France, or about 20 percent of the households, as contrasted with percentages as high as 50 for other countries. The number of societies was 3513 in 1928 as compared with 3261 in 1914. The increase has been very slight because of the tendency of societies to amalgamate, a desirable procedure which may account in part for the reduction of purchases per member to less than 300 pre-war francs in 1928 as

compared with 356 francs in 1914. The total sales amounted in 1914 to 315,000,000 francs and in 1928 to 3,353,000,000 francs; the latter figure when reduced to the terms of the pre-war franc indicates an increase in total sales only slightly more than twofold. The wholesale society's business rose from 11,000,000 francs in 1914 to 700,000,000 francs in 1928 or, translated into pre-war francs, to about 140,000,000. A central cooperative bank, *La Banque des Coopératives de France*, was established in 1922; since then its volume of business has been increasing rapidly. Comparatively little progress has been made in the field of production, which is limited to a few shoe and canning factories. Partially because of the small labor force employed the French consumers' movement has been free of the problem of industrial relations as it has arisen in the English and German organizations.

The significance of the French movement is also manifested in its influence on the life of the community as a whole. Mention has already been made of its recognition by the French government. In accordance with the provision that a part of its surplus is to be devoted to educational endeavor the French consumers' movement has set up its own school for the training of executives and has in addition been responsible for the introduction of a course on cooperative principles and practise in the *Collège de France* (1920-30). The *Association pour l'Enseignement de la Coopération* is endeavoring to extend this teaching to other universities and to secondary and elementary schools.

CHARLES GIDE

Credit Co-operation. The first projects for the organization of credit on a basis of cooperation and mutuality date in France from the period of social upheaval between 1830 and 1848. As early as 1831 Buchez in his outlines for social workshops approached the question of credit by his provision of a reserve fund to furnish the means of work for members of the association. Somewhat later Proudhon saw the solution of every social and economic problem in the reform of the system of exchange and credit. His short lived *Banque du Peuple*, founded in January, 1849, was an attempt to carry out in practise the principles he had previously expressed in his plan for an exchange bank which in return for bills of exchange representing goods sold on time credit would furnish "circulatory credits" making possible the purchase of other goods by

the bank's clients. In this scheme mutuality and reciprocity of services would make interest unnecessary: exchange would in effect be based on cash rather than on credit. The plans of François Vidal (1814-72), enunciated about the same time, included the creation of land and farm mortgage loan banks (*crédit foncier et agricole*) as part of a producers' cooperative scheme.

The *Crédit Foncier* (mortgage loan bank), established in 1852, and the *Société de Crédit Agricole*, established in 1860 and allied with it, were both highly centralized banking institutions rather than cooperative organizations. Although it was provided with ample funds, the quest for high profits drove the *Société* to disastrous speculative and financial operations which resulted finally in its failure in 1876.

The appearance of genuine successful credit cooperation was connected with several developments: the rise of organizations among farmers, an acceptance of the principles of voluntary initiative and decentralization as well as the passage of legislation affecting the form of rural credit associations and giving aid to them. The rise of *syndicats agricoles* beginning in 1884 made possible the organization of agricultural credit on a voluntary basis by a local group with common economic interests. Thus the first agricultural credit cooperative, the *Crédit Mutuel de Poligny*, was founded in 1885 by a rural *syndicat*.

In the meantime the success of an urban experiment in cooperative credit, the *Centre Fédératif de Crédit Populaire* founded by E. Rostand at Marseille in 1890, led to a realization of the value of certain principles: political and religious neutrality, variation in methods to meet local conditions, decentralization, the local utilization of savings, scope for private initiative with state aid, and sympathetic cooperation between credit societies and other associations of the same social group. Urban credit cooperation has not, however, developed later on so large a scale as has rural cooperation. Some people's banks, as these urban credit institutions are known, are in fact semiphilanthropic organizations rather than genuine cooperatives.

Rural credit societies remaining few and isolated until the law of November 5, 1894, allowed credit groups a considerable amount of discretion in the framing of their by-laws and in limiting the liability of members. The act of November 17, 1897, afforded them the necessary capital by ratifying a prior agreement with the Bank of France which stipulated that the bank should advance to the state without interest a

lump sum of 40,000,000 francs and an annual contribution to be used for agricultural credit purposes. The law of March 31, 1899, created *caisses régionales* (regional banks), one for each group of local societies, which were the agencies to receive this state aid. The law of August 5, 1920, not only codified all previous legislative acts but also created the *Caisse Nationale*, a national bank for agricultural credit.

At the present time the organization of the system is as follows: the constituency of the local credit societies is made up of members of specialized *syndicats agricoles*, agricultural mutual insurance associations, cooperatives and other societies with specialized collective interests whose membership is entirely agricultural. Capital is formed by allotted "nominative" (quasi-registered) shares limited to 6 percent interest. The local societies serve their membership only and have the function of passing upon the securities that borrowers offer. The regional banks back the local societies by discounting their paper; they derive their funds from savings deposits and the advances of the national bank. The *Caisse Nationale* is a public institution charged with the administration of the government subventions for agricultural credit and the supervision of the regional banks.

Progress has been steady since 1894 and especially rapid since the World War. At the end of 1929 there were in France 5897 local credit societies comprising 433,400 members. They disposed of a paid up capital of 82,838,000 francs and their reserves approached 28,000,000 francs. They were grouped into one hundred regional banks, whose joint capital stock amounted to 117,716,000 francs and reserves to 100,832,000. In 1929 the regional banks had on deposit 2,341,000,000 francs, an amount sufficiently large to support without outside aid the short term financing done by these banks.

Although the national bank was thus able to reserve its funds for exclusive use in intermediate and long term credits, such funds have proved inadequate to meet the demands made upon it. Additional government aid was therefore extended by the law of July 15, 1928, which opened a credit of 500,000,000 francs for intermediate loans, and by the law of August 4, 1929, which opened a credit of 250,000,000 francs for loans to farm cooperatives. By the end of 1929 the national bank disposed of government grants aggregating almost one billion francs. The relative importance of intermediate agricultural credit is illustrated by the fact that during 1928

there were granted 9130 new intermediate loans amounting in the aggregate to about 138,000,000 francs, while 55,226 farm families enjoyed the benefit of individual long term loans at the end of 1929. The latter figure includes the beneficiaries of special individual long term loans, which are given to military pensioners and civil victims of the war. At the end of 1929 there were also 229,958,000 francs outstanding in collective long term loans. Provision for such credits was made by the law of August 5, 1920. They are granted to cooperatives engaged in raising, processing, storing or marketing the agricultural produce of their members, to syndical associations with a purely agricultural purpose and to rural special purpose societies such as cooperative electric plants.

MICHEL AUGÉ-LARIBÉ

Agricultural Cooperation. Agricultural cooperative institutions in France are not known solely by the name cooperatives. The oldest were founded under the name of *syndicats*; moreover there are banks of mutual credit and mutual insurance societies which are essentially cooperative institutions although they do not use this designation. The legal distinction between *syndicats* and cooperatives is that the *syndicats* may not distribute their profits among their members, while this is permissible for cooperatives.

Agricultural cooperation in France developed during the great agricultural depression of the last quarter of the nineteenth century. The fact that it was not designed in accordance with any general plan but represented a spontaneous uncoordinated growth accounts for the diversity in forms of organization. At times a single organization has several functions: purchasing, processing, marketing and credit. In other cases there is a cooperative or a *syndical* for each special function.

The oldest cooperatives were established under the law of March 21, 1884, for the common purchase of fertilizers and the control of their quality. Later these purchasing societies extended their operations to a very great number of other agricultural requirements such as seed, equipment and even household articles. While there have been but few attempts at cooperative cultivation of the soil, hundreds of *syndicats* or cooperatives have been organized for the purchase or rental of costly equipment, for the collective use of tractors and grain sorters and among the larger cultivators for the use of

powerful agricultural machines driven by electricity. Within the past few years processing cooperatives have become quite numerous; they do yeoman service in regions of small farms where the peasants have not a sufficient working capital. More recently farm cooperation has been turning toward collective storage (with grading) and marketing of products. Bills pending before the Chamber of Deputies envisage the creation by agricultural and consumers' cooperatives of joint processing and marketing organizations designed to facilitate intertrading between these two branches of cooperation.

While there are no exact statistics on agricultural cooperation in France, it is estimated that from 1,500,000 to 2,000,000 farmers are enrolled in 10,000 *syndicats* and in 4000 to 5000 farm cooperatives exclusive of the banks of mutual credit and mutual insurance societies. Farmers' organizations include 2000 creameries and cheese factories, 700 to 800 cooperatives for threshing and the use of equipment, 500 underground storehouses, 200 distilleries, some 50 oil presses and a few flour mills and bakeries. There also exist cooperative stock breeding and dairy inspection associations.

Although the farm cooperatives of France often operate in a very limited territory those of the same *département* or region readily federate. The regional unions combine again into national associations: the Union Centrale des Syndicats Agricoles, the Fédération Nationale de la Coopération et de la Mutualité Agricole and at the top the Confédération Nationale des Associations Agricoles.

MICHEL AUGÉ-LARIBÉ

BELGIUM. The Belgian cooperative movement, unique in many of its phases, arose as did the Rochdale movement from the working masses. It has at all times, however, been possessed of a militant spirit unknown to the peaceful Rochdale group, for the conscious purpose of making the cooperative societies an edifice on which a trade union and socialist movement, impossible to create during a period of oppression, would be built. The present movement, begun in 1880, was preceded as in France and Switzerland by a few unsuccessful paternalistic attempts in the sixties on the part of the government or of philanthropic Fourierists. The socialist Édouard Ansele, who founded the Vooruit in Ghent in 1880, was inspired by the English societies which he had seen at first hand as a laborer on the London docks. The Ghent

society, begun by weavers, followed its example in the establishment of bakeries which sold bread at current market prices. Unlike other consumers' cooperatives, however, profits were not redistributed to the membership but allowed to accumulate in a reserve fund which was then used as a mutual benefit fund. From the beginning every effort was made to keep in touch with every phase of the workers' daily lives. The founding of a *maison du peuple* by the Ghent society in 1884 to serve as an educational and recreational center for the people has led to the existence in 1928 of 342 such buildings, housing restaurants, theaters, libraries, lecture and concert halls, in the comparatively small territory of Belgium. No other cooperative group so completely pervades the lives of its members as does this one.

By 1900 a national federation, the Office Coopérative Belge, was formed and in 1902 a wholesale society, the Fédération des Sociétés Coopératives Belges. Two labor banks, serving trade unionists as well as cooperatives, and a mutual insurance society, the Prévoyance Sociale, are other Belgian cooperative institutions. In contrast to the movement in France the Belgian cooperatives have stressed production both through consumers' societies and by autonomous workers' cooperatives. There is no conflict between these two groups, however, and a central society for procuring capital and fostering sales serves both types. Anseel's encouragement to enter the field of production has, however, brought some criticism from more radical socialists.

Despite the fact that the Belgian cooperatives do not exclude non-socialists their decided political character has kept out a large potential membership from the middle class and the non-socialist working groups. Their membership of 300,000 is less than that of cooperatives in Switzerland, a country with half of Belgium's population. This membership is concentrated in sixty societies, which control almost 1000 stores with total sales amounting in 1928 to 760,000,-000 Belgian francs.

In addition to the socialist movement the Boerenbond, founded in 1890 with the aid of the Catholic clergy, has a membership of 128,000 members in more than 1200 societies. Not all of these, however, are consumers' societies; since the organization is largely rural, many of them are credit societies or associations for the purchasing of production requirements. There also exists a civil service cooperative organization

composed of fifty-five societies with a membership of 122,000.

The fact that the Belgian societies are more flourishing in the industrial textile centers and in the coal mining districts, which are populated by the Latin Walloons, than in the regions occupied by the Flemings, who belong to the Teutonic group presumably superior in cooperative endeavor, suggests that the economic factor is of greater influence than the ethnographic.

CHARLES GIDE

SWITZERLAND. Both consumers' and agricultural cooperatives have reached a high point of development in Switzerland. Although certain trading relations exist between the two types of societies, they have little in common and their policies on many public questions are in direct opposition to each other. Neither organization is in any way connected with the state; legislation on cooperative societies has from the outset been most favorable.

The consumers' movement is mainly urban. Its first successful experiment dates back to 1850 and was initiated by Fourierists under the leadership of Karl Bürkli (1823-1901) and J. J. Treichler (1822-1906). Later experiments in the sixties were more definitely influenced by the Rochdale system, which is now the predominant form. At present (1930) the consumers' organizations, most of which are affiliated with the Union of Swiss Consumers' Societies, number almost 400,000 and represent more than 40 percent of the population. In certain cities, such as Basel, the cooperative density is even greater and the purchases per member are higher than in other cities in western Europe. The leadership of the union is to a large extent liberal and its membership in part at least is working class and socialistic. The union acts as a wholesale and has developed many auxiliary functions and societies dealing with banking, insurance and industrial production. It has an active cooperative press. The Basel cooperatives, for instance, used part of their surplus funds to found a cooperative garden city.

There exists also an agricultural consumers' union in eastern Switzerland and allied to it a relatively small Roman Catholic organization with an auxiliary bank. Both neutral and Catholic unions are members of the International Cooperative Alliance.

A small industrial productive movement exists. Credit cooperation has never developed to any great extent in Switzerland and its need

has apparently not been felt. Schulze-Delitzsch banks exist but are not now markedly cooperative in character. There is also a rural movement on Raiffeisen lines promoted by the Catholic church, but it has not attained any great importance.

The agricultural cooperative movement probably includes the entire peasant population and while confining itself to a limited number of the business activities of the peasant has organized these with remarkable success. Its most complete achievement is the organization of milk disposal. Practically all Swiss dairymen are members of local cooperative societies which either retail the milk to the towns or have it manufactured into cheese by cheese makers, who receive a fixed payment for their services. Cheese is sold in the home market by federations of local societies, but all export is in the hands of an export union in which producers, exporters and cheese makers are equitably represented. Complete control of the product is assured and an ingenious system regulates the distribution of profits and losses. The producers' organizations are based on unlimited liability. This system is applied to all Swiss agricultural societies, including those dealing in agricultural requirements and marketing the farmers' grain. These warehouse societies are organized regionally and, for certain purposes, in a national wholesale society and operate with marked success. They worked in connection with the state wheat administration during the period of its existence. Spirit distilling and the marketing of meat, eggs, fruit and vegetables have all been undertaken cooperatively but not on a large scale. No exclusively cooperative central organization exists for the agricultural societies, but such functions as are not fulfilled by the commodity unions are performed by the Swiss Peasants' Union, which represents the movement in the International Commission of Agriculture.

MARGARET DIGBY

ITALY. Consumers' Cooperation. The first national cooperative federation in Italy, the Lega Nazionale delle Cooperative, founded in Milan in 1886 (by sixty-eight societies), included not only consumers' cooperatives but every other form, even the mutual aid societies. Prior to this time several local societies among specialized occupational groups had been formed. In the periods from 1850 to 1865 several stores were opened in Turin under the Fourierist influence of the Zurich societies and operated on

a cost-price basis. Rochdale principles were introduced as early as 1861 by Francesco Vignano (1806-91) and later by Luigi Buffoli (1850-1914), who was responsible for the setting up of such societies among railway employees and headed the Unione Cooperativa of Milan. In 1914 consumers' societies included half a million members, the greater portion of whom were in the provinces of the north.

During the World War the cooperative movement took over many public functions with government financial aid and subsidy but not without some corruption of cooperative principles and practices. In 1921 the Lega was at the height of its development and comprised some 3700 societies. Its markedly socialistic tendencies despite an avowed adherence to Rochdale principles, as exemplified in an alliance in 1920 with the Socialist party, resulted in the withdrawal of clerical groups and then of the liberals under the leadership of Luigi Luzzatti, who had founded the Italian credit movement.

One of the first acts of Fascism was the destruction of the socialistic Lega, whose offices were closed and whose stores were plundered. The Fascist government then created an official government body, Ente Nazionale della Cooperazione, which in the task of reassembling the cooperatives selected those acceptable to it and instituted a rigid system of inspection and audits, established a training school for executives, published several journals and held a cooperative exposition in Rome in 1928. The Ente, which is a corporative body of all types of cooperatives, claimed an affiliation of 3334 consumers' societies with 826,000 members and with sales of 1664 million lire; its total affiliation includes about 8500 societies with a membership of two million. The International Cooperative Alliance considers the principles of the Ente contrary to its own, despite its alleged political neutrality, because of the latter's insistence that membership and constituent societies be conducted on Fascist lines and because of the suppression of non-Fascist societies.

CHARLES GIDE

Credit Cooperation. The ideological source of all cooperative activity in Italy can be traced to Mazzini, who under the influence of Saint-Simonism and humanism included cooperative endeavor in his social program for a united Italy. Among those of his disciples who endeavored to carry out this aim in the sixties the liberal statesman Luigi Luzzatti (1841-1927) was respon-

sible for the initiation of credit cooperation, for many years the most important form of cooperation in Italy, and he served as its leader until his death in spite of his preoccupation with public office. In 1863 he published *La diffusione del credito e le banche popolari* (Padua); in 1864 he founded a credit cooperative in Lodi and in 1865 in Milan, the latter serving as a model for subsequent urban credit cooperatives. Luzzatti owed much to the German Schulze-Delitzsch, whom he had known in earlier years, but his societies were definitely adapted to Italian conditions—shares were somewhat smaller, liability was limited, small loans were encouraged, more representative managing boards of unpaid officials were established and a careful selection of members made it possible to extend loans "on honor." The membership of the societies consisted largely of owners of medium and small size enterprises in trade, manufacturing and agriculture without trade or class demarcations, for Luzzatti like Schulze-Delitzsch believed in combining these groups. In 1876 a national federation, *Associazione fra le Banche Popolari Cooperative Italiane*, and in 1913 a central banking institution, *Istituto Nazionale di Credito per la Cooperazione*, were formed in Rome. In 1923 the Luzzatti federation had 829 member banks with 1219 branches and 494,844 individual members, paid up capital of 180,000,000 lire, reserves of 139,000,000 lire and total deposits of 4,168,300,000 lire.

Rural credit cooperation was introduced into Italy in 1883 by Leone Wollemborg, subsequently Liberal minister of finance, by the formation of a society in Lombruggia, where Wollemborg was a large property owner. Although based on Raiffeisen principles these societies, in contrast to the German, maintained friendly relations with the urban societies, and both Wollemborg and Luzzatti found support for their projects through reciprocity with the many savings and loan associations and friendly societies. Wollemborg, who like Luzzatti was of Jewish origin, did not stress the religious element as did Raiffeisen, and because of this religious neutrality Catholic credit cooperatives, initiated under the leadership of Luigi Cerutti, who established a Catholic loan association in Venice in 1890, soon outnumbered the neutral societies in the proportion of seven to one. The neutral societies are nationally federated in the *Federazione Nazionale delle Casse Rurali Italiane* with a central bank, the *Banca Nazionale delle Casse Rurali* in Rome; the Catholic societies into the *Federa-*

zione Italiana delle Casse Rurali with a bank, *Credito Federale Agricolo*, also located in Rome. Many of these rural societies resemble the Raiffeisen cooperatives in that they are joint banking, purchasing and selling cooperatives.

In addition to these there exist agrarian banks (*casse agrarie*), which although similar in many ways to the credit cooperatives and sometimes transformed into such have no independent existence but are branches of ordinary banks.

The Fascist government through its official agency, *Ente Nazionale della Cooperazione*, ostensibly permitted the three federations above named to continue but added a new body, *Federazione Nazionale Fascista Cooperativa di Credito Agrario*, to which the others were made subordinate. This created no separate bank of its own but utilized the Luzzatti national bank now known as the *Banca Nazionale del Lavoro*. The bank established in Milan in 1904 by the *Società Umanitaria* still continues to serve co-operative groups.

Although at present some statistics claim 3500 credit societies with a capital of 7,500,000,000 lire, credit cooperatives in the strict sense of the word probably number about 2500 societies with a capital of some 1,500,000,000 lire. These societies together with all other cooperatives are united in the government cooperative superstructure, *Ente Nazionale delle Cooperative*.

ERNST GRÜNFIELD

SCANDINAVIAN COUNTRIES. In Denmark the organizations which have brought cooperative fame and prosperity to the country, and which include a total membership of a million and a half, have been built up entirely on the voluntary principle and without state aid in either legislation or finance. It is true that credit societies were created by special legislation as early as 1850, but both because of the nature of these societies and the comparative freedom of the Danish farmer from the need for such assistance the movement for credit cooperation has never gained headway. The movement proper is of rural origin but of separate initiative in its two main branches, the consumers' societies dating from 1866 and the producers' societies from 1882. The first cooperative store, founded under the leadership of Christian Sonne, was inspired by the Rochdale movement. It was not until 1900, however, that town workers entered the field and even today only 80 out of a total of 1784 stores are urban. Practically all these societies, with a membership of 331,500, are

founded on unlimited liability and are federated for trade and other purposes with their own wholesale society, which had a turnover in 1929 of 142 million kroner, about one third of that of the stores. The wholesale society also functions as a cooperative clearing house for many of the producers' societies, such as the Seed Production Cooperative. The producers' movement began under the leadership of Stiller Anderson with the organization of dairies, of which there are 1370 today. Cooperative bacon factories, established in 1887, were the first to enter the field of cooperative sale as well as production. This involved them in a severe struggle with commercial interests. They now handle 85 per cent of Danish production. In 1925 cooperative butter export associations also entered the marketing field and they now market 40 per cent of the total butter export of the country. Subsequently the export of eggs and the import of seed, feed and manures were undertaken by special cooperative organizations. Membership in these and other production and sale societies is over half a million with a turnover of about 700 million kroner. In addition there are societies with a total membership of about 700,000 for so many special purposes that all the needs of the Danish agriculturist are provided for by cooperative organizations. The intricate regional and commodity federations of the agricultural movement are comprised in seventeen national federations or societies of national scope. These national organizations are themselves members of the Federation of Danish Co-operative Societies, which is concerned not with commercial dealings but with methods of organization and with information service. No affiliation fees are paid to the federation, as the income from its weekly paper, *Andelsbladet*, is sufficient to cover the expenses of the secretariat. The functions of the secretariat are of an informational rather than propagandist character. In fact, little propaganda or theorization is necessary, for the whole movement is securely founded upon the high educational level of the countryside, which has been brought about through the agency of the folk high schools. Various national organizations are affiliated with the International Cooperative Alliance.

Finnish cooperation provides an example of a successful and important movement which is neither entirely spontaneous nor to any great extent fostered by the state. A few consumers' societies and dairies were founded toward the end of the nineteenth century. The organized

movement under the leadership of Dr. Hannes Gebhard dates from the foundation in 1899 of the Pellervo, a body modeled after the Irish Agricultural Organisation Society and having for its objects the fostering of the Finnish national spirit and the promotion of a back-to-the-land policy. As a propagandist body it turned its attention largely to the organization of cooperative societies. Credit and dairy societies came first, followed by consumers' societies. These three types predominate, but societies purchasing agricultural requirements together with mills, bakeries, fisheries, sawmills, organizations for the provision of electricity, telephones, bus services and the like have all come into existence and play parts of varying importance. The total membership of the Finnish movement is placed at about 600,000, or one in six of the population. Its stronghold is among the small peasant proprietors of the south and west. Even the consumers' societies—the most important group—are predominantly rural, although a fairly strong section composed of industrial workers exists. Originally both sections were united in the same cooperative union and wholesale society, but in 1916 a split occurred, partly on political grounds, and the two have since set up their own central institutions. The separation does not appear to have entailed any unfortunate results except the uneconomic duplication of productive works. The dairy societies, although they have not developed as far as those of Denmark, do valuable work in the disposal of liquid milk, butter and cheese, of which the last two are sold through a central organization, largely to consumers' societies at home and abroad. The credit societies are after the Raiffeisen model and it is estimated that one peasant in three is a member. Deposits do not cover credits and the central bank receives considerable state support. Pellervo is a member of both the International Co-operative Alliance and the International Commission of Agriculture.

The Swedish cooperative movement apart from a few early experiments dates from the beginning of the present century. It is probably most highly developed on the consumers' side, although agricultural cooperatives of various forms also exist. A consumers' union of a propagandist character was founded in 1899 and assumed wholesale functions soon afterward, gradually developing productive works and insurance services. The movement has now about 400,000 members, of whom more than one half are non-agricultural workers, a fifth farmers and

farm workers and the balance a middle class element. It is to a very large extent rural in character. Political neutrality is observed. It is remarkable for its sound financial position and ample capital resources, for its success in combating match, margarine and other monopolistic trusts and for the educational work it undertakes. The movement among agricultural producers has resulted in a large number of societies purchasing agricultural requirements, which handle farmers' grain and are organized in regional unions and a central union undertaking wholesale business. Dairies are the oldest form of co-operative organization and play a considerable part in the export of butter and in supplying milk to the large towns, a service in which they cooperate with the consumers' societies. The system of cooperation between consumers' and producers' societies is especially well developed in Stockholm. Slaughterhouse and egg marketing societies also exist in considerable numbers and sell both in the home and foreign markets through central trading organizations. Stock breeding and machine using societies are fairly numerous. There are 1500 societies for the distribution of electrical current. There are co-operative building societies of producers for actual construction and of consumers for the provision of housing facilities. The consumers' organizations are affiliated with the International Cooperative Alliance and the agricultural societies with the International Commission of Agriculture.

Of recent origin too is the movement in Norway. The first successful cooperative societies were founded by consumers on the Rochdale system and date from 1894, when the first society was founded under the leadership of O. Dehli (1870-1924). The union and the wholesale society, which form one body known as the Consumers' Cooperative Federation, were not founded until 1906 and gradually extended their activities to include productive, banking and insurance departments. The movement is largely rural in character but is by no means confined to farmers and now includes about 100,000 members. It maintains political neutrality and is affiliated with the International Cooperative Alliance. The agricultural movement includes an extensive system of requirements societies purchasing flour, fodder, fertilizers and machinery for its members and there are also manufacturing and marketing societies, principally dairies, slaughterhouses and mills. There is a special cooperative farmers' bank. The

agricultural movement has no international affiliations.

The wholesales of Norway, Sweden and Denmark are united in the Scandinavian Co-operative Wholesale Society, a trading international body founded in 1918 with headquarters in Copenhagen.

MARGARET DIGBY

RUSSIA. Consumers' Cooperation. Consumers' cooperation appeared in Russia in 1865 contemporaneously with the abolition of serfdom and the beginnings of modern industrialism. In the first thirty years the membership was urban under the leadership of social idealists from the privileged classes; of the 307 societies in 1897 only 56 were in rural districts. The first wholesale, the Moscow Union of Consumers' Societies, was founded in 1898. At the end of the century the membership of all societies did not exceed 250,000. The poverty and ignorance of the working classes and in no small degree the political disabilities of labor accounted for the slow growth of the movement. In the absence of a cooperative law the societies were subject to arbitrary administrative acts; no societies could be organized without the special permission of local authorities, who in various ways hindered their work, prohibiting conferences, publicity, educational work and the right to federate for wholesale operations.

The first revolution of 1905 was a turning point in the history of consumers' cooperation. Thwarted in political and other economic aspirations the masses of labor eagerly accepted cooperation as a means of social betterment. The revolution had awakened new powers of economic initiative and independence among workers and peasants alike. Between 1905 and 1914 the number of societies increased from 950 to 10,080, of which nearly three fourths were now rural in character, and the membership grew from 350,000 to 1,400,000, while the annual turnover rose from 110,000,000 to 290,000,000 rubles, representing 7 percent of the retail trade of the country in articles of general consumption. It was a mass movement of organized consumers for material welfare, in self-defense against exploitation, exorbitant prices and the inefficiency of private trade. The Rochdale principles were generally accepted, although in practise the Russian societies were too often compelled by reason of their limited capital and the poverty of their members to depart from the established principles of true co-

operation by selling goods below market prices, extending credit on sales and trading with non-members. There was still no cooperative law, and the government opposed every form of united action for wholesale trade and common policy. Only ten small consumers' unions operated in 1914.

The rate of cooperative expansion was even greater during the World War. In January, 1918, the primary societies numbered 35,000 with a membership of 11,550,000; the turnover was 1,300,000,000 gold rubles, or about 46 percent of the retail trade. As an institution for orderly distribution consumers' cooperation was a movement unequaled in the history of Russian trade. One year later the membership jumped to 17,000,000. The expansion was in part abnormal, stimulated by the food crisis and demoralized markets; it represented, however, the only organized, planned system for supply and distribution seeking to arrest economic chaos. In many regions the local societies formed multiple or chain store associations, while the number of wholesale federations grew apace, particularly with the removal of czarist restrictions. In March, 1918, the unions numbered 514, of which 60 were mainly provincial and 10 were territorial in the extent of their operations, covering whole areas such as south Russia, Siberia and the Ural mountain region. The Moscow Union was reorganized as a national federation, known as the *Centrosoyuz*, affiliating three fourths of the unions.

The leaders of cooperation in Russia have from the beginning conceived the movement as a unified activity for material and cultural betterment. They recognized that the success of cooperation was largely conditioned by the general level of education and intelligence, which were to be promoted through schools, lectures, publications, playgrounds, concerts, conferences, reading rooms and various community activities for the dissemination of knowledge and the enrichment of social life. This cultural work, classless and politically neutral in origin, came to be known as the "non-trading function," intended to stimulate new social forms and a social consciousness. Cooperation at first carried no revolutionary principle; it was conceived mainly as a socializing economic force within the framework of capitalist society. A cooperative school of university grade was established in 1913 in the Moscow Peoples' University. In October, 1918, there were 70 periodicals published by consumers' unions, and over 400

new titles of books and pamphlets were issued in that year. In the field the consumers' organizations employed over 1500 instructors for various educational and cultural tasks.

The system of consumers' cooperation became necessary to the state. From the outset of the war the government was constrained in dealing with the supply problem to enlist the *zemstvos* and other municipal bodies, which in most instances utilized the existing trading apparatus of the consumers' stores and unions. With the exigencies of the war, scarcity of goods and state control the movement gradually enlarged its operations as an agent of the state at the expense of independent action in the markets of the country. In recognition of its national importance the Duma had under consideration in 1916 an act granting it full legal status and freedom of economic and social action; but in higher political circles the power of organized consumers was regarded with deep apprehension and mistrust as a state within a state. It was left to the Provisional Government to enact into law the cooperative code as it was planned by the Duma, giving full economic autonomy for trade, production, organization and education. The Central Cooperative Committee, which the old government suppressed in 1915, at once issued a call for a national congress, the third in the history of Russian cooperation, and before this congress the new government pleaded with the consumers' societies to take upon their "broad and powerful shoulders" the work of organizing the food supply of the country.

The movement was not strong enough to hold in check the forces of disintegration under the conditions of economic exhaustion, political strife, inflation and the breakdown of transport and credit. Politics was in the saddle, and every new national or regional authority with its regulatory agencies and policies only aimed to bend the consumers' organization to its own will, progressively depriving the movement of its fundamental principles and methods of economic work. The Soviet regime only completed the process of depersonalizing the consumers' movement, defending its course on the grounds of the food crisis, military necessity, the blockade and the cause of the revolution. The movement was thus bound to carry out the policies of the Communist party. The *Centrosoyuz* made large purchases from the state syndicates and distributed the goods among local unions according to the purchasing power of the regions and the plans of the Commissariat of Supply. In monopolized

articles the cooperatives were little more than agents of the government. Then the Communist party made an open drive to convert the movement into a state organization in form as well as in fact, first by separating workers' from peasants' societies and then by detaching the class conscious labor element from the general urban membership. For a time the old leadership resisted this political encroachment, but after a period of "boring from within" and denunciations of the old leadership as protagonists of bourgeois economic prejudices and as enemies of the proletariat it was possible to replace the old boards with new men, and the way was opened for greater centralization and control. By the decree of March 20, 1919, compulsory membership became a fact, and the consumers' movement became the contracting agency of the government. The decree nationalized the distributive apparatus and introduced government appointees on the boards of management. But every step in the direction of bureaucracy and government tutelage only lowered the efficiency of the system; as a state organ it was powerless to achieve by force and requisitioning what the cooperatives succeeded in gaining through their methods of free exchange and mutual advantage.

The reestablishment of free markets under the New Economic Policy in 1921 was soon followed by the restoration of the financial and commercial autonomy of consumers' cooperation and its principles of voluntary membership and self-government. Slowly the movement regained its former place in trade, while in the five years since 1924, which marked the beginning of "socialist construction" in Soviet economy, its expansion in membership almost tripled the record figures of 1917. Between October, 1924, and October, 1929, the number of stores increased from 35,700 to 110,462; the membership from 7,093,000 to about 33,465,000; the share capital from 15,900,000 rubles to 374,000,000 rubles; and the annual turnover from 1,384,000,000 to 19,192,000,000 rubles. In the retail trade the movement embraced 66 percent, in the wholesale markets 56 percent, of the nation's business. Besides the consumers' primary societies affiliated in 158 district unions for common purchase and sale there are 14 territorial federations in the R.S.F.S.R. and 6 central federations representing the allied union republics. The *Centrosoyus* of U.S.S.R. acts as a central body uniting and coordinating the consumers' movement as a whole, while the Central Co-operative Council aims to articulate the policies

of all types of cooperation in the country. The consumers' unions and federations own and operate grain elevators, refrigeration plants, flour mills, bakeries, canning works, soap factories, fisheries, etc. In 1929 their 9600 plants employed 139,110 workers and produced goods to the value of 1,552,900,000 rubles. The cultural activities of the societies include kindergartens, playgrounds, mother and child corners, book-stalls, training courses, clubs, reading rooms, etc., while the unions and federations maintain training schools of various grades, newspapers, research and publication and the higher cooperative institutes at Leningrad, Moscow, Kiev and Kharkov.

The phenomenal growth of consumers' cooperation since 1924 may be traced to the policy of reaching out to enlist the poorest classes by a low entrance fee of one half ruble and a membership share varying with income grades; but it was also due to merchandising efficiency, low prices and in part to the preferential treatment received at the hands of state industry in goods, storage, transportation and credit. It is the declared policy of the Soviet government to socialize the field of production and distribution as well under a planned national economy of industry and trade and thus establish a "closed economic system." The *Centrosoyus* is the planning agency of the organized consumers. It represents their interests before the state in all matters of trade and legislation; it plans the supply and movement of goods through a system of estimates and preliminary orders placed by the affiliated unions and through general contracts and agreements with state industries and with agricultural and handicraft cooperatives. In conformity with the Five-Year Plan of industrialization the *Centrosoyus* has drawn up a five-year plan of consumers' cooperation in order to achieve the maximum coordination of the interests of state industry and consumption. By this plan the cooperative system will federate by October, 1933, 47,000,000 members and control 70 percent of the trade; it will reduce working expenses and prices through greater efficiency and fresh capital investment in productive enterprises—from warehouses and mills to bakeries and dining halls.

EUGENE M. KAYDEN

Credit Cooperation. Credit cooperation in Russia has been almost entirely confined to agricultural credit. The institutions providing such credit date back to the period immediately

following the emancipation of the peasants in 1861. The breaking up of the semifeudal ties between the landlord and his serf not only introduced far reaching changes in the traditional structure of social and legal relationships but completely transformed the economic foundation of Russian agriculture from a semi-autonomous to an exchange and money economy. This general trend was intensified by the development of transport and the subsequent appearance of Russian agricultural products on the world market. The resulting need for an increase in the capitalization of agriculture created a demand for credit which was at first met by the primitive method of usury. Of the few who understood the character and consequences of this process the brothers Lughinin, enlightened wealthy landowners, deserve special mention. The Rozhdestvensky Savings and Loan Association founded by them in 1866, which became the corner stone of the Russian system of cooperative credit, represented an adaptation of the western European forms to the conditions of Russian peasant farming.

Thereafter until the establishment of Soviet rule credit cooperation was the outstanding form of cooperation in the agricultural communities of Russia. With a few notable exceptions the formation of special marketing, purchasing or producing cooperatives lagged far behind. The rapid and widespread growth of these cooperatives was the more remarkable because of the difficulties encountered in creating such institutions among a peasantry accustomed to a semi-autonomous economy and scattered over a vast area.

This growth was characterized by three distinct periods of development. The first period up to 1895 was one of local, voluntary growth unaided or even hampered by the indifference or suspicion of the government. The energetic activities of unofficial organizations, especially of a committee set up by the Moscow Agricultural Society on the initiative of Prince A. J. Vassilchikov and of A. V. Yakovlev, resulted in the formation of more than 600 savings and loan associations with about 220,000 members and 29,000,000 rubles of operating funds.

The second period was initiated by a definitely sympathetic governmental attitude embodied in the law of 1895 granting credit associations a special legal status. This law provided for savings and loan associations resembling the Schulze-Delitzsch type and credit societies of the Raiffeisen type. The legal provisions as to

membership and liability for both types, however, were unique and justify the designation of Russian system. Within the next ten years 658 credit societies and 433 savings and loan associations were organized, the aggregate assets of which reached the sum of 61,000,000 rubles by 1904. In that year a second law allowing the societies and associations to form local unions and authorizing zemstvos (local government bodies) to organize banks of small credit, which were to assume the functions of regional cooperative banks, made possible considerable improvements by providing the bases for a broader regional scope. The first zemstvo bank was established in 1907 in the province of Ples-sarabia. The change in government attitude was expressed also by the provision for substantial financial aid through the national treasury and the State Bank. It also initiated a supervisory system in 1895 of government appointed inspectors of small credit whose work was eventually coordinated in a board of small credit, a government agency which stimulated the expansion of the network of cooperative institutions on a sound basis of organization.

The third period, out of which grew the national institutions for credit cooperation which in turn strengthened and accelerated local development, was initiated by the calling of the first All Russian Cooperative Congress, which met in Moscow in 1908. As a result of the decision of the congress to complete the structure of cooperative credit by the establishment of a central cooperative bank, the Moskovsky Narodny (People's) Bank was formed in 1912. The growth of credit societies and associations is reflected in the following figures: in 1910, 1305 new cooperative credit societies and associations were organized; in 1911, 1856; in 1912, 2436; in 1913, 2022; and in 1914, 1487. In 1914 the total number of cooperative associations reached the impressive figure of 13,000, of which no less than 73 percent were credit societies. Of the total membership, which had grown from 1,400,000 in 1908 to 8,250,000 by 1914, four fifths belonged to credit societies, whose operating funds exceeded 600,000,000 rubles.

Although the war did not stop the growth of Russian credit cooperation it reduced somewhat the rate of expansion of local institutions. New difficulties during the war period, of which the most important was the influx of deposits accompanied by a decline in the demand for loans, were adequately met.

At the outbreak of the revolutionary dis-

turbances of 1917 Russia thus possessed the three essential elements of a well developed system of cooperative credit: at the base an extensive network of local credit societies and savings and loan associations (16,500 units with a membership of 10,500,000 and operating funds of 983,000,000); at the intermediate stage local unions, of which there were 136, and provincial zemstvo banks, of which there were 247; and at the top a central cooperative bank, the Moskovsky Narodny Bank. The only defect of this structure lay in the difficulty, experienced by the provincial institutions and the central bank, which had appeared at a late stage of the development, of keeping pace with the expansion at the base.

The importance of these associations was shown by the fact that in 1917 the households affiliated with cooperative credit organizations represented a total population considerably over 60,000,000, forming about one half of the total number of peasant households. This membership was almost entirely peasant; the non-peasant element never exceeded 5.5 percent and was often as low as 1.5 percent. Although it is true that at the outset the more prosperous peasant group predominated, the tendency of the movement was more and more to include the lower groups as well. The broad territorial range of these associations, which covered whole volosts (counties), and the character of Russian peasant farming tended to limit their functions; very few cooperative credit organizations assumed the marketing and purchasing functions common to the German unions. Nevertheless, they represented a most influential force for cooperative action in the prerevolutionary agricultural community. The scope of all cooperative organizations was broadened by the comprehensive Statute on Cooperative Associations and Their Unions drafted by cooperative leaders and enacted in the spring of 1917 by the Provisional Government. Its practical effects were nullified, however, when the Bolsheviks came into power.

In the period of "war communism," on the theory that cooperative institutions were incompatible with a fully realized socialist society the Soviet government destroyed the Russian cooperative credit system and dispersed its funds and functions among various governmental or semigovernmental consumers' organizations. At the end of this period, however, in its New Economic Policy the government advanced a compromise formula according to which in a period of the dictatorship of the proletariat the

growth of cooperation was recognized as "identical with the growth of socialism." Soviet cooperation was recognized as a socialist form of economy useful and necessary as a preliminary stage in the development of the socialist organization of society, and certain opportunities for ostensibly independent existence were thrown open to it. In the years 1921 to 1927 there were enacted no less than thirty-five laws bearing directly on cooperative credit, and thirty-four more enactments were concerned with agricultural cooperation, which is closely linked with cooperative credit, no clear line between the two being drawn in Soviet legislation. The principal legislative enactments in force at present are the Resolution of the Central Executive Committee and of the Council of People's Commissars of August 22, 1924, the Law on Cooperative Credit of January 1, 1927, and the Law on Agricultural Cooperation of October 3, 1927. Legally, cooperative associations are subject merely to formal registration, but in fact the organization of cooperative institutions is dependent upon official approval.

At the present time the organization of governmental cooperative credit comprises four divisions: local credit and agricultural credit associations, agricultural credit unions, incorporated societies for agricultural credit covering at least a province and at the top the Central Agricultural Bank, the All Russian Cooperative Bank established in 1922 and practically abolished in 1929 and the State Bank.

This complex organization, comprising in 1926 a membership of about 4,300,000 with assets amounting to some 460,000,000 rubles (increased to 540,000,000 rubles by October, 1927), is maintained by government loans and subventions, individual deposits accounting for merely 14 percent. Its divergence from the accepted basis of credit cooperation is illustrated by the fact that deposit operations which ordinarily are the mainstay of such institutions average less than two rubles per member. The announcement of the policy of reorganizing agriculture on a collective basis is obviously contrary to the strengthening of cooperative agricultural associations, and in such a reorganization the function of credit cooperation will probably disappear.

A. N. ANTSEFEROV

Agricultural Cooperation. Prior to the World War the chief form of agricultural cooperation in Russia was the credit society, which often also

performed marketing, purchasing and processing functions. Separate agricultural supply and processing associations date back to the late seventies, but they developed rapidly only after the revolution of 1905. At the outbreak of the war three fourths of these associations had a membership of dairy farms and only one tenth were for the purchase of supply and implements. There also existed special agricultural producers' associations among the flax growers. In 1914 there were about 476 dairy, creamery and cheese artels in European Russia, and by 1916 this number had doubled. Even more important was the development of a genuine cooperative movement in the dairy and creamery industry of Siberia, introduced in 1902 by A. N. Balakshin. It was initiated with government encouragement and subsidy but later became self-sufficient and led to the formation of the Union of Siberian Creamery Associations. By 1918 there were over 2000 affiliated societies, which carried on an important export business with export agencies in the United States and England. These cooperatives undertook consumers' as well as producers' cooperation.

The whole movement was stimulated by the war and the revolution of March, 1917. It suffered less than did the consumers' cooperatives from the policy of nationalization during the period of "war communism" except that its credit branch was entirely swept away. Yet the movement as a whole naturally suffered in the general economic breakdown; recovery dates from the introduction of the New Economic Policy in 1921, which accepted the cooperative movement as a necessary instrument in certain stages of the development of a socialistic society. Especially since the stabilization of the currency has the growth of agricultural cooperation been very rapid.

There were in 1928 an estimated total of 93,400 societies as against 27,000 in the larger territory of the pre-war Russian Empire. The membership is placed at about 11,000,000 together with perhaps another 1,000,000 for the so-called "wild" societies which are not organized in any union. This brings membership up to 50 percent of the peasant population, but some allowance should be made for the cases of individuals who belong to several societies. Owing to the size of the country and the diversity of its peoples it has been necessary to devise a complicated hierarchic system of organization by which local societies are grouped first in district unions, second in unions covering a

republic, then in central unions for the whole of the Soviet territory. The central unions number fifteen and each includes the societies handling some particular commodity or performing some one service. Their functions are as follows: supply of agricultural requirements, seed growing, butter and dairy produce marketing, livestock (sale of fat stock and meal, also breeding), eggs and poultry marketing, flax and hemp production and marketing, grain sales (working jointly with the state export company and with the English Cooperative Wholesale Society), potato processing and marketing, tobacco preparation and marketing, fruit and vegetable growing and wine making, sugar beet growing and manufacture, cotton production, beekeeping, publishing (books, periodicals and stationery required by the agricultural movement), insurance. In performing these specific functions the cooperative is charged with the task of educating its members concerning improved methods of technology. Measured by turnover the dairy union is the most important, but those dealing in requirements, livestock and grain are not far behind. All the commodity unions undertake marketing except those concerned with sugar beet and cotton, which are purely advisory. All commodity unions are affiliated with the Central Cooperative Bank and with the Union of Unions (Soyuz Soyuzov), with which are also affiliated some of the more important local and regional organizations. This body is not a trading but a policy making organization. A separate central organization exists in the Ukraine.

The total turnover of the agricultural movement in 1926-27 (the last year for which complete figures are available) was 3,130,000,000 rubles, of which rather more than two thirds were for agricultural produce marketed and the remainder for agricultural requirements supplied to members. The cooperative movement has developed an important foreign trade, principally in Germany, the United States, England, Austria, Czechoslovakia and Sweden, which is carried on through its own agencies established at London, Berlin, New York, Paris, Riga and Shanghai. These agencies are occupied with the sale of Russian agricultural produce, including dairy and poultry produce, grain, flax, bacon, furs, raw hides, tobacco, honey and fruit. They import agricultural requirements, especially machinery and appliances; also chemical manures, seeds and pedigreed stock. According to the last available figures, however, these imports amounted to only one tenth of the

exports. Grain sales are carried on through a special joint company, of which the English Cooperative Wholesale Society is a member.

The voluntary agricultural cooperative movement had thus much more than regained its pre-war position and had developed a complex and highly specialized system of catering to all the economic needs of the peasant. In the light of recent developments, however, it is seen that government encouragement of voluntary co-operation was not a permanent policy. The co-operative organizations for the joint use of machinery and other forms of agricultural improvement, which had existed for some time, are now being supplanted by a much further reaching form of association in which individual ownership of land ceases altogether and cultivation is carried on by the group on a communal basis. "Collectivization" of agriculture, undertaken as an integral part of the Five-Year Plan, is now absorbing much of the cooperative system. Cooperative marketing and credit organizations are still maintained, but it is obvious that their basis will differ considerably from that of most countries.

MARGARET DIGBY

SUCCESSION STATES AND BALKAN COUNTRIES.

Cooperation in Czechoslovakia falls into two principal functional divisions: consumers' co-operation, which is in the main urban, working class and socialistic, and producers' co-operation, which apart from a small industrial productive movement is agricultural and adapted to the needs of peasant proprietors with a mainly conservative although not unprogressive outlook. A second cleavage, that of race, cuts across the economic division and results in separate Czech and German movements in every economic category together with less important Slovak, Polish and Ruthenian organizations.

As early as 1867 F. L. Chleborád attempted to set up a comprehensive national organization of producers' and consumers' cooperatives. The present consumers' movement was placed on a firm foundation in the period between 1890 and 1900; it is strongest in the industrial areas of Bohemia and Moravia and probably includes upward of two thirds of the industrial population. It is organized in local societies working on Rochdale principles, with wholesale societies owning productive works. The bulk of its trade is in foodstuffs, but clothing, furniture and the like are also handled. Both Czech and German movements are affiliated with the International

Cooperative Alliance. The central unions of the former include 375,000 members and of the latter about 225,000 members.

The agricultural movement, which in Czech districts was developed under the leadership of F. C. Kampelik (1805-72), is based on credit societies after the Raiffeisen model, the first of which dates from 1868. In its early stages considerable nationalist enthusiasm went into the building up of the Czech side of the movement. Local credit banks exist today in every village. They are on a basis of unlimited liability and are managed by the members. Their business is the making of short term loans to members, receipt of savings deposits and keeping of current accounts. They have further built up their own central banks, which undertake a clearing house business and invest surplus deposits. They hold a leading place among Czech banking institutions. Besides its important service to the individual peasant the credit movement has been the means of promoting other forms of cooperative undertaking: notably the warehouse societies with their central wholesale, engaged in the sale of fertilizers, feeding stuffs and the like to the farmer and the purchase of his grain: the dairy societies; and those engaged in manufacturing processes such as distilling, beet sugar refining, chicory drying, canning and jam making. Co-operative sales of eggs and meat are in their initial stages. An important and characteristic development is the cooperative supply of electricity, in which local distribution is in the hands of a society of current consumers, while production is largely carried on by public utility companies. About 60 percent of the agricultural population of the country is included in the co-operative movement, which plays a leading role in agricultural economy and is steadily growing, especially in the more backward areas of Slovakia. The central organization, Kooperativa, which represents all national groups, is a member of the International Commission of Agriculture.

A national joint committee of consumers' and producers' organizations exists and certain mutual trading operations are arranged, especially in grain. Some similar developments have taken place locally. Neither the consumers' nor the producers' movements are dependent on the state, although the agricultural credit societies took some part in facilitating the post-war distribution of land and are looked to by the government as agents for the dissemination of technical instruction.

The Hungarian cooperative movement presents two salient characteristics: a close dependence on the state and a remarkable blending of the producing and consuming functions. The exceptions to this generalization are a civil service consumers' society (the consumers' Productive and Utilization Society of Hungarian Civil Servants, founded in 1892) and an independent working class consumers' movement (the Union of Hungarian Distributive and Productive Societies), which operates mainly in Budapest. Pre-war Hungary included territory in which various minority cooperative movements existed, but these have all been transferred to other political sovereignties together with large sections of the Hungarian movement. This loss has been met by an intensification of effort within the remaining Hungarian territories.

Two national organizations were established in 1898 in an attempt to meet the agricultural crisis which was then affecting Hungary. The first was the Central Credit Society. The members of this society are local credit societies after the Raiffeisen model, among which subsidiary regional groupings have recently been introduced. The society itself was founded with considerable state capital and admitted as shareholders various local and national institutions as well as private persons. It is controlled by the state with participation by the other elements, including the local banks. It fulfils the ordinary functions of a bank besides undertaking propaganda and auditing for its affiliated societies. The second was the national organization known as Hangya (Ant). The Hangya, an unofficial body created under the leadership of Count Alexander Karolyi, receiving certain state support, is the center for consumers' societies, mainly rural, selling both domestic and agricultural requirements and for societies engaged in marketing the farmers' produce—two functions which are frequently combined. It undertakes educational, propagandist and auditing work and also acts as a wholesale society.

In 1919 the two central organizations combined to set up a central marketing and exporting organization, the Futura, handling mainly cereals but also wool and a few other commodities. Originally an organ of state control, it now works on a cooperative basis, purchasing through local cooperative societies and frequently making advances on crops to be purchased. In addition to these bodies there is an insurance society for agriculturists and a na-

tional central organization of dairies, both working in close collaboration with the Hangya and the Central Credit Society. The Hangya and several other groups are members of the International Cooperative Alliance and of the International Commission of Agriculture.

In Poland the former political disruption of the country and the variety of races which it now includes have led to considerable confusion in the modern cooperative movement. Agricultural cooperation and credit of differing types developed more especially in Austrian and German Poland and consumers' cooperation in Russian Poland. The outstanding leaders in the Polish cooperative movement were Romuald Mielczarski (1871-1926), Edouard Abramowski (1868-1916) and François Stefczyk (1861-1924). The total present membership of cooperative organizations is three and a half millions, or 11 percent of the population of the country; even allowing for some duplication in membership, the cooperative organizations include a considerable proportion of the population. Of this number the largest group is affiliated with credit societies.

The consumers' movement on Rochdale principles was a late growth and made little progress until 1905; it has passed through various vicissitudes and was at one time divided into official, socialist and Christian unions. These have all now amalgamated to form a comprehensive Union of the Polish Republic, which also includes a certain number of Jewish and German societies. The union undertakes education, propaganda and auditing. Closely linked with it is the wholesale society, which imports, exports (largely the agricultural produce of members) and manufactures. A few groups of societies remain outside the Polish union, the most important being the Ukrainian societies, which are estranged for nationalist reasons, and certain agricultural groups.

Credit societies after the Schulze-Delitzsch model were founded about 1850 in German Poland; they spread rapidly, partly under the impetus of national enthusiasm, and were later organized in a union. In Russian Poland credit banks to a large extent lost their cooperative character during the war, but a remnant survived to be amalgamated with the Schulze-Delitzsch union and with certain kindred organizations in Austrian Poland and elsewhere. These include agricultural requirement and dairy produce exporting societies. This group of organizations centers around the central co-

operative bank, in which the credit societies hold a controlling interest. A similar group of organizations, overlapping geographically with the first and equipped with its own central bank, is known as the Federation of Agricultural Unions of the Polish Republic, which had its origin in Austrian Poland and includes a considerable number of creameries and other productive and marketing organizations. There are, moreover, independent groups of Jewish, German and Ukrainian and Russian credit societies. Several of the Polish unions are members of either the International Cooperative Alliance or the International Commission of Agriculture or both.

Rumanian cooperation is almost entirely agricultural in character; the urban consumers' societies are few and except in Transylvania generally weak. As far as the pre-war Rumanian territories are concerned cooperation has been characterized by excessive reliance on the state, which first called it into being among a peasantry unused either to business undertakings or self-government, then financed it liberally from state funds and finally attempted to use it for purposes—such as the carrying through of the post-war land reform—which were admirable and urgent but not in any ordinary sense cooperative. Such action although pardonable in times of great difficulty was demoralizing, and a complete reorganization of the cooperative movement became necessary and was carried through in 1929. The movement is largely one of credit societies, which are now organized in district unions under a national office with an element of official control which it is proposed to reduce in time. The national office is affiliated with the International Commission of Agriculture and the International Cooperative Alliance. There is further a central cooperative bank, mainly based on state funds, and a central cooperative society for import and export, which undertakes the marketing of agricultural produce, mainly grain, in which it acts for the state. State aid is not extended to voluntary consumers' societies, although it was given for a time to a compulsory society of civil servants which was created by the state. Two independent types of cooperation are the fisheries societies on the Danube and lumbering societies, a type of cooperation which appears to be almost entirely confined to Rumania and has there met with considerable success.

In the territories transferred to Rumania after the war a number of cooperative groups exist

representing German, Polish, Hungarian and Jewish minorities. They are nearly all credit or consumers' societies, and those in Transylvania especially are well established and successful.

Cooperation has for many years held a place in the agrarian and social policy of the Bulgarian government and the movement is therefore to a considerable extent officially inspired. An agrarian bank of a semi-official character was founded in 1904 and functioned until 1911, when apparently for political reasons it was replaced by the Cooperative Central Bank, which continued to operate alone until 1921, when the agrarian bank was revived; since then the two have coexisted, the Cooperative Central Bank being more especially concerned with urban development and loans to cooperative undertakings and the agrarian bank with branch business among the peasants. There exists also a third organization, the unofficial Union of People's Banks. The General Union of Bulgarian Agricultural Societies affiliated with the International Commission of Agriculture includes about 1500 organizations, most of them credit banks but the majority with consumers' stores attached. Many also undertake dairies, tobacco factories (which are specially well developed in Bulgaria) and works producing oil of roses and other commodities. The less numerous urban consumers' societies, of which there are about 150, are organized in a wholesale society which is affiliated with the International Cooperative Alliance, as are the people's bank and the Officials' Insurance Society. A few other types of organization exist, including fishery societies. There is a cooperative training school in Sofia. The movement was hampered by the political troubles of the post-war period and suffered severe losses in the earthquake of 1928. These events have also retarded the publication of reliable statistics.

The Yugoslav cooperative movement, like that of Poland and from the same political causes, is excessively broken up for racial, geographical and functional reasons. There are Serbian, Croatian, Slovenian, Dalmatian and a limited number of German societies. The majority are united in the General Federation of Cooperative Unions, but certain organizations, notably those of the Slovene consumers and the German credit societies, remain outside. Societies number between 4000 and 5000, the vast majority being rural in character. More than half are credit societies and most of the remainder are occupied with agricultural supply and market-

ing. A certain number of dairies exist, and many other branches of economic activity, such as housing, fisheries and electrical supply, are represented by a few societies. A development which appears to be unique and is of peculiar interest is the establishment of health co-operatives, which provide their members with medical services. Most of the societies are on a basis of unlimited liability. Their membership is estimated at about half a million. In 1925 a new act was passed removing credit societies from the control of the general federation, setting up fresh societies and establishing a state central bank. This act appears to have met with strong opposition and never to have been carried out in full. A new act is now in preparation which may modify the situation considerably. The Yugoslav central cooperative organizations are affiliated with both the International Cooperative Alliance and the International Commission of Agriculture.

Although preceded by some isolated experiments in the early nineteenth century the modern Greek cooperative movement originated in 1900 with the formation of a local credit and threshing society. A few more credit societies followed together with a few wine growers' organizations. In 1914 a cooperative act was passed to aid tobacco growers, which gave a legal status to the societies, and the state later arranged with the Bank of Greece to make loans to cooperative societies for transmission to peasants settled on land expropriated in the course of the land reform. These steps led to a rapid expansion of the agricultural movement, especially on its credit side. By 1928 it included nearly 5000 societies with a quarter of a million members. Their principal business is in the granting of loans, and the deposits so far built up are inconsiderable. They therefore remain dependent on the Agricultural Bank of Greece, which is backed by the state and in 1930 replaced the Bank of Greece as a central credit institution. Sale of agricultural supplies and marketing of agricultural produce, especially olive oil and wine, have made some progress, and a number of land settlement societies exist which arrange for the transference of expropriated land. The consumers' movement is practically non-existent and urban cooperation is principally represented by industrial productive societies and building societies. None of the Greek co-operative organizations have international affiliations.

MARGARET DUGBY

UNITED STATES AND CANADA. *Consumers' Cooperation.* Consumers' cooperation, aside from insurance, telephone and building and loan societies, has always been backward in the United States compared with the movements in European countries. Yet its history in America dates back to pre-Rochdale days, the early forties, when a Boston tailor, John G. Kaulback, organized his neighbors into a buying club, which later became the first store of a movement extending over ten states and into Canada; the local societies numbered at one time 700 and each operated a store. Civil War enlistments and more especially the westward migration after the war marked the decline of this early movement, although a few of its stores still survive. A second wave of cooperation swept the entire country in the early seventies. In labor groups it was sponsored by the Knights of Labor; among the farmers by the Patrons of Husbandry, better known as the Grangers. To both of these elements, however, cooperation was secondary to other interests, and it therefore failed. From these misdirected efforts, nevertheless, emerged the Sovereigns of Industry, founded in 1874, whose local enterprises covered the eastern states from Maine down to Maryland. In social vision and idealism the Sovereigns stood equal to the British movement at its best, and had economic conditions been ripe there is no doubt that they would have been the founders of an enduring American consumers' cooperative movement.

Following the decline of the Sovereigns, in the later seventies came intermittent awakenings, notably in California and in the north central states; but the beginning of the present established movement properly dates back to the first decade of the century when active propaganda was taken up by the Cooperative League, a New York City organization, with a membership largely Jewish. Its literature had a far reaching influence, and the society itself, operating three hat stores and a hat factory, was the first in this country to embark on consumers' cooperative production. It eventually failed, but members of this group were among those who in 1915 organized the present Cooperative League of the United States. This is a central union, or federation, with a constituency in 1931 of 140 local societies comprising a membership of 125,000 individuals. Its purpose is entirely educational; it publishes a large quantity of literature, including the official organ, *Co-operation*, and gives practical advice to newly formed societies.

The largest number of societies may be found in the north central states, federated in the regional Northern States Co-operative League, which has a dues paying membership of about 50,000, organized in 88 societies. These include a wholesale federation, the Co-operative Central Exchange at Superior, Wisconsin, representing 90 local societies and doing a business of \$2,000,000 a year. An outstanding local society in this region is the Franklin Co-operative Creamery Association of Minneapolis, Minnesota, with over 5000 members, distributing milk and other dairy products to the value of \$3,500,000 a year; this is the largest consumers' co-operative on the continent.

The second largest and most active group covers the eastern states, recently organized in the Eastern States Co-operative League, a federation of 24 societies with 13,000 members scattered largely through Massachusetts, Connecticut, New York and New Jersey. A wholesale federation was organized in 1929. In this region are a number of large societies, chief of which is Consumers' Co-operative Services, Inc., operating a chain of cafeterias and food shops, a credit union and a large housing enterprise. Its 3300 members are mostly office workers.

In the central states coal miners have established a movement of small local store societies centering about Bloomington, Illinois, 13 of which are federated in the Central States Co-operative League. This region ten years ago seemed on the point of developing a significant movement and had established a wholesale federation in East St. Louis, Illinois. It has dwindled largely because the old mistake of making cooperation secondary to labor organization was here repeated.

Among the farmers there are two important groups, one in Nebraska and one in the region centering around Seattle, Washington, each operating a wholesale federation. Both are purely utilitarian without the elements of future expansion.

Ten years ago it was estimated that there were about 3000 cooperative societies of consumers in the United States. The estimate is now about 2000, but membership, turnover and solidarity of organization have increased. About half of the societies operate general merchandise stores in small towns; some 400 are groceries and some 500 oil and gasoline associations; the rest may be divided among restaurants, bakeries, apartment houses, creameries, coal companies, etc.

In Canada as in the United States consumers' cooperation has made a belated appearance. It is represented by the Co-operative Union of Canada, to which are affiliated 31 societies, as compared to 7 six years ago. These comprise about 10,000 members. The oldest of these societies and the most successful is the British Canadian Co-operative Society of Sydney Mines, Nova Scotia, with about 3500 members, doing a business of \$1,780,000 a year.

ALBERT SONNICHSEN

Credit Cooperation. In marked contrast to the development of credit cooperation for agricultural producers on the continent of Europe the movement in the United States and Canada thus far is almost exclusively urban and credit is mainly used for direct consumption needs. The cooperative credit associations are of two kinds: building and loan associations and credit unions. If the former are accepted as co-operative credit institutions their widespread existence and large funds make the United States from the point of view of assets one of the leading countries of the world in the field of credit cooperation. The highly specialized function of these associations and certain variations from the usual cooperative type have, however, led to a separate classification of these associations.

The credit union is a variant of the "people's," or "popular," bank on the continent, particularly in Germany and Italy. The founder of credit cooperation in North America, Alphonse Desjardins (1854-1920), called the first cooperative society established on the continent in the province of Quebec in 1900 the Caisse Populaire de Lévis. But the designation "credit union" is most common in the United States and is used in the first cooperative credit law enacted in the United States in 1909 by Massachusetts and in thirty of the thirty-two state enactments on the subject.

On the basis of this legislation a credit union in the United States and Canada may be defined as regards organization and administration as a society organized on the cooperative principle of voting by person rather than by capital share, self-managed by elected officers, receiving its right to operate from the state and functioning under state supervision. Its purpose is to supply its members with a ready system of savings from which they can then borrow at currently fair rates of interest, and net earnings are to be returned to the members as dividends

on their savings. Incidental and auxiliary functions of credit societies are those of education of the membership. Liability is usually limited to the member's share holdings, but generally the matter of individual liability has not been of importance since credit unions in the United States rarely borrow.

Although the movement began in Canada its greatest development has been in the United States. In Canada it has been limited on the whole to the French parishes of the province of Quebec, although favorable legislation has been enacted in Ontario. Its founder was much impressed not only by the basic economic principles of the Raiffeisen movement, which he studied for many years, but also by its religious and moral character and enlisted the active assistance of the French Catholic clergy. In 1929 there existed 168 societies with 41,374 members and assets of about eleven million dollars.

From Canada the movement under Desjardins' leadership spread to a French Catholic parish in New Hampshire. The most significant development has taken place, however, in Massachusetts, in which from 1908 to 1918 experimentation in legislation and administration formed the basis for similar movements elsewhere. The first cooperative credit law was enacted in 1909 under the leadership of Pierre Jay, then bank commissioner of Massachusetts, and Edward A. Filene with the advisory counsel of Desjardins.

The greatest development of the movement has appeared since the formation of the Credit Union National Extension Bureau, organized in 1921 under the initiative of Edward A. Filene and directed by Roy F. Bergengren. Less than 6 percent of the existing organizations were formed prior to 1916, and almost 75 percent were formed from 1925 to 1929.

It has been stated that the credit union movement has progressed more rapidly during the period of its existence in the United States than it has in any other country. In October, 1930, there were about 1500 such societies in existence with an approximate membership of about 300,000 and approximate assets of forty-seven million dollars. Sixty-nine separate types of credit organization have developed, including more than 200 credit unions, to which 40,000 postal employees belong. Of the total membership 40 percent are industrial workers organized in many cases in specific plant societies, 30 percent are employees of the government or of

public utilities, 20 percent are drawn from communities mainly rural, and 5 percent are members in societies organized by labor unions. Membership has been drawn from groups with common bonds of occupation or association and has been made easily available through a weekly membership fee of about twenty-five cents, applied to shares of small denomination. The cost of administrative expense has been unusually low, averaging about 1.79 percent of total loans granted, and losses have been almost nonexistent. One of the largest credit unions in New York, representing 11,000 members with loans aggregating twelve millions, reports a loss of only forty dollars in the fourteen years of its existence. Almost 60 percent of the members are located in Massachusetts and New York—one third in Massachusetts alone. The movement has spread, however, over thirty-two states and has gained considerable strength in the South and in the Middle West.

The extension of the credit system into rural communities is now in process of experimentation. The development of credit unions in North Carolina has been significant but not sufficiently extensive to serve as a basis for prediction, and the few Jewish rural credit unions in New York state were neither typical nor significant. In the existing rural credit unions loans are made primarily for productive purposes and to assist in cooperative buying. At the present time, under the direction of the Credit Union National Extension Bureau, experiments with rural cooperative credit are being developed in communities in Nebraska, Georgia and North Carolina and in several Catholic parishes. Despite the existence of government aid in the form of intermediate credit banks or of marketing cooperation the need for rural cooperative credit persists.

ROY F. BERGENGREN

JAPAN. The cooperative idea has existed in Japan for centuries. As early as 1275 there existed the Mujin or Ko, societies which practised a very interesting sort of cooperative finance, closely resembling in procedure although not in wide range of objects the nineteenth century Starr-Bowkett English building societies. This type of society with manifold outgrowths of later development persists as the most popular system of finance among the poorer people, and it is claimed that there are at present more than one million Mujin societies.

The idea underlying the Mujin became more

elaborate and reached a closer resemblance to the modern credit societies in the Hotokusha, founded in 1843 by the disciples of Ninomiya Sontoku, a great scholar and social worker who particularly stressed the moral and ethical uplift of the members. The Hotokusha resembles in its object and organization the German Raiffeisen credit society, and after the enactment of the co-operative law in 1899 some of the Hotokusha societies were reorganized into modern credit societies, although a great number are still developing on their original lines.

These two were the cooperative types which flourished in Japan until the early part of the nineteenth century, when there appeared several cooperative marketing societies, called Minamishan, owing nothing to western examples. These were organized by farmers, principally by those engaged in cocoon culture, and originally marketed hand reeled silk, but they now deal in machine reeled silk and also undertake cooperatively the actual reeling process. They have grown into powerful marketing organizations with several thousand individual members.

Shortly after contact had been established with western countries various investigators sent abroad acquired knowledge of foreign systems and began to urge upon the government the necessity for fostering cooperation on western lines. As a result and principally at the instance of Viscounts Shinagawa and Hirata the government established in 1900 the German system of agricultural cooperation, and societies were formed all over the country. Since then they have developed to an astonishing degree and there were at the end of 1928 14,171 such societies with 4,157,000 members. An occupational classification of this membership shows 73 percent in agriculture, about 11 percent in commerce, about 5 percent in industry, 1 percent in fishery and about 10 percent in miscellaneous occupations. Most of these societies perform several functions. Thus although of this total only 2600, or 18 percent, of the societies are listed as strictly credit societies, actually 12,349, or 88 percent, include credit facilities among other functions. Similarly of the total 8148, or 57 percent, have cooperative marketing functions, 10,348, or 73 percent, have purchasing functions and 5069, or 36 percent, provide machinery, plant and other equipment for the common use of their members. Besides the cooperative societies enumerated above there are also 249 urban credit societies and 2431 agricultural warehouses owned and controlled cooperatively.

In 1927 the subscribed share capital of all forms of cooperative societies together amounted to \$133,401,467, paid up capital to \$90,998,745, reserve fund to \$40,827,133 and money borrowed from outside to \$74,071,265.

The internal organization of the credit societies is the same as that of the Raiffeisen societies in that the sphere of a society is limited to a small area, the value of the shares is relatively low, loans are granted for relatively long periods, the posts of directors and auditors are honorary in principle, the working of the society is simple and one or more other forms of cooperation may be combined therewith. Japanese societies have, however, no indivisible reserve fund, limited liability is on the whole preferred to unlimited liability and, finally, the moral aspect is not stressed.

The urban credit cooperatives, far less important than the rural, differ from the latter in several respects. In order to be registered as urban credit societies they must be established in cities or one of the quasi-cities authorized by the minister of state concerned. Since they serve primarily the artisan and tradesman class they may grant loans by way of discounting bills of exchange, a practise not permissible in rural societies. Urban societies have less rigid rules for accepting deposits from non-members. Finally, whereas rural credit societies may include other types of cooperation, the urban credit societies must confine themselves to credit business only.

The total amount of members' deposits and savings in 11,732 credit societies sending in reports was, at the end of 1927, \$445,205,689 and that of loans granted to members \$370,033,834. Taken as a whole the efficiency of credit societies is still relatively low, and in order to fulfil the function of a popular financing system there is much to be done by these societies.

Marketing societies are slow to develop as compared with credit societies. Yet their activities in recent years are noteworthy. At the end of 1927 the total amount of sales in 7513 reporting societies was \$110,727,236. The most important marketing societies are those for silk and rice, the latter product being handled also by the agricultural warehouses mentioned above. Purchasing societies for fertilizers and other agricultural requirements are more flourishing than marketing societies and are fast gaining ground. At the end of 1927, 9739 purchasing societies distributed to their members all kinds of agri-

cultural requirements and necessities of life to the amount of \$76,716,586. Machinery societies are more of an adjunct of other forms of cooperation than purchasing and marketing societies are of credit societies. The most prevalent form of machinery societies is found in connection with cocoan culture and silk reeling.

In the period between 1900 and 1930 various federations, which now number 179 and include the National Federation of Purchasing Societies and the National Federation of Silk Marketing Societies, have been formed. These are organized nearly on the same principle as the unit societies, except that in federations no individual members are allowed and unlimited liability is not permissible by law. Central organizations have appeared one after the other in quick succession. The Cooperative Union acts as propaganda and educational headquarters for all cooperative societies. The Central Cooperative Bank, functioning as the central financing institution for the whole movement, has something of the nature of a state bank, the government contributing one half of the total subscribed capital of \$15,000,000 and its president being nominated by the government. More recently a cooperative college has been opened under the auspices of the Cooperative Union. Japanese success in agricultural cooperation can thus favorably compare with that of many European countries.

This widespread and closely organized farmers' cooperative movement has three special characteristics. In the first place, it is a system that has been established from above by the government, which has financed it by tax remittances and by loans at low interest. The government therefore has been able to control the movement, and the closest supervision has been made possible by the prefectural system established in Japan shortly after the Meiji restoration. The whole system thus evolved is an importation en bloc of the German system, and hardly any attempt was made to integrate the indigenous system with it. At the time of its establishment the attempts that the people had already made at real self-help were virtually ignored. Recently, however, efforts have been made without great success by individual leaders of the movement to give it a character of self-help. A second feature is the exclusion by the government from the cooperative program of the workers' productive societies or self-governing workshops on the French model because it fears that such organizations constitute the first step

toward socialism. The third feature of this system is that the consumers' interests are the least considered. The government wished particularly to encourage the small rice cultivators and incidentally the artisans, but it has ignored the consumers' movement, which is partly responsible for the relatively slow progress of the cooperative store movement.

The cooperative store movement actually began in 1879. For the next ten years beyond spasmodic efforts there was relatively little activity of any importance with the exception of the foundation of the Kyodokai, which was organized in 1901 by lower civil servants attached to the house of representatives and other government departments. After the World War real working class stores came into existence. At the present time there are some thirty such stores, mostly in Tokyo, grouped rather loosely into two federations with about 3000 individual members each.

There are now in Japan about 150 cooperative stores with 125,000 members, doing business to the amount of \$10,000,000 per annum. The stores can be roughly divided into four classes. The first class includes general stores; that is, those open to all classes and existing simply to obtain good articles at low prices. Their members are mostly non-manual salaried employees. The second class includes the workers' stores, which have ideals of social betterment of their members. Some of them have socialistic political affiliations, although this is not openly admitted. The third class is composed of welfare societies set up by industrial and commercial concerns and by government departments for employees; in these, of course, the initiative comes from outside the movement. Finally, there are the students' stores in various colleges and universities, whose purpose is to reduce school expenses and give a cooperative training to the citizens of the future.

The main weaknesses of the consumers' movement are the lack of coordination between individual stores, the lack of experienced sales managers among those responsible for the administration of stores, the continued existence of the system of credit purchase and house to house delivery and the lack of consciousness on the part of the public of the full implications of membership in cooperative stores.

There are two other forms of consumers' cooperation—building societies organized as such and building societies organized as credit societies. There are about 2700 of these societies

with approximately 59,000 members. Yet another form of consumers' cooperation consists of the associations for providing services or appliances necessary for domestic economy. The most important of these are societies to supply electric power, which numbered fifty-three at the end of 1925.

COOPERATIVE PUBLIC BOARDS. Besides the ordinary distributive societies organized by individual consumers there have existed for a long time in Belgium large cooperative organizations among public bodies, such as national, provincial or municipal governments, or bodies having a standing in public law. These are called cooperative public boards (*régies coopératives*) and like ordinary consumers' cooperative share societies are unlimited as to capital and membership. Their membership consists only of the public bodies which are direct or indirect consumers of their products or services. Every such board is open to any public organization which wishes to join it. Legally and in actual practise they are quite independent of their shareholders, the public corporations, in respect to commercial, financial and administrative action. According to their statutes they keep their own

profits and bear their own deficits. In this the cooperative public boards differ essentially from municipal or state boards. It is this freedom from all political influence which has assured the extraordinary success of all the cooperative boards thus far established. In accordance with the fundamental principle of cooperation every such board distributes the profits among the consumers in proportion to their purchases, when these are known, or else turns the entire profits into the reserve fund. The cooperative public board is then a type of distributive society, since it has all the characteristics of such organizations.

There are already a number of cooperative public boards in Belgium. Among the most important of these is the Crédit Communal de Belgique, founded in 1860, a bank which in issuing bonds of a uniform type to the public furnishes capital to Belgian municipal boards at cost price. Between 1918 and 1926 it advanced three billion Belgian francs to cities. The Société Nationale des Chemins de Fer Vicinaux (1884) has constructed and run the 5000 kilometers of branch railroads in the country, of which the receipts were 380,000,000 francs in 1927. The Société Nationale des Distributions d'Eau, founded in 1924 and capitalized at 120,000,000 francs, supplies drinking water to the large urban centers and to several rural communities. The Société Nationale des Habitations et Logements à Bon Marché, founded in 1920, is in the process of building tens of thousands of dwellings which the Belgian people still need. More than 650,000,000 francs have been invested in new real estate. There is also the Société Mutuelle des Administrations Publiques pour l'Assurance contre l'Incendie, la Foudre et les Explosions (1919). A cooperative public board, L'Énergie Électrique de la Moyenne Dordogne, has just been organized in France for the purpose of harnessing the powerful current of the Dordogne River.

These boards combining the vast financial resources of public corporations with the free action and commercial responsibility of a private enterprise are a form of compromise between the capitalist system and the alternatives suggested by either socialism or syndicalism. They demonstrate that socialization is possible without the assumption of economic functions by the state. This form of organization in fact has the merit of employing the capitalistic technique of production for the sole purpose of serving the public, without any violation of those

essential demands for labor voiced by syndicalism.

COPERNICUS, NICHOLAS (1473-1543), Polish astronomer. The theory that the earth moves, widely advanced since the fourteenth century, formulated by Copernicus and driven home by Bruno, Kepler and Galileo, stood for a revolution in intellectual method and interests extending far beyond astronomy. It meant for scientific procedure a definite break not only with all authoritarianism but also with superficial observation and common sense as well. Henceforth nature was considered a simple and uniform mathematical order; all observation must be corrected by reason operating demonstratively by mathematical calculation. For two centuries the net result of this Copernican revolution was to discredit sense observation and establish rationalism as the only respectable method in both natural and social science. "What the mere sense of sight gives us is nothing compared to the wonders the reason of the scientist discovers in the heavens" (Galileo, *Opere*, ed. by E. Alhèri, 16 vols., Florence 1842-56, vol. ii, p. 45). Moreover, the whole impact of this revolution was humanistic. Although the earth had been the center of the universe its rank had been lowest of all; it was imperfect and mutable, the heavens perfect and changeless. Far from lessening the dignity of man, Copernicus for the first time made the earth and man's interests central in value. "We are ennobling and perfecting the earth by making it like the heavenly bodies, and in a manner placing it in Heaven" (Galileo, *Opere*, vol. i, p. 44). This was the real break with tradition. Practical science and social concerns were now as important as heavenly things, as theology and contemplation. Men were free to erect a naturalistic, rationalistic social science. The first thoroughgoing attempt to apply the new science to social affairs was made by Thomas Hobbes.

Copernicus also wrote on currency reform in his *Monetae cudendae ratio*, composed in 1526.

He demands pure coinage of full weight and monetary unity throughout the state. There may be found in his writings the germ of what has since become known as Gresham's law.

COPELSTON, EDWARD (1776-1849), English theologian and political economist. He had a distinguished career at Oxford and advanced rapidly in the church; in 1827 he was appointed bishop of Llandaff and dean of St Paul's. Although chiefly known as a theologian he had a keen mind for controversy and was alert on fiscal and social questions of the day. His economic writings consist of a flowery essay, "On Agriculture," written in 1796 (in *Oxford English Prize Essays*, Oxford 1830, p. 1-27), two open letters on currency and pauperism addressed to Robert Peel, member of Parliament for the University of Oxford; and an article on the "State of the Currency" in the *Quarterly Review* (vol. xxvii, 1822, p. 230-67). In the first *Letter to the Right Hon. Robert Peel . . . on the Pernicious Effects of a Variable Standard of Value, Especially As It Regards the Condition of the Lower Orders and the Poor Laws* (Oxford 1819) he made a sound analysis of the causes and evils of depreciated currency. He attributed the hardships of agricultural laborers and the institution of the English Poor Laws to the long continued rise in prices and demanded removal of "artificial" depreciation by resumption of redemption in specie. In *A Second Letter to the Right Hon. Robert Peel . . . on the Causes of the Increase of Pauperism, and on the Poor Laws* (Oxford 1819) he surveyed the means whereby return to normal currency and lower prices could be accomplished with greatest equity for all classes. Suspicious of legal aid for particular interests he opposed poor laws as "encroaching and unsatisfactory," corn laws as a form of special protection to agriculture and irredeemable paper as a concession to the mercantile classes. His solu-

tion was the issue of paper redeemable according to the currency principle, payment of higher wages and provision of useful work for the unemployed and removal of the corn laws. In his article in the *Quarterly Review* he again maintained the paramount importance of convertibility at the will of the holder of currency.

COPYRIGHT is the exclusive right secured by law to an author or his assigns to multiply and dispose of copies of an intellectual or artistic creation whether by mechanical reproduction or public presentation. The social interest in copyright lies in the adjustment of two objectives: the encouraging of individuals to intellectual labor by assuring them of just rewards and the securing to society of the largest benefits from their products. The history of the concept reflects our progress in mechanical communication, our ideas of property and the functions of the state and our changing social ethics.

The first recognition of literary property was in Rome under the empire when the important manuscript book publishers paid authors for the right to duplicate and sell their works. Although no imperial act or provision in Roman law protected these copyrights, trade usage stopped infringement upon a bookseller's right in a work transferred to him. Such an arrangement may be called guild or trade copyright.

During the early Middle Ages literature was produced in the monasteries and schools of the Catholic church; but books were composed and classics copied not for profit but for the glory of God and the church, and the freer diffusion of religious truth the greater the glory. Author or scribe enjoyed no property right although sometimes he was granted certain institutional privileges or exemptions. Some monasteries established a kind of copyright in rare or authentic manuscripts and allowed copies to be made for a fee or in exchange for other books. This represented a second step in the development of copyright—institutional copyright.

Institutional copyright was perfected in the newly arising universities of Bologna, Padua, Paris, Heidelberg and Oxford. Beginning at Bologna in 1190 two ideas developed. The *stationarius* was established as a recognized university official to provide and rent to students or instructors authorized and verified texts, the prices and rules being established by the uni-

versity. Next came the *librarii*, who sold instead of renting and grew into guilds of booksellers with a very substantial monopoly of the trade of making and selling books. In Paris the *libraires jurés* were controlled by both university and town to assure students correct texts at moderate prices and protection against heretical writings. This meant censorship and trade regulation in exchange for copyrights; but the restrictions were offset by municipal privileges and exemptions with regard to tax paying and military service. The university guilds of booksellers endured through the seventeenth century. They protected literary property rights through registration of title and through trade rules enforced by the guild masters against piracy. They became book publishers of the university towns; and they spread to other towns which were now interested in books, and where they were protected by the towns and by leaders of the church and state. It is to be noted that with this development the ideas of both institutional and guild copyrights were established; that the principle of censorship over book publishing was advanced; and that the book publisher and not the author was protected, presumably on the view that the publisher risked real money and expended physical labor.

The invention of printing in about 1450 revolutionized the ideas on copyright. Cheap duplication immensely enlarged the reading audience, and the author's rewards increased so vastly that he had a new pecuniary interest in his copyright. The state or crown as its power grew asserted the prerogative to control printing by issuing patents or privileges to individuals or by organizing companies of publishers with monopoly rights. The purposes were in part to be able to censor heresy or sedition, in part to foster literature by protecting publishers against piracy. In Venice the Council of Ten during the period 1469-1517 granted privileges for printing books, for an author's copyright, for a publisher's copyright and for outlawing imported books. The principle of a limited term of protection—usually for fourteen years—with a right of renewal was first introduced at this time but was not definitely adopted until the Act of Anne in 1710. In England royal grants were made to favored printers; in 1556 the Star Chamber under Queen Mary incorporated ninety-seven printers, booksellers and stationers in the Stationers' Company, and this act was followed by others elaborating its provisions. Presses and books were licensed and other persons for-

bidden to print any book at all. Registration with the company established copyright *prima facie*. Other legal action was unnecessary since the company had powers to punish illegal publishing, first as piracy and second as unlicensed printing. This licensing system endured with various changes until 1694.

Meanwhile, in contradistinction to this concept of state born monopolies to printer publishers, there arose the novel idea that an author had a common law claim to his own intellectual creations before and after publication. The royal patents, for example, recognized individual rather than guild rights and were often granted with acknowledgment that time and money had produced the literary property so protected. Authors prospered and became class conscious and set up the idea of personal versus institutional literature. They claimed their works were private property, produced by arduous labor, in which they enjoyed perpetual rights. In Venice by 1545 the printer had to present to the university commissioners of Padua documentary proof of the author's consent to publication; in England a licensing act in 1643, supplemented by a series of subsequent enactments (especially 13 & 14 Car. II, c. 33, 1662), prohibited printing any work without the author's sanction. Thereafter the lapse of the licensing system and the confusion between the idea of a state grant and property at common law resulted in such confusion with widespread piracy that authors and printers demanded new formal protection, a statute against piracy and recognition of registration at Stationers' Hall.

In 1710 they secured the first copyright law the world had known, the Act of Anne (8 Anne c. 19). It granted copyright for fourteen years with a renewal for fourteen years during the lifetime of the author, required registration at Stationers' Hall but allowed others than members to register titles, demanded the deposit of certain copies (for the king's library and certain universities) and required copyright notice to be printed in the book. These are the roots of modern copyright legislation. By 1774, after long litigation, authors found (by *Donaldsons v. Becket et al.*, 4 Burr. 2408) that they had exchanged a common law right in perpetuity for a statutory protection of limited term. Then and since authors have sought to reestablish their perpetual rights, but the law has granted these only for unpublished work. Publication implies impact on society and society asserts its social interest by statutory regulation. The continent

was about a hundred years behind England in recognizing the author's individual interest in his productions. Italy recognized the change about 1780 and France at the time of the revolution. Before this time copyright in these countries was based on guild control of publishers, royal patents, trade agreements and municipal regulation. Since 1800 the basic principles of Anne's Act have been perfected and codified; protection has been extended to dramatic, musical and art forms; the term of the right has been lengthened; and the new mechanical methods of reproduction (the phonograph, music players, the cinema and the radio) have been covered.

The increase of intercourse and communication between modern nations revealed the need of an agreement to stop international piracy. In each country the native author needed protection against infringement on his rights by smuggled copies and some method of protecting his works in other countries. France in 1793 gave equal protection to resident and non-resident authors; Prussia in 1837 preserved the rights of authors of other nations that granted reciprocal guaranties; in 1838 Great Britain by orders in council provided for similar reciprocal agreements. As these reciprocal treaties became general the idea developed that both cultural and private ends could be served by one common international agreement. Thus the International Copyright Union was formed, based on the Berne Convention of 1886, the Berlin Convention in 1908, the Protocol of 1914 and the proposed revision formulated at Rome in 1928.

The union is the climax of social wisdom in respect to copyright in its recognition of the international character of letters and art and of the just claims of the individual creator. The provisions of international copyright under it are generous and sweeping. First publication in a member country of the union automatically secures a copyright in all others either for the life of the author plus fifty years or for the term of years legal in the particular country, with all the rights granted its nationals plus special rights under the convention without respect to the terms of protection in the country of origin. No formality is required, the appearance of the name of the author (or publisher) on the work being an evidence of the proper right. It is even provided that authors from non-member nations who secure first or simultaneous publication in any member country enjoy there the rights of nationals and union rights in all other

countries. Through this backdoor privilege authors in the United States—which does not belong to the union—now are able to secure international copyright.

The United States protects the works of its authors in other countries, or those of foreign authors here, by reciprocal treaties. Until 1891 American citizens and residents only were granted copyright in the United States—a condition which caused great friction, for works of foreign origin were reproduced at will without payment. This was especially true of works of English authors, since the common language made them profitable, although reputable American publishers did share with the authors the profits from American editions. The present law, passed in 1909, grants copyright to foreign authors when domiciled here, when their country grants reciprocal protection equal to that of this act or when the country is a member of an international agreement for reciprocity. The rules of registration, deposit of copies and printed notice on the article must be complied with. Since 1891 the American law has required American manufacture of works in English, e.g. the type must be set, plates and illustrations made, printing and binding performed, within the United States. The purpose is to protect the bookmaking industry, but it is doubtful whether this clause has been of any great value to the industry. It confuses trade protection and labor legislation with cultural and educational interests. At hearings on the proposed revision of the act (Vestal Bill, 1926) the labor group was willing to modify the manufacture clause to permit the United States to adhere to the International Copyright Union convention. The bill was not passed but there are grounds for believing that such legislation will pass in the not distant future. Our self-interest now coincides with the demands of justice, since it becomes increasingly important that the United States secure protection for growing exports of films, books and music records.

The Russian Soviet experiment has modified certain of the concepts of national and international copyright generally accepted by other modern nations. The doctrines of state communism, the limitation of property rights and private enterprise and the establishment of a special status for labor have all influenced Russian copyright legislation. The publishing and distribution of books throughout Russia is largely in the hands of the government. The State Publishing House (*Gosizdat*) is the largest

in the world. Few private, book publishers or sellers exist, and these are rigidly supervised. The decree of January 30, 1925, of the Central Executive Committee of the Union of Socialist Soviet Republics, adopted by the Council of the People's Commissars of the Russian Socialist Federated Soviet Republics on October 11, 1926, and supplemented by a new decree of the Central Executive Committee on May 16, 1928, grants protection to a citizen of Russia in that nation for his productions regardless of their place of publication. Foreign authors are granted copyright for works published in the Soviet Union but can receive protection for work published in another country only where reciprocal agreements exist with that country. The term under the first decree was twenty-five years, changed by the second one to the life of the author and fifteen additional years for his heirs, with various terms (five or ten years) for special forms like motion pictures, photographs and periodicals. The theory of the indivisibility of copyright is firmly maintained. Publishers are forbidden to change the work or title or to supply illustrations without the consent of the author. Certain rights in copyrighted material are excepted with a view to what the Russian government considers cultural or educational purposes. The decrees further provide that copyright may in all cases be compulsorily purchased by the Soviet Union or by the constituent republic where the work was first published, with adequate compensation as determined by the People's Commissars. The whole field of translation can be declared a state monopoly. All this represents the interesting situation of a return to the sixteenth century conception of the state control of printing. The actual practises under these various clauses are too complex to be covered here.

The recent development of radio broadcasting has introduced problems not incomparable to the revolutionary ones consequent to the invention of printing. Can the holder of a copyright control the broadcasting of musical, dramatic or literary works and require payment from the broadcaster? The weight of present opinion is that adequate protection of the author's right is given by the Act of 1909 (section 1, a, c, d, e) and by decisions of federal courts. The Supreme Court has held that the owner of a copyright has exclusive right to use or license the use of his work for performance for a profit and that since radio broadcasting is a public performance for profit the broadcasting agent must pay a royalty

for the use of such works. The purchase of a printed or published musical or other work does not carry with it the right of performance as often and before as large or small an audience as may be desired unless the performance falls under section 28 on educational or charitable performances. The stations have contended that their broadcasts are not for profit, but education, since they collect no fees from the listeners. Their profits from advertising programs would seem to contradict this. The present trend to extend copyright protection in this and other new fields, such as television, is shown by the following proposals. In the Vestal Bill (March 17, 1926), which was not passed, appeared the clause: "To grant to the copyright proprietor exclusive rights to communicate the work to the public by radio broadcasting, telephoning, telegraphing, or by any other means for transmitting sounds, words, images, or pictures." The proposed convention for the International Copyright Union, Rome, 1928 (English translation: Library of Congress, Register of Copyrights, *Report . . . 1928*, Washington 1928), adds section 11 bis: "The authors of literary and artistic works enjoy the exclusive right to authorize the communication of their works to the public by radio diffusion." The same code protects the "moral right" of the author against any corruption of the form in which he has issued the work. This final triumphant assertion of the right to the creator of any intellectual or artistic work to control its form and its diffusion by every possible means of communication rounds out the long struggle for a true copyright.

COQUELIN, CHARLES (1803-52), French publicist and economist. After completing his law studies in Paris Coquelin practised for a few years in his native city of Dunkirk, but his growing interests in political economy prompted him in 1832 to return to Paris and enter upon the uncertain career of a journalist. Coquelin's contributions, covering a wide range of economic subjects, began to appear first in the *Temps* and were continued during the course of the next twenty years in the *Monde*, the *Droit*, the *Revue des deux mondes*, the *Revue de Paris* and the *Journal des économistes*. These articles, especially those dealing with banks, commercial associations, tariffs and labor, established his reputation as one of the outstanding leaders among contemporary economic liberals. He was called upon in 1851 to assume with Guillaumin the editorship of the *Dictionnaire de l'économie politique*, the first work of its kind in the French language. As editor and as contributor of important articles Coquelin was instrumental in making of the work a coherent and unified expression of the liberal ideas then dominant. Although in general he was seldom more than an able publicist with slight doctrinal influence, his ideas were widely circulated during his lifetime. His study of credit and banks, *Le crédit et les banques*, which advocated a free banking system, ran through several editions and exerted a strong influence on the American economist Henry C. Carey. As secretary of the Association pour la Liberté des Échanges Coquelin took an active part in the agitation for free trade. His zeal for economic liberty led him also to attack the existing restrictions on free commercial association as well as any manifestations of socialism or organizations tending to interfere with freedom of labor.

COQUILLE, GUY (1523-1603), French jurist. He was one of the stars, and not the least brilliant, in that remarkable *pléiade* of juriconsults which France produced in the sixteenth century. But with excessive modesty he had early formed

the resolution to pass his life in his native province, Nivernais, after study in Italy and at Orléans. In the Estates General he participated in the political and religious struggles of his time. His opinions were moderate and in favor of the Gallican doctrine as against the ultramontanists and of a limited monarchy as against the League. His views are expressed in his singularly penetrating and almost prophetic *Traité des libertés de l'église de France* (1594) and his *Discours . . . contre les bulles . . . Gregoire XIV contre la France en 1591*. In contending that it is the people who make the law he expressed a theory very close to that of national sovereignty. Among laws he distinguished two kinds; those which are simply published and registered in the Parlement and the others, which he calls "fundamental" (we should say constitutional) and which are created in the Estates General. He was no less original in private law. With Dumoulin, d'Argentre and Loisel he was one of a remarkable group of jurists who worked on the French customs after their redaction and created a veritable *droit commun coutumier*. Coquille considered the customary law equal if not superior to the Roman law, and he gave a remarkable description of that of his own province in his celebrated *Les coutumes . . . de Nivernois*. But the diversity of the customs appeared to him intolerable. He worked for their unification, especially in his notable work *Institution au droit françois*, which makes him one of the first generalizers of French law. The best editions of Coquille's works are in two volumes (Paris 1665; new ed. Bordeaux 1703).

CORN LAWS. Although restrictions and tariffs on the export and import of cereals have always been common to many countries, it is perhaps only in Great Britain that they have ever been the cause of a political controversy so bitter as to threaten revolution before their complete and peaceful abolition.

The earlier corn laws of England were aimed mainly at preventing exports. Thus in 1194 an edict was issued forbidding the export of corn (grain, sometimes specifically wheat) or any

kind of victual in order "that England might not suffer from the want of its own abundance." Evidently the order was ineffectual, for in 1339 an act was passed ordering "that no corn be exported till further ordinance be made therein."

By that date parliamentary government had begun, and kings were forbidden to levy taxes "save by the consent of the Common Council of the realm." This condition the kings constantly tried to evade, and among other expedients they appear to have granted licenses to export corn on payment of what amounted to bribes. The first indication of a change in national policy was a general leave to export, granted in 1394 on account of the low price of corn. In 1463 the Hanse merchants were found to be importing corn and were forbidden to do so when the price of wheat was less than six and eight pence a quarter.

It was not, however, until the time of the Tudors that the price of corn became a notorious hardship. With the influx of precious metals from the New World and the debasement of the coinage by Henry VIII prices rose beyond all precedent, while the regulation of wages under the statutes of laborers prevented a corresponding increase in the reward of labor. Under Mary and Elizabeth export was again prohibited, and it was not until the reign of Charles II that Parliament gave serious attention to keeping corn prices up by the restriction of imports. In 1670 an import duty of 16/- a quarter was imposed when wheat did not exceed 53/4, 8/- when wheat was priced between 53/4 and 80/- and 4/- when the price was above 80/-; while export restrictions were abolished.

During the greater part of the eighteenth century, according to Thorold Rogers, the corn laws were inoperative as far as consumers were concerned. Until the outbreak of the French Revolution the tendency, at least, was toward a liberal policy; indeed, from 1774 to 1791 only a nominal duty of 6d a quarter was imposed on imported corn.

During the revolutionary wars the corn taxes, far from being inoperative, became a terrible instrument of oppression, threatening revolution and leading to that practical alliance of the new industrialists and the working classes which was to be the basis of Victorian liberalism. The industrial revolution had created a new manufacturing class, particularly in textiles, which was increasing the powers of production far more rapidly than it was possible for an underpaid

proletariat, compelled to spend nearly all its wages on bread, to increase its power to purchase industrial products. To aggravate the matter, dependence on the uncertain climate of Britain, at a time when any partial or complete failure of the home harvest made foreign supplies of corn necessary, resulted in price fluctuations ruinous both to the poor and to industry. From 1773 to 1793 the average price of wheat was only £2.6.3; in 1801, with the new duty of 24/3, it rose to the famine rate of £5.19.6. Two years after, with a more abundant harvest, wheat had fallen to £2.18.10 during the short peace of Amiens; in 1814, after much higher prices, it fell to £2.15.8.

With the coming of peace a collapse of corn prices was inevitable, and with this collapse either a great reduction of agricultural rents or the ruin of the tenant farmers. Under the stimulus of inflated prices much land, good for pasture but not suited to corn growing, had been brought under the plow. With the drop in prices much of this land became "uneconomic," and even the rents of the best corn land had to come down under the competition of free imports. The Parliament of 1814, dominated by landowners, prohibited the import of corn unless the price exceeded 80/- a quarter.

This law was revised in 1822 and in 1828 was enacted the famous "sliding scale," the heart of the subsequent bitter contest. The duties were fixed at 23/- a quarter when corn was 64/- or under, at 16/8 from that price to 69/- and at 1/- when the price exceeded 73/-.

Thus far the landed interest had its own way. Economists were, however, undermining their theoretical position although they were guarded in the proposals for dealing with the actual situation. Ricardo, after contending that the public would lose more than the farmers would gain by a tax on corn, advocated an import duty adequate to equalize the special imposts on home agriculture, viz. tithe and poor rate. Malthus, stating the strength of the free trade case, feared the return of famine prices in the event of another war if the country became dependent on foreign corn.

Free trade ideas were now beginning to influence statesmen. The commercial treaty which Pitt made with France in 1786 was the result of his reading the *Wealth of Nations*, and although the war drove him back to protection his ideas continued to influence the younger Tory statesmen, notably Huskisson and Canning. Huskisson in 1825-26 made great reductions in the tariff, carrying reform further than Pitt himself.

In the thirties Sydenham made further reductions. Before Peel returned to office in 1841 the free traders in the House of Commons had succeeded in getting a commission appointed to inquire into the workings of the tariff. The chairman was Joseph Hume, himself a free trader. The report of the commission in 1840 destroyed all faith in the value of protection as an instrument for raising revenue: out of a total of £22,122,000 customs revenue derived from 862 dutiable articles no less than £18,550,000 came from nine articles, most of which did not compete with home produce. That is to say, the bulk of the revenue was not protective. Although pledged to maintain the corn law, Peel nevertheless swept away the duties on 750 articles and aroused suspicion among his protectionist followers when at the outset of the new Parliament he said: "If I thought that the repeal of the Corn Laws could be an effectual remedy for the distress of the manufacturing districts, the recital of which has caused me much pain, I should recommend it as essential to the welfare of the agriculturalists themselves; but I cannot come to that conclusion."

Meantime the business world was becoming converted to free trade. Frequent and terrible trade depressions, which occurred whenever harvest failed and bread was dear and during which factories were closed and their owners driven into bankruptcy, compelled manufacturers to realize that their prosperity absolutely depended upon a steady and moderate price of corn, on the margin left over in the average household after the necessary food had been paid for.

The laboring classes needed no conversion to free trade ideas; all records indicate their appalling misery during the first half of the nineteenth century. A selection of letters written by aged survivors of the "Hungry Forties" published in 1904 reveal what a nightmare the memory of the sufferings of their youth was to the grandparents of Edwardian England. It is certain that, helpless and voiceless as they were, the British working classes hated the "hunger tax" from the first.

In the face of these forces it was impossible to keep the tariff on corn "out of politics," but official circles were loath to face the prospect of abolition. The landowners still held the great majority of the seats in Parliament, and the Whigs were just as much opposed to such radicalism as the Tories. Political discussions turned on the respective merits of a fixed duty

of 8/- as opposed to the existing sliding scale. When economists, theoretically opposed to protection, were willing to compromise, it is not wonderful that statesmen hesitated. The Whigs fought the election of 1841 committed to the fixed duty; the compromise was uninspiring and they were defeated. It is impossible to say how long the controversy would have remained unsettled had not a new force come into action.

Manchester was the natural headquarters of opposition to the corn laws. Lancashire, perhaps more than any other district, had suffered from the poverty they caused. Lancashire's staple, cotton, was the most common basis of workers' clothing at that time and was hence more than other industries dependent on the margin left of working class wages after the necessary food had been bought. Lancashire manufacturers were ruined; Lancashire workmen were unemployed and starving whenever food prices rose through failure of the British harvest.

The Anti-Corn Law League was the "new model army" and Richard Cobden the Cromwell of the struggle for repeal; neither had any use for drawn battles. From the first the league stood for total repeal and refused either to take subscriptions from those who would accept less or to allow any other question to be confused with that of repeal. The league was an ad hoc organization prepared to sweep aside all party or other considerations tending to confuse the issues. For this purpose immense sums of money were raised, trained lecturers were sent all over the country, millions of leaflets and pamphlets were distributed. The two great leaders of the movement, Cobden, the persuasive reasoner, and John Bright, a master of oratory, addressed enormous meetings in the great centers of population. Candidates pledged to total repeal were run for Parliament, and Cobden was elected member for Stockport in 1842. He was exactly the man to influence the candid mind of Peel, already virtually a free trader as far as other commodities were concerned and apologetic about corn. The fatal rains that ruined the harvest of 1845 convinced the troubled prime minister; Peel resigned and promised the Whig leader, Lord John Russell, to support him if he formed a ministry to abolish the corn laws. Russell failed to do this, and Peel returned to office expressly to carry repeal. By the votes of the Whigs and those members of the Tory party who stood by their leader the corn tax was reduced for the next three years and

abolished, except for a registration duty of 1/- a quarter, in 1849. On the day on which the bill passed the House of Lords the government was defeated in the Commons by a coalition of outraged Tories and factious Whigs on another issue. Peel resigned office and abandoned politics.

In 1862 Robert Lowe removed the remaining shilling tax on imported corn, and save for an interval of one year during the Boer War when the tax was again enforced the import of corn into Great Britain has since been entirely free. But the hatred of such taxes survives. The temporary imposition of the shilling tax in 1902 immediately destroyed the popularity of the Conservative government. From the day of its imposition a long series of by-elections adverse to the government led to its overthrow in 1906. During the long "tariff reform" controversy beginning in 1903 it was the proposed food taxes more than anything else that prevented any possibility of a success for the policies advocated by Joseph Chamberlain and the Tariff Reform League. In 1912 Bonar Law surrendered the food tax part of his program reluctantly, for these taxes were really an essential part of the tariff reform scheme for interimperial preferences.

Food taxes are not uncommon in continental Europe; they have not met there with such determined resistance as in England. In 1911, however, there was a very fierce and widespread agitation, especially in Austria, against them and during the Great War practically every country in Europe, including neutrals, was forced to suspend their operation. But as the growth of population on the continent renders it dependent on overseas supplies, as was England in the forties, it seems likely that the story of the Anti-Corn Law League will be repeated there.

CORNER, SPECULATIVE. A corner may be defined as a plan of manipulation whereby one operator or more secures possession of all or substantially all of a given commodity or of the shares of a given issue of stock available for delivery upon the outstanding contracts of short sellers, in order to compel such sellers to settle at an arbitrary and abnormal settlement price imposed by the operator of the scheme. Such operations are possible only because of the practise of short selling in organized security and produce exchange markets. At times they have been the cause of some of the most disastrous price upheavals in the history of organized markets.

Corners have been numerous in the past, and there is scarcely a year that does not afford an illustration on some one of the nation's major exchanges. In many instances the existence of the corner is beyond dispute. But frequently the situation cannot be judged definitely, the price being apparently an unwarranted one but the manipulative program being so deftly engineered as not to arouse unusual suspicions. Broadly speaking, corners are of two kinds: those which are planned deliberately for the fleecing of shorts and those which are brought about unintentionally through an unavoidable set of circumstances, such as a fight for control of a corporation.

In the first type of corner the operator having acquired control of the particular shares or commodity usually proceeds to induce short sales on the part of unsuspecting speculators by raising the market price, through matched orders or otherwise, to an apparently unwarranted level. All that is sold by such short sellers is purchased by the operator, who knows that delivery cannot be made at the due date because he already owns or controls all that is available for delivery. Every manipulative device is used to keep the true situation secret. In the stock market, for example, short sellers may keep their contracts open only by borrowing the security for fulfilment of delivery on "regular way transactions." The manipulator will therefore camouflage the situation by lending his own stock to the prospective victim freely and on terms so easy as to indicate the existence of a perfectly free continuous market. The shares he lends, however, are of necessity returned to him immediately by the borrowers in fulfilment of the short sales. Finally, when conditions seem ripe for the greatest profit, the manipulator withdraws all of his shares from the market. Those with outstanding

short contracts suddenly discover that no shares are available for borrowing or for purchase. They find themselves "cornered" and can obtain release from their contracts only through a settlement with the manipulator at his own terms. To be successful the manipulators must have sufficient funds or credit to acquire the necessary amount of the shares or commodity and in the case of stocks also to pay for the shares purchased from short sellers.

The famous gold corner of 1869 and the equally famous Leiter corner in wheat in 1898 are outstanding illustrations of the deliberate corner. The first of these corners was operated by a syndicate which after acquiring the apparently available supply of deliverable gold in New York secured additional contracts from short sellers for approximately \$100,000,000. The market quotation was raised to the abnormal figure of 162½, but the nefarious scheme was frustrated by the government's decision to place its own treasury holdings of gold on the market, thus furnishing a supply which the manipulators were unable to finance. The abnormal price broke in a few minutes to 131, and many of the leaders of the scheme were forced into bankruptcy. The Leiter corner represented a control of practically all of the nation's wheat market and proved successful for many months, the price gradually rising from below \$1.00 to \$1.85 in May, the last crop month of the year. The operators, however, had miscalculated in many important respects. More wheat was offered than they had anticipated, and the consuming world also resorted to substitutes and refused to purchase the syndicate's wheat holdings at such abnormal prices. The new crop proved unusually large, and early harvesting was urged as a means of swamping the syndicate. All of these factors combined successfully to break the corner, and bankruptcy was again the penalty for many of the participants.

The Northern Pacific corner of May 9, 1901, furnishes the most notable illustration of the unintentional corner. The Harriman interests were seeking to wrest control of the Northern Pacific Railway from the Hill-Morgan interests. Both groups purchased all the shares available and in the final reckoning controlled between them all but about 10,000 shares of the common stock. Between January 21 and May 9 the price had risen from \$77 to \$160. Many short sellers, unaware of the situation, resisted this abnormal rise with sales and finally found themselves unable to deliver. The price of the stock then rose

to \$1000 a share. To save themselves many who were caught with short sales were obliged to sell their holdings of other stocks. There ensued one of the greatest panics in the history of the New York Stock Exchange.

With respect to produce markets it is important to note another twofold classification of corners: those which involve the actual cornering of the nation's supply of the commodity and those which are operated in some one exchange center only with a view to "squeezing the shorts" by making it impossible for them to deliver on contracts for a particular month. The latter type of corner occurs frequently and as a rule does not affect consumers seriously. The manipulator merely acquires control of the deliverable supply of the commodity in the particular city where the produce exchange is located. He keeps his program secret until near the end of the month. Short sellers for the option for that particular month are obliged to make delivery by the last business day of the month. If they are unable because of lack of time to bring adequate shipments into the city the short sellers are not in a position to meet their commitments and are therefore required to settle their contracts with the manipulator on his own terms.

Corners constitute a menace to speculative markets and do not serve any useful social function. When financed knowingly they represent a misuse of credit funds. They tend to disrupt the machinery of legitimate speculation and cause the greatest injustice to short sellers. Short selling is a vital necessity to any organized market, and the public derives many benefits therefrom. Deliberately to nullify the shorts is nefarious, and the sooner deliberate corners are treated as unsocial acts the better.

There is reason to believe that the practise of operating corners will become less frequent. Repudiation of contracts is already permitted by law in the event of a corner, but that practise is frowned upon in many quarters. By statute law corners have also been declared illegal in certain states, but the difficulty is to prove the existence of a corner. For the most effective remedy we must look to the organized exchanges themselves, all of which are opposed to corners. In produce markets the short seller is usually given the privilege of delivering any one of a considerable number of grades of the commodity, thus making it much harder for the manipulator to acquire the available supply. In other instances, where a corner is known to exist the exchange

can by appropriate action fix a reasonable settlement price. In the stock market, however, this last remedy seems impossible because of the difficulty of fixing a proper price for a given stock. The most wholesome remedy would seem to be the development of a public opinion which visits financial ostracism upon the perpetrator of a corner.

CORONER. The word coroner is derived from the Latin *corona* and signifies an officer of the crown. In the English statutes the incumbent was generally known as the coronator, or coroner, and under Henry VIII as the crowner. The exact origin of the office is unknown. There is some evidence of its existence as early as the tenth century; it is certain, however, that the office was functioning in England during the reign of Richard I. There were and still are four types of coroners in England: the ex officio sovereign coroner, whose office is an adjunct of a judgeship in the high courts; the franchise coroner, whose office is created by charter; the borough coroner, who is found only in boroughs having a separate court of quarter session; and the county coroner, who exercises his jurisdiction in the shire or county.

In the early days great dignity attached to the coroner's office. Primarily he was not to "hear and determine," but to keep records of all matters pertaining to criminal justice within the county. His duties extended to collecting for the king all goods and chattels of criminals, deadlands, treasure troves, shipwrecks and royal fish. He also heard appeals of felony and the confessions and abjurations of felons and kept records at inquests. The county coroners were elected by the legal freeholders, a system which was retained until the enforcement of the Local Government Act of 1888, since which time they have been appointed by the county councils. The Coroners Act of 1887 limited the duties of the coroner to acting as a substitute for the sheriff and to holding inquests for the purpose of determining the cause of violent

and extraordinary deaths. In the Coroners Amendment Act of 1926 an attempt was made to meet modern needs by the stipulation that a coroner must be a barrister, solicitor or physician of five years' standing. The county councils attempt to appoint men with training in both fields.

The coroner system was brought to America by the English settlers in the same form as it existed in England at that time. The functions of the coroner in the United States since 1800 have, however, been largely judicial. The present qualifications of age, citizenship, residence within the county and non-acceptance of incompatible office are the same as in England. In most states the coroner is elected for a term of from two to four years; in several he is appointed, while in others the justices of the peace are empowered to exercise the ordinary duties of the coroner. Only a few states require the coroner to be a licensed physician.

The duties of the coroner are established by statute, and although some states have delegated to him various other functions, his chief function always is to hold inquests. The investigation of deaths involves two tasks. As medical officer the coroner must furnish the state with a definite decision as to the cause of deaths which have occurred under unnatural circumstances; as legal officer, where he believes that there is evidence of a crime, he must summon a jury of six or more men, examine witnesses, seize evidence and aid in the apprehension of the criminal. For criminal action the information must be filed with the courts or prosecuting attorney.

Unfortunately there are few coroners in the United States who have either the necessary legal or medical qualifications. The compensation, which except in a few of the larger cities is on a fee basis, is so low and the honor of being coroner so slight that the office has not attracted capable men. Consequently it is usually held by minor politicians who use it to further their own fortunes rather than to aid the course of justice. For example, the coroner has the right to have an autopsy performed when the circumstances of the death are suspicious; very often, however, he neglects to do so either for a pecuniary consideration or from sheer carelessness. Where the autopsies are performed they are rarely done by physicians specially trained for the work. This results in the obliteration of valuable clues which would readily be detected by an expert. From the

point of view of legal procedure also the system is faulty. The coroner frequently selects a jury from among his friends and in general his ignorance of legal methods makes his inquests valueless. The usual lack of cooperation between the coroner and prosecutor is another factor which makes the office of coroner a deterrent rather than an aid in tracing the criminal.

However adequate the work of the coroner may have proved in earlier times, there is no doubt that the office does not meet modern requirements. Such a system must break down because the training now required is so highly specialized that it becomes increasingly difficult to find anyone for the position who has both the necessary medical and legal qualifications. Accordingly there is a definite trend toward the elimination of the office and the division of the functions of the coroner between a qualified medical examiner and the district attorney. New York City and all the New England states except Connecticut have adopted this scientific and non-political system. In New York and New Jersey it is optional. The Massachusetts statutes require the governor to appoint one or more medical examiners for each county for a term of seven years, with provision for reappointment. In New York the medical examiner is appointed by the mayor and holds his office in permanent tenure. In both states the medical examiner must be a physician and in New York he must also be a skilled pathologist and microscopist. The medical officer is relieved of all legal duties but has the full responsibility for medical examinations and opinions as to the cause of death. All persons who have died under unnatural circumstances must be examined by the medical officer or a member of his staff and complete records of examinations and autopsies kept. Where there is any indication of criminality the records relating to the death are promptly delivered to the appropriate district attorney, upon whom criminal prosecution depends. The medical examiner system places upon men trained for autopsy work the full responsibility for determining the cause of death and upon men of legal training the responsibility for examining witnesses and apprehending criminals. In New York and Boston the salary attached to the medical examiner's office is sufficiently large to attract men of high character and ability. In the counties outside of Boston the compensation is on the fee basis. Despite the obvious advantages of the medical

examiner system, however, most states continue to use some form of the coroner system.

CORPORAL PUNISHMENT. By corporal punishment is meant the legalized infliction of bodily pain by one person on another as a penalty for the violation of certain laws, rules or customs. There are, of course, many instances in which such pain is inflicted without legal sanction or in defiance of the law, but this article is concerned chiefly with those forms of corporal punishment which have either been prescribed by law or permitted under the law: in short, socially sanctioned methods of corporal punishment.

Sex perversions and substitutions have played no small part in the nature and severity of corporal punishment. The sadistic tendencies of man have led some to gain much personal satisfaction from the infliction of hideous punishments on others. The almost fabulous cruelty of the convict overseers in Australasia a century ago affords a good illustration of this situation. Denied most normal outlets these men took a delight in brutally beating those under their control. Fear has also been a decisive factor in provoking corporal punishment. Convict guards and overseers, always in a small minority, have sought to increase their safety through the fear which they believed they could engender by means of brutal and frequent punishment.

As a method of punishing criminals flogging has been from early times one of the most frequently utilized of all types of corporal punishment. It is still legal and frequently employed in Delaware, Canada, Great Britain and some continental and Asiatic lands as a punishment for certain crimes, chiefly assault, robbery and rape. In England as late as 1922 the Court of Criminal Appeal upheld a sentence inflicting punishment by the "cat-o'-nine-tails" for robbery with violence and assault. Where flogging

was forbidden as a method of punishing criminals its use often continued within the prisons. Throughout the nineteenth century prison investigations revealed the scandalous prevalence of flogging as a method of disciplining convicts, and the practise has by no means disappeared. The whipping of men in southern prisons today is as brutal as in the Australian shambles of the last century. The lash is openly administered in Alabama, Louisiana, South Carolina, Arkansas, Mississippi, Tennessee, Texas and Virginia and is used under cover in many northern states. The revival of flogging in the United States is frequently advocated by exponents of severity in dealing with convicts. Before modern methods were introduced it was a common custom to maintain discipline in "lunatic asylums" by cruel floggings of the inmates. The flogging of slaves, children, pupils in schools, soldiers and sailors has been common through the ages, although the severity has varied widely in relation to the age and status of the person flogged. The instruments and methods of flogging have varied greatly. In maintaining discipline in the home sticks, rods, straps, whips and other handy objects have been drafted into service. Rods, straps and whips with a single lash have prevailed in the schools, although more recently short pieces of rubber hose have been utilized. In punishing criminals and in maintaining discipline in the army and navy the lash, with a variety of diabolically ingenious elaborations, has predominated. One of the most popular refinements of brutality with the lash has been the so-called cat-o'-nine-tails, constructed of nine knotted cords or thongs of rawhide attached to a handle. A form of lash still widely used in southern prisons has three broad straps, one of which is equipped with three rows of brass studs. The Russian *kmut* was an instrument constructed of a number of dried and hardened thongs of rawhide interwoven with wire, the wires often being hooked and sharpened on the end so that they would tear the flesh when the blow was delivered. A painful type of flogging used in the Orient was the *bastinado*, or blows delivered upon the soles of the feet with a light rod or a knotted cord or lash. In the period before the reaction set in against corporal punishment flogging was executed with great brutality. The backs of the condemned were frequently cut in strips and blood gushed from their wounds. Not infrequently salt was thrown upon the bleeding backs to increase the pain.

Another type of corporal punishment which

was widely used down to the time of punishment by imprisonment was mutilation. This was early employed in connection with the *lex talionis*, which designated a punishment exactly duplicating the injury originally inflicted. Mutilation as a punishment was also conceived of as a deterrent. Thus the hands of thieves and counterfeiterers were cut off, the tongues of liars and perjurers torn out, the eyes of spies gouged out; those guilty of rape were castrated and women guilty of adultery had their noses cut off or were otherwise disfigured. The pain involved in these mutilations, inflicted as they were without any anaesthetic, was excruciating and loss of blood and infection were likely to produce death in the case of major mutilations. Mutilation continued even in England until after the beginning of the sixteenth century. The cutting off of the ears and hands persisted until the eighteenth century.

Branding has been very generally used as a method of corporal punishment. The Romans branded criminals with some appropriate mark upon the forehead. In France in the later Middle Ages the criminal was branded on the shoulder with the royal emblem, the *fleur-de-lis*. Later this was changed to the initial letter of the particular crime committed. In England wide use was made of branding and it was not abolished until the latter half of the eighteenth century. As late as 1698 it was ordered that criminals should be branded upon the face. The letters used in branding bore at least a rough general resemblance to the nature of the crime committed. Murderers were branded with an M, thieves with a T, vagrants with a V, idlers with an S (meaning slave) and fighters and brawlers with an F. Most widely used was the letter M, meaning malefactor. Branding was also common in American colonial jurisprudence and criminal procedure. Closely associated with branding was the piercing of the tongue with a hot iron. This punishment was particularly popular for such offenses as lying, perjury and blasphemy.

The use of the stocks and pillory was extremely widespread as a method of corporal punishment, particularly in early modern times. The pillory was not abolished in England until 1837. When it was employed in a simple fashion and not accompanied by any other mode of punishment it was designed to bring about a feeling of humiliation attendant upon the infliction of public disgrace. But the stocks and pillory were very rarely utilized merely as a method of confining a person in public and ex-

posing him to the contempt of his fellow citizens. The confinement was very frequently supplemented by making the person thus detained a target for decayed vegetables, rotten eggs and even stones; occasionally persons in the stocks and pillory were pelted to death. It was a very common custom to nail to the beams of the pillory the ears of the persons confined in such a manner that when they were released they would be compelled either to tear their ears loose from the nails or have them carelessly cut away by the officer in charge. The "Spanish mantle," a barrel with a hole for the head and arms, was also used as a humiliating device which the prisoner was compelled to wear while being marched through the streets subject to the derision of the onlookers. Other devices were an iron frame fastened about the body, iron masks and cage-like helmets. Prisoners were frequently confined by joughs, or iron collars attached to a wall or post.

The ducking stool was a well known expedient employed as a form of corporal punishment for lesser crimes, particularly in the punishment of scolds and gossips. The culprit was strapped to a chair fastened to a long lever and was submerged in the water of a stream or pond at the pleasure of the operator in the sight of jeering crowds.

The first vigorous movement to put an end to corporal punishment for crime was launched by the Quakers toward the close of the eighteenth century. In Europe they could not bring about any effective reform, but in America they abolished corporal punishment in 1681 in West Jersey and in Pennsylvania in 1682-83. In its place they prescribed imprisonment and fines. This Quaker innovation gained little headway for a century, but after the American Revolution imprisonment soon came to be the accepted method of punishment in this country. Similar reforms followed in the various European countries. In the nineteenth century there was but little legalized corporal punishment for crime in the western world. The main argument against corporal punishment for crime has been its pain and brutality. There is no doubt that severe corporal punishment brutalizes not only the victim but the person who executes the punishment and the spectators, awakening sadistic tendencies and demoralizing the finer sensibilities. It is largely due to a recognition of this fact that public floggings have been abolished.

Corporal punishment of the insane and

feeble-minded has been abandoned in keeping with the progress of knowledge of the nature of insanity and mental defects. As long as insanity was looked upon as mere perversity it was believed that by severe flogging one could produce fear and enforce discipline. Now that the responsibility of the insane person and the feeble-minded has been thoroughly established the flogging of these types appears as illogical as it is cruel.

The gradual abandonment of corporal punishment in the school and home has been the result of the advancement of psychological knowledge and the improvement in general culture. Modern psychology, especially educational and behavioristic psychology and psychiatry, has shown the very real dangers to personality development which lie in corporal punishment. Deep seated hatreds may be instilled. Powerful resentments may be built up. Both of these may recede into the unconscious and constitute the basis of personality difficulties and complexes of a serious nature. The use of corporal punishment as a general method of preserving discipline is condemned by modern pedagogy and psychology without reservation and is tabued by contemporary humanitarianism.

CORPORATION. A corporation is a form of organization which enables a group of individuals to act under a common name in carrying on one or more related enterprises, holding and managing property and distributing the profits or beneficial interests in such enterprises or property among the associates. Its structure is defined and sanctioned by a statute, charter or certificate granted by the state; its shares are transferable; its life is independent of the lives of the individuals; and its debts do not usually create a liability for the latter. Although the most familiar type is that engaged in business activities, corporations may also be the vehicle for carrying on charitable enterprises (*see* CHARITABLE TRUSTS; ENDOWMENTS AND FOUNDATIONS), cooperative non-profit enterprises, municipal and governmental operations (*see* MUNICIPAL CORPORATION; GOVERNMENT CORPORATIONS) and religious and social activities.

The corporation is of unknown antiquity. Under Roman law bodies corporate possessing common treasuries and legal personality separate and distinct from that of the individuals comprising them were well known. Such were, for example, the various municipal, religious, industrial and trading associations called *universitates*. The organization of such associations was practically uncontrolled under the republic; the requirement that all such corporations must have a license from the state dates from the empire, probably from the reign of Alexander Severus (c. 205-35 A.D.). This requirement was probably due to the tendency of some of the associations to develop political aspects and to the consequent desire of the government to keep close watch on all of them. After the Christianization of the empire the popes claimed that their fiat was necessary to the creation of bodies corporate within the church. Thus certain ecclesiastical entities such as abbeys, monasteries and bishoprics were recognized by the Roman Catholic church as possessed of perpetual succession and a continuing body of property despite a changing membership.

In Anglo-Saxon civilization corporations were known in the early Norman period and possibly existed at an earlier date. The classic theory is that they originated in England in two institutions: the early English borough—an association of inhabitants joined together for mutual defense and civic works; and the mediaeval guilds—associations of traders or craftsmen organized to forward their interests, to provide for needy members and in part to con-

trol their respective trades. Until recently it was supposed that these institutions were created by crown franchise, but it now seems well established that both boroughs and guilds developed gradually and that they subsequently—from the time of Henry VI—obtained legal status by securing from the king patents recognizing their corporate character. This question is significant in the light of the American legal theory that a corporation is purely a creation of the state.

From the standpoint of economic form and functioning, however, the modern corporation can probably be traced more directly to certain peculiar developments in the business of overseas trade. Because of the great risk attendant upon navigation a practise developed under which a number of associates contributed to the fitting out of a single ship. The value of the ship was divided into shares according to the contributions of the original participants in the voyage, and the profits were distributed proportionally. Such early associations were formed purely by agreement of the associates, who fixed the terms under which each contributed to the capital of the enterprise and by which power was delegated to a person or persons chosen to manage the undertaking. Special treatment was accorded such sea trading ventures under Greek and Roman law. Similar overseas trading corporations existed in the mediaeval Italian ports. They appeared in Genoa as early as the twelfth century. The rapid extension of commerce to distant lands after the middle of the sixteenth century stimulated their formation and they soon spread to Holland, the Hanse cities and England. The famous British East India Company, formed in 1600, at first carried on operations in the established manner; but in 1602 the Dutch East India Company, generally considered the first stock corporation, was organized in Holland with a permanent capital, and in 1612 the English company began to issue stock on a more permanent basis, steadily lengthening the period of time for which the stock was issued.

The development of corporations in England entered on a new phase with the accession of the Stuart kings. James I and his advisers, perhaps taking an analogy from the ecclesiastical organizations of the Catholic church which were created bodies corporate by the church law, are thought to have brought into English law the so-called fiat doctrine, the theory that corporations are fictitious legal persons distinct from their officers or members and created by the fiat of

the state. History hardly warranted this contention, but the doctrine enabled the crown to extend control to all corporations, including boroughs, guilds and trading companies. At the same time it permitted the crown to grant monopolies and privileges to corporations organized by court favorites. The doctrine gained strength from the vigorous support of Lord Coke (1552-1634). It soon became the accepted legal doctrine that a "corporation is a franchise"—a "freedom" or grant of special privilege. The privilege not only permitted a number of associates to carry on an enterprise in a common name, to have a common seal and to appear in the courts in their corporate capacity; it usually included a monopoly of some sort, such as the right to run a ferry or a mill, or the exclusive privilege of trading in a particular area subject only to the rivalry of companies granted similar monopoly rights by other countries. To secure such a privilege direct negotiations with the crown were required, culminating in a royal grant of a charter or patent. The colonization of America and the appropriation of India were achieved primarily through the medium of such chartered companies.

On the continent the corporation was in fact frequently created by the sovereign and endowed by him with certain special privileges. The organization of such corporations was subject to royal concession, and especially in Germany the sovereign was an active force in their promotion and financing. Under the mercantilist political philosophy they were frequently looked upon as arms of the state, performing for the state certain functions of a public character. But the first principle never became accepted legal doctrine as in England and was in fact discarded under the *Code Napoléon*.

The success of the joint stock form, demonstrated by the Dutch and English East India companies, led to its increasing use. Near the close of the seventeenth century England entered on a period of extensive joint stock corporate organization. In 1711 a corporation, huge for its day, was chartered and granted a monopoly of the trade with the South Sea islands. In France John Law formed the *Compagnie de la Louisiane ou d'Occident* in 1717 to take over the grant for the Mississippi trade. While Law's Mississippi company was stimulating speculation in France, the rise in value of the South Sea securities led to a tremendous wave of company promotion and speculation in England. The puncturing of these two gigantic bubbles in

1720 brought the stock corporation into disrepute. Corporations continued to be formed under special royal grant or legislative act, but a new economic stimulus was needed to restore the corporation as an important force in economic life.

In both Europe and America the development of the modern corporation appears to have received its impetus from the industrial revolution. Economic expansion demanded larger economic units. Railway building especially was one of the dominant forces seeking large capital. The participation by the French, German and Austrian branches of the house of Rothschild in commercial as distinguished from governmental finance emphasized the financial aspect of the corporation. All over the continent banks in corporate form on the model of the *Crédit Mobilier*, organized in Paris in 1852, were established to help in organizing corporations. The organization of the steel enterprises in the Ruhr in Germany, the Schneider enterprises in France and the Skoda works in Austria were forerunners of the large scale industrial corporations of today. The corporation as the principal means of providing necessary large capital acquired increasing economic importance and more definite and liberal legal recognition.

France led the way in the liberalization of corporate law. In continental law a distinction had early appeared between two types of property owning entities. One was the "community," described as a purely passive property holding device, without hope of profit, whose distinctive characteristic was its maintenance of a body of property for common use but individual ends. Such was, for example, a quasi-corporate institution originating in Spain and on the whole limited to Spanish territory—the institution of land owned in common for a particular purpose, such as a sheep or cattle run, with ownership vested in a guild like the *mesta*, or wool growers' association. The other was the *société*—an active enterprise having, as Pothier observes, "... an ulterior and common end which was to acquire property, to realize profits, the association of the parties being only a means toward this end." At the time of the French Revolution the difference between these was recognized: in the community each associate had a right only to division or partition, whereas in a true association each associate had rights *pro socio*; that is, a right to insist that the concern be actively run for his benefit, that he be fairly dealt with and that he share in the profits.

A *société* (the generic name for all types of profit seeking associations from a partnership up to a true share capital corporation) was constituted by an active contract between the parties, and the parties were considered the shareholders. The entity resulted only from the segregation of a common enterprise and a common body of property coupled with a common administration. In this aspect the administration of the concern was more nearly a joint agency. Continental law, however, found the entity not in the legal form but in the enterprise; thus although the legal *société* may be reformed or entirely broken up, as by bankruptcy, the entity may persist where there is a defined enterprise which continues in existence. This realization that an economic unit maintains its existence in large measure irrespective of individuals or of legal machinery for its administration is well known now to economists in England and America, although its legal implications have never been adopted into Anglo-American law.

The modern French corporation takes its form essentially from the *Code de commerce* of 1807 (bk. i, title 3), which sets up three classes of commercial societies: the partnership (*société en nom collectif*), the limited partnership (*société en commandite*) and the share corporation (*société anonyme*). The *société anonyme* derived its name from the fact that the name of none of the associates could appear in the corporate title. Personal credit was not in theory to enter into its operations; it was strictly a body of property managed under common rules by officials subject to an administrative board; the shareholders had no personal liability; interests were distributed by means of shares of stock with voting rights. But unlike American stock securities these could be issued to bearer. This is the usual method of issuing stock in Europe today. Until 1867 the specific authorization of the government was required for the formation of a *société anonyme*. The thorough revision of French corporation law which took place in that year abolished the requirement for state authorization. A *société anonyme* is now formed by a contract witnessed by a notary and so registered as to be a public act; the articles of association are deposited with public registrars and made available for inspection by interested persons. French law was again revised in 1893, 1903, 1907 and 1917, and there have been many minor amendments. In 1917 the law authorized an arrangement by which the workers might participate in the corporate profits, permitting the creation of

"labor shares" which were not freely transmissible.

The conception that incorporation was a special concession specifically granted by the government to specific enterprises continued as a general feature of German law, except in the Hanse cities and a few other states, until the law of 1870 established the principle of the freedom of corporate organization. This freedom was subject only to compliance with certain normative provisions intended to protect stockholders and creditors. A period of widespread company speculation, culminating in the crash of 1873, brought demands for reform, and the thorough revision of 1884 set the fundamental character of modern German corporation law. It retained the principle of freedom of incorporation but safeguarded the organization of the company by provisions for publicity of its proceedings and liability on the part of the founders, and the operation of the company by provisions for liability, civil and criminal, on the part of the members of the managing body (*Vorstand*), the controlling body (*Aufsichtsrat*) and under some circumstances the stockholders. The law was revised in 1897 and modified at other times, especially temporarily during the World War.

In England the Bubble Act, passed in 1719 to stop the formation of joint stock companies not possessing a charter from the king or Parliament, was not repealed until 1825. Incorporation continued to be a matter of special grant by king or Parliament until 1844, when associations with more than twenty-five members were permitted to register as corporations. Limited liability was not accorded such corporations until 1855. The laws regulating joint stock companies with limited liability were consolidated in 1862 and again in 1908 and 1929.

In America the corporation has developed along distinctive lines and to a more advanced stage than elsewhere. Many of the American colonies had their inception in a trading grant to certain associates; these developed into governmental corporations and ultimately into political entities. In spite of the strong prejudice against business corporations some fifteen or eighteen of these can be traced prior to 1789. The revolution left the common law intact in the American states, thus perpetuating the principle that a corporation is a franchise but granted by the sovereignty of the state instead of by the crown. A number of stock corporations organized for business purposes appeared prior to 1800; the process of chartering them was sub-

stantially the same as that used in England except that the organizers dealt only with a legislature or a legislative committee. Most of these corporations desired special privileges from the state, such as the right to condemn land by eminent domain for canals and turnpikes or to issue banknotes or to occupy shore lands for wharves. Corporations later appeared which asked nothing save the right to have a corporate name and seal and the privilege of limited liability. Fear of monopolies, however, led the legislatures to restrict quite closely the powers granted to corporations in their charters.

With the disappearance of the demand for the grant of distinctive state privileges the function of the state in the creation of these corporations became obscure. The justification for the fiat theory came to rest primarily on the so-called grant of limited liability. So long as a corporation required a state privilege, there was ground for believing that the state maintained unlimited control or even that the corporation was in some sense an agency of the state itself. But limited liability is not necessarily a privilege granted by the state, since it can be obtained by the agreement of each creditor of the corporation that he will look only to the corporate assets and not to the individual property of the associates or stockholders. Many of the early charters did not involve limited liability, and in California at the present time the limitation is far from complete.

Beginning with the New York law of 1811 the states began to substitute general incorporation laws for the process of negotiating with the state legislature for a charter. The change was due to the inconvenience of the older system, the attendant legislative corruption and the danger of the grant of valuable public privileges to private corporations. The laws permitted organizers of corporations to write out their own charter in accordance with statutory requirements and to file this with an officer of the state, usually the secretary of state. Incorporation followed automatically upon filing of the application. Where special privileges were necessary, as where a railroad desired the privilege of condemning land, recourse to the legislature was still necessary. The laws laid down rigid requirements designed to protect creditors, some of which operated incidentally to protect the stockholders. Chief among the requirements were those that a certain amount of capital should be paid in before business was started, that stock should have a par value and should not be issued except against payment of such par value,

that capital could not be reduced or paid out as dividends to the prejudice of creditors, and that original holders of stock who had not paid full par value for their stock were liable to creditors to the extent to which they had underpaid for their stock. The securities which could be issued were rigidly delimited. By 1850 such general incorporation laws were common and by 1875 they provided the usual method of incorporation.

Meantime corporation managers found it necessary to ask constantly broadening powers for the operation of their enterprise. Consequently charters included grants of powers primarily adapted to the particular enterprise but empowering the corporation to do almost anything imaginable. With the advent of the first large American corporations about 1845, formed to operate the railroad systems, managers were faced by the constant need of raising additional capital in large quantities. They accordingly sought power to alter and vary the participation rights of shares of stock already floated or about to be issued. If, for example, a railroad financed by common stock needed additional capital and preferred stock was a convenient method of raising this, the corporate manager desired authority to issue preferred stock ahead of the existing and outstanding common, although this necessarily changed to some extent the rights of the common shareholders. As early as 1865 we find the germ of the modern conception of corporate power—the belief that the rights of the participants as well as the technical conduct of the business must be subject to managerial discretion. The grant of power to a corporation (which means, in reality, to its board of directors and senior officers) to vary participation, to change the rights of stockholders and to alter the apparent contract rights of such stockholders represented a very drastic grant of authority. On the theory that the state infused its life into all departments of the corporation the argument was at once made that any action taken by the corporate management was in some sense action by the state itself, although in fact the action was based primarily on the interests of the corporate management.

The common law had supplemented the doctrine of a state franchise with the doctrine that a corporate charter was a contract. This is still the law. The contract is in theory an agreement between the state and the corporation, the corporation and the stockholders and among the stockholders themselves. Logically much of this theory cannot be supported, but it is still ac-

cepted. The contract is said to include the charter and the general corporation law governing the charter; and stockholders by subscribing to or purchasing stock are held to have assented in all respects to the charter and to the law. So long as the law was itself rigid and required a rigid charter, this was perhaps not burdensome. But as corporate activities extended and as general incorporation laws became increasingly loose, permitting corporate organizers to write almost any clause they desired into their charters, the corporate charter became an extremely one-sided document, granting to corporate management the most extreme powers not only to operate the business but also to alter or take away preexisting rights of stockholders.

The history of the nineteenth century in American corporation law is in fact that of a slow abdication by the state of control over corporations. The process was hastened by the multiplicity of chartering agencies in the United States. Control of corporations was primarily vested in the individual states. For most purposes the charter granted by one state was equally effective for carrying on corporate business in others. Individuals seeking a corporate charter went to the state granting the broadest powers. Certain states became known as "charter mongers," and the competition among them for the income derived from this source resulted in the granting of ever broader powers to the corporations and especially to corporate management. The process may be said to have been completed upon the enactment by certain states (notably Delaware, Maryland and Nevada) of general corporation laws permitting extreme latitude to corporate management, an opportunity promptly seized by corporations which in increasing size and number have used such states for their incorporation. The increase of management power has roughly paralleled the increasing size of corporate enterprise, thereby setting the stage for the corporate system of today.

In practise the business corporation in the United States appears in two forms, the private and the quasi-public corporation. These are so essentially different in character that they must be regarded as distinct institutions. No sharp dividing line separates the two, but the difference becomes evident when more or less extreme types of corporations are considered. An individual can incorporate his private business, thereby setting up a legal alter ego as the nominal vehicle for its conduct. His business will

remain as before except for such legal changes as the limitation of liability, the new tax status and the necessity that it be managed at least nominally through a board of directors. In essence it remains a private business. In contrast, the corporation may be employed to combine the capital of many investors secured through the public securities markets into a single enterprise, bringing great aggregates of wealth under a single control. In this form the corporation assumes a quasi-public character and gives rise to problems of economic and social organization of far reaching importance.

The most obvious and pressing of these problems is the inevitable separation of ownership and control which the quasi-public corporation involves. The functions of the entrepreneur become divided. The single owner of a private business, exercising all the functions of the entrepreneur—supplying the capital, taking the risk, managing the property, receiving the profits and exercising ultimate control over all—is replaced by two groups each exercising certain of these functions. One group, the security holders, supplies the capital, takes the risk and presumably receives the profits without exercising any appreciable degree of management or control over the enterprise or over the capital which they have contributed. Control rests rather with a group which can dictate the choice of all or a majority of the board of directors and which therefore exercises ultimate authority over the enterprise, authority almost princely in its extent, almost despotic in its character but frequently due only in a negligible degree to ownership in the enterprise.

The first stage in this separation of ownership and control is that in which the ownership of a majority of the voting stock of a corporation lies in the hands of an individual or small group while the remaining stock is scattered. In such a case control is in large measure combined with ownership and the controlling group is able to maintain its position almost indefinitely. At the same time the minority stockholders are virtually without a voice in the management of the company except where they have the legal right to elect a minority of the board of directors, a rare provision. Their interests may be protected to a very considerable degree, however, by the large proportion of ownership held by those in control. Where the major interests of those in control, however, are in some other business, similar or related, the large proportion of ownership in their hands may be of little protec-

tion to the minority owners. This is especially true where the corporation is the subsidiary of another corporation engaged in the same type of activity.

There are various devices through which control may be further separated from ownership. One is the voting trust, or the pooling of a majority of the stock in the hands of trustees having power to vote it. The most recently adopted device has been the disfranchising of all save a very small class of stock, a device used notably by the banking house of Dillon, Read and Company in its reorganization of Dodge Brothers Motor Company. The use of this device of non-voting stock has, however, received a setback owing to the hostility of the New York Stock Exchange. A familiar and popular device is that of the pyramided holding company, best typified by the system through which the Van Sweringen brothers maintain control of their transcontinental railway system. Reduced to its simplest terms this device involves the control of one corporation by a second smaller corporation through majority stock ownership, the control of the second by a third still smaller and so on. By sufficiently pyramiding the chain of holding companies a very small investment may achieve control of a tremendous aggregation of corporate capital. This is the typical process by which the large public utility systems have been built up. By these devices legal control can be maintained almost as effectually as by majority ownership, yet with only a small proportion of the investment which the latter would involve. The minority of disfranchised stockholders can rely on the ownership interest of control to a much smaller extent; and only in the case of the voting trust, where trustees assume acknowledged fiduciary responsibility, is the stockholder given partially compensating protection.

Control although of a somewhat more precarious nature can be maintained through the ownership of a large minority interest. Where the ownership of the remaining stock is widely scattered, 15 or 20 percent of the voting stock may be sufficient to perpetuate a control already established. If contested, however, its continuance may depend upon the active good will of many other stockholders. The larger the corporation and the more widespread the ownership the more easily is such control retained.

The most significant form of control is management control, which rests primarily on the power to use the proxy machinery. Where ownership is so widespread that no one indi-

vidual or small group owns more than a very minor fraction of the voting stock, the management—the board of directors and senior officers—may retain their control without appreciable ownership. The board of directors although in theory elected by the stockholders is in practice elected by “proxies,” or agents named by the stockholders to act for them at the annual election. Prior to that election the management sends a proxy slip to each stockholder proposing a certain individual as his proxy. Stockholders rarely either attend meetings or name proxies other than those suggested by the management; the latter therefore receive the power to vote most of the stock represented at the election. Armed with these powers they attend the annual meeting and elect their slate of directors. Control can be wrested from the management only through the purchase of a majority of the voting stock or through a proxy fight, in which outside interests establish a committee and seek proxies from the stockholders in competition with the committee sponsored by the existing management. Where the volume of stock outstanding is very large the capital investment necessary to purchase a majority would almost prohibit such action, while a proxy fight against an existing management is both very expensive and likely to be unsuccessful except when the corporation has been seriously mismanaged. The difficulty is increased by the fact that the expenses incurred by the existing control in maintaining its position are paid out of the corporation treasury. The larger the corporation and the more widely distributed the stock, the more easily can an existing management retain its position through control of the proxy machinery. Such a management becomes virtually a self-perpetuating body. Such control without appreciable ownership has already been attained in many large American corporations, such as the American Telephone and Telegraph Company, the General Electric Company, the Pennsylvania Railroad and the United States Steel Corporation, and it appears to be the form toward which the modern corporation is tending. In such a corporation the separation of ownership and control is well nigh complete. The stockholders no longer hold the position of partners in an enterprise; they have joined the bondholders as suppliers of capital. They are merely lenders of capital with a return which is not fixed but contingent upon the will of those in control. Their right to vote has become a right to revolution rather than a method of control.

Interests in the property of these great quasi-public corporations are represented by a variety of securities, which are for the most part held by public investors and bought and sold in the public markets. Primarily these securities represent possible participations in the future earnings and assets of the various corporations. They range in an almost continuous hierarchy from gilt edged bonds having a fixed return and bearing almost no risk, through stocks having greater opportunity of return with greater risk, to the newest instrument of finance, stock purchase warrants, having possibilities of the highest return but involving a most extreme degree of risk. The law divides them arbitrarily into three classes: obligations which are in theory debts of the corporation; stocks which are in theory rights to participate in the earnings and in case of dissolution in the assets of the corporation; and stock purchase warrants which are options with a legal status yet to be defined. It has likewise been customary in the past for economists to distinguish between bonds which were loans and stocks which were a form of partnership in an enterprise (warrants are too new to have been considered) and to assume that they required quite different treatment.

While such a distinction could properly be drawn in the case of a private corporation it has ceased to have meaning with regard to the quasi-public corporation. From the economic point of view this sharp distinction between bonds and stock has disappeared. Each has tended to become more like the other. Formerly the bondholder looked for his safety to the physical property of the corporation. He was safe whether the company was operated well or badly, since if his principal and interest requirements were not met he could seize the company's tangible property, sell it and thus protect himself against loss. Some bonds are still of this nature, but as corporations have increased in size and complexity their wealth has tended to take less the form of tangible goods and more the form of an organization built up in the past and available for use in the future. Even the tangible goods have come to have value primarily because of their organized relationship within the company. The value of the company's property is therefore in the main dependent on continued operation. If the company is dismembered the value of the organization disappears, and the tangible property has little more than scrap value. The expectation of interest and ultimate return of principal must rest upon the

profitable operation of the business. From the economic point of view the bondholder may thus be regarded as a participant in the enterprise with a fixed return and priority over the stockholder in both interest and principal.

The hierarchy of securities introduces an element into the modern corporation with which neither the lawyer, the economist nor the business man has effectively coped. In theory the participants in a corporation are all working toward a common end. In practise the varied claims of different security holders are frequently and perhaps necessarily hostile to each other. Thus bondholders will wish limitation of operation and conservative management in the direction of safety of their principal and interest. But a class B stockholder, who has a security costing him little and with little or no equity behind it, will wish the corporation to take extremely long chances on the theory that he has little to lose and everything to gain. Management is required to harmonize all of these interests. It is only too easy, however, to sacrifice one group within the corporation for the benefit of another and only too human for the management to be influenced by its private interest in particular classes of securities.

The new power of management to apportion earnings and assets between the various participants in the corporation is obviously distinct from the old common law power to manage the enterprise. It has no close connection with the power to run a plant, to determine the selling prices of goods, settle effective operating policies or the like. All of these policies may remain unaltered, but under cover of a continuous uniform and profitable operation various legal devices may permit the management to enhance the value of one class of securities at the expense of another.

Thus the corporation may be financed with non-cumulative preferred stock and common stock. Under the rule in the federal courts a non-cumulative dividend although earned is lost forever if it is not declared. But the discretion of directors to declare or not to declare dividend on such stock is almost absolute. It is thus possible for the directors of a corporation which is earning profits to withhold dividends on the preferred stock year after year, building up an equity in the common stock out of the dividends so withheld. Again under the laws of certain states, notably Delaware, a fairly large proportion of the consideration paid for stock may be assigned as "paid in surplus"—immediately

available as dividends. Where a large proportion of the consideration paid for the issue of preferred stock only has been assigned as paid in surplus and dividends are declared for both preferred and common stock, the effect is to turn over to the common stockholder a part of the capital contributed by the preferred stockholders.

To meet these possibilities of exploitation the legal doctrine is slowly being developed that all powers granted to the management to shift property interests in earnings or in assets must be considered as having been granted as powers in trust to be used only for the general benefit of all concerned. It is thought by some students of corporation law that the law will ultimately cope with such powers by declining to sanction their use except where it is shown to be reasonably necessary for the benefit of the enterprise as a whole and where the interests of no class of security holders are unduly sacrificed. But this doctrine is still in its infancy, and the difficulty of legal enforcement is great.

The stockholder's position is further weakened by a curious development in American law. The individuals who constitute the management owe to the corporation certain fairly well defined duties. They must act with reasonable business prudence. They must be reasonably diligent. They must not acquire an interest adverse to that of the corporation in any transaction on which they may be called to pass in its behalf. Thus directors cannot be merely passive and shelter themselves from the claim of mismanagement by pleading inattention to the company's affairs. Nor can directors purchase property and resell it to the corporation at a profit. While this standard of fidelity is somewhat modified in the modern law, there is no marked tendency to eliminate the original demands made upon the persons actively conducting the corporation's affairs. But the law has introduced a metaphysical distinction. These liabilities, it is said, have to do only with the corporation and not with the individual shareholders of the corporation. Accordingly, the shifting of interests within the corporation from preferred to common stockholders or the like does not fall within the normal legal doctrine. The corporation as such is not hurt if one block of assets is transferred from one class of stock to another; the total corporate assets remain the same. There is a damage to one group of shareholders; there is none to the corporation. Hence there is no liability on the part of the directors.

The usual security holder in America is thus slowly being reduced by these devices and interpretations to a point where he becomes a petitioner for the wages of capital. He is safeguarded rather by business ethics and policy than by any easily enforceable right. In Europe the separation of ownership from control is growing, although it has not yet reached the stage which it has in the United States. The European corporation tends to be a more rigid unit and many of the devices worked out in the United States to secure varying participation in earnings and control are unknown in continental law. But the increasing use of many of these devices, together with the limitations placed upon individual corporations by the intercorporate combinations which are so common on the continent, places the shareholder in a position which approaches that of the American shareholder, who is, furthermore, probably far more likely to attempt to vindicate his rights in courts than is the European. In Germany especially the problem of the divergence between the corporation and its stockholders has become an increasingly important problem. Walter Rathenau in *Von kommenden Dingen* (Berlin 1918; tr. by Eden and Cedar Paul, London 1921, p. 119-22) suggested that corporate enterprises had reached a stage where they were almost nameless, soulless and without any individual objective; he suggested the logical possibility that a corporation might even own all of its shares, continuing as a self-perpetuating organization of men working for an idea as abstract as the concept of the nation.

The true significance of the corporation can best be seen in the light of the development of business in the last three centuries from the extreme individualism of private enterprise to the collective activity of the modern giant corporation. The corporate system has done to capital what the factory system did to labor. As the factory system separated control from labor, so the corporate system has separated control from ownership. The one brought the labor of a multitude of workers under a single control, the other is bringing the wealth of countless owners under the same unified control. The limits to the size of the business unit have thus been extended far beyond the bounds of the wealth of the individual or partnership, as they were before extended beyond the bounds of the labor of a single worker and his apprentices. The economic areas within which production can be conducted on a rational coordinated basis be-

come limited only by the ability of a few individuals to administer successfully the huge organization of workers and of wealth which can be brought under their control.

The centering of economic activity in the hands of a few giant corporations has already progressed far and is continuing at a rapid rate. Corporations today carry on most of industrial and an increasingly large part of commercial activity. While a great many of these are private in character, the bulk of corporate wealth is in quasi-public corporations. In 1927 nearly half of the wealth and income of corporations (not including banks and other financial corporations) was owned or controlled by two hundred companies, for the most part quasi-public in character. The relative growth of the large companies in the last twenty years has been such that if the same rate were maintained all corporate wealth would be in the hands of two hundred companies within fifty years—a concentration of economic power unknown in the world's history, unless it be compared to the present control of Soviet Russia.

The development of large scale business, predicated in the modern world primarily upon the quasi-public corporation, has raised problems of the new relationship of business to the workers and to the consumer. With the increase in the scale of business more and more individuals who might have been independent entrepreneurs have become major or minor executives without the independence and the full spur of business profits inherent in private enterprise. At the same time the individual laborer works for a distant management which tends to assume in his eyes the form of an impersonal force rather than the direct individuality of the owner of a private business. The very strength of the quasi-public corporation as an employer weakens the bargaining position of the workers even when organized, makes organization more essential to their welfare and is often used to make impossible or to destroy such independent organizations or to replace them with dependent or "company" unions. These same factors, however, may make possible a more rational planning of production with greater stability of employment. A few corporations have advanced far in this direction: some plan their work on a long time schedule in order to have full time work for the bulk of their employees; others insure against unemployment; still others guarantee practically full time employment to all but their newest workers. On the

other hand, some corporations have aggravated the instability of employment. It has yet to be proved that the corporate system as a whole has provided the worker with any greater economic stability.

The position of the consumer like that of the worker has been weakened by the size of these organizations. He has to deal with a great impersonal institution which considers its consumers in statistical tables and averages, as types and not as individuals; which is weighed down with rules and regulations; which may have a very considerable control over prices, either monopolistic or duopolistic in nature; and which supplies standard goods or services throughout national or international markets. At the same time the size of the corporations may through the possibilities of research and mass production supply a type of product or service of a quality and cheapness quite beyond the power of smaller companies.

Control of the relations of big business to the consumer and the worker necessarily involves control of the quasi-public corporation, the form which modern large scale business usually takes. When the state has attempted to regulate the business of the corporation it has done so primarily from the standpoint of state policy toward monopoly, unfair competition and public utilities. This regulation has been extended into other fields, such as those of finance and labor relations. But the bulk of corporate activity today is unregulated. The entire problem of the relations of government to large scale business as represented by the giant corporations remains controversial. In the United States especially there is vigorous opposition to any attempt by the state to regulate the activities of corporate business as such and considerable cynicism as to the ability of the state to intervene effectively.

The corporation has become more than a method of doing business; it has assumed the aspect of an institution of social organization comparable to the state itself. During the Middle Ages the church, exercising spiritual power, dominated Europe and gave to it unity at a time when both political and economic power were diffused. With the rise of the modern state political power became concentrated into a few large units and challenged the spiritual interest as the strongest bond of human society. Out of the long struggle between church and state which followed, the state emerged victorious and nationalist politics superseded religion as the

major unifying force of the western world. Economic power still remained diffused.

The rise of the modern corporation has brought a concentration of economic power which can cope on equal terms with the modern state—economic power versus political power, each strong in its own field. The state seeks in some aspects to regulate the corporation, while the corporation, steadily becoming more powerful, seeks independence and not infrequently endeavors to avail itself through indirect influence of governmental power. Not impossibly the economic organism, now typified by the corporation, may win equality with the state and perhaps even supersede it as the dominant institution of social organization. The law of corporations, accordingly, might well be considered as a potential constitutional law for the new economic state; while business practise assumes many of the aspects of administrative government.

CORPORATION FINANCE deals with the financial problems of corporate enterprises. These problems include the financial aspects of the promotion of new enterprises and their administration during early development; the accounting problems connected with the distinction between capital and income; the administrative questions created by growth and expansion; and finally the financial adjustments required for the bolstering up or rehabilitation of a corporation which has come into financial difficulties. Three phenomena of our time have constantly augmented the social importance of corporation finance: the extent to which business today is corporately organized, the widening distribution of corporation ownership and the increasing tendency to separation of ownership and management.

The extent of corporate organization can be indicated by a few summary figures. In the United States all railroads and the great majority of public utilities are organized as corporations, while about nine tenths of the total manufactures are produced by corporations. The numerous mergers of the post-war period have reduced the total number of corporations, increased their average size and correspondingly complicated their financial structure. No single individual could furnish capital for the huge enterprises of today. For instance, the capitaliza-

tion of the Pennsylvania Railroad system is over a billion dollars. Such funds are obtained either through the use of credit—long time obligations called bonds or short term loans for current needs—or through the sale of stocks which represent ownership rights in the business. The bond issues of the railroads are held by life insurance companies and savings banks, which in turn are the property of thousands of thrifty individuals whose savings these institutional purchasers have invested. The United States Steel Corporation has more than one hundred and fifty thousand individual stockholders. Such business activity rightly entails public concern. The interaction among increasing size of corporations, increasing groups of stockholders and bondholders and their increasing public importance is one of the most significant elements in contemporary economic life.

These changes have been concurrent with a growing divergence between owners and operators. In small undertakings such a separation is difficult and inexpedient. The farmer is both owner and operator of his farm; even the small manufacturer may own his workshop, hire his employees, supervise manufacturing operations, act as his own sales manager and control all financial policies. But when ownership is distributed among a great number of stockholders, responsibility for administration necessarily passes into the hands of trained specialists paid for their services. The all important economic problem of the past century has been to secure to private managers the necessary capital to carry on vast and expensive undertakings and at the same time to preserve the initiative and coherence, the force of individual ambition with its attendant responsibility, that ordinarily go with the private conduct of an enterprise. The corporation has furnished one solution of the problem. The stockholders and bondholders furnish capital in unlimited amounts; the officers and directors of the corporation retain the responsibility of private effort.

The capitalization of a corporation includes the capital stock which it has issued and its permanent or funded debt; in other words, the total securities or representative values issued by the corporation against its actual property. State laws attempt to insure that such capitalization shall not exceed the "value" of this property, but as the appraisal is made by the promoters of the enterprise, this state supervision and control is of limited significance.

The chief instruments of capitalization are

bonds and stocks. Bonds, paying a fixed rate of interest and usually issued in denominations of five hundred dollars and upward, are the guaranty of loans made over a long period. Like mortgages they are usually secured by specific property. Yet in the last analysis their value is dependent upon the earning capacity of the corporation which issues them, since the liquidation value of an idle plant is negligible. The payment of their principal and of their interest, however, is legally a first obligation on the business.

Shares of stock in contrast to bonds represent ownership in the business and as such carry its responsibilities and risks. After the payment of debts, fixed charges and such preferred stock dividends as have been contracted for, the common stockholders own the remainder of the business in proportion to the number of shares held. In general common stock alone is vested with voting power, by which its shareholders control the policies of the corporation through the directors they choose. Preferred stock guarantees its holders a fixed dividend rate, payable before the common stockholders receive anything, and priority of claim in case of liquidation; but the preferred stockholder usually has no voting rights and no claim to any earnings beyond the guaranteed dividend.

It was formerly the universal practise to assign a nominal value to shares of stock; this was known as the par value. The only permanent and important fact about capital stock is that it stands for a definite share of the corporate property, whatever the fortunes of the business. Hence this nominal value has little actual significance and is frequently misleading. In recognition of this fact and in view of the added ease of manipulation it is becoming more and more the custom to issue stock of no par value.

Underlying all developments of corporation policy is the organization and establishment of the corporation as a going enterprise. This is promotion. A successful promotion usually involves the cooperation of a promoter with entrepreneurial ability and of a banker who makes available large supplies of capital. Five stages may usually be distinguished in the promotion of a large corporate enterprise: the conception of the enterprise by the promoter; the working up of its details, also by the promoter; the formulation of the financial plan, usually the joint work of the promoter and the banker; the formation of an underwriting syndicate by the banker; and, finally, the sale of the securities of the corpora-

tion to the public, from whom ultimately the capital is obtained.

The promoter, in spite of a common and regrettable misunderstanding of his function, really performs a valuable service to the community in that he discovers business possibilities, sifts them out and does the necessary but often unprofitable work of organizing the means for realizing in practise what has been merely an idea or project. Since his payment is generally common stock of the company, he assumes large risks and bases his hopes for remuneration on the success of the promotion. Those who see the great profits which are occasionally the reward of courage and imagination overlook the cases where the promoter expended much time and effort only to see the project fail through no fault of his own.

After a preliminary investigation of a proposed enterprise the promoter approaches an investment banker, one of whose functions is the forecasting of the future social and economic needs of society. The modern investment banker subjects the promoter's estimates to the analyses of a large staff of specially chosen experts, who report on all questions of cost and construction. While he calls to his aid for examination of technical details the engineer, the accountant and the lawyer, the final decision rests on his own judgment.

Perhaps the most important function of the investment banker is his mediation between the promoter and the great body of small investors whose aggregate savings are necessary for the further development of the enterprise. In selling the securities of a corporation, whether a newly organized or an established enterprise, the banker acts as a retailer of forms of capital investment. Once he has agreed to market an issue of stocks or bonds, it is the usual practise for him to form an underwriting syndicate in order that the financial responsibility may be divided. This syndicate is a temporary association of bankers, each of whom agrees to take over and sell a definite amount of the securities in the issue. The sale of securities is accomplished by the same merchandising methods as are used in the sale of any other commodity. Quite generally, however, the investment banker sells his securities more on his own standing and the success of previous enterprises with which he has been connected than upon the actual value or earning power of the assets behind the securities. For this reason he tends to be very reluctant to promote untried enterprises.

Because his reputation is so closely involved, the banker often formulates the financial plan according to which bonds and stocks are issued; and he may supervise the organization and audit the accounts of the company, if large amounts of money are to be spent immediately. Often the investment banker becomes identified with the undertaking for a considerable period, and in any case he quite generally retains some form of supervision through acting on the board of directors or as chairman of the finance committee. There is an implied mutual obligation, on the part of the banker to supply the further needs of the corporation for capital and on the part of the corporation not to turn to other bankers without his consent. Another customary service of the banker is the maintenance of a fair market for the securities he has sold. Failure to do this would penalize clients obliged to dispose of little known securities and by depressing the price of these securities would endanger the credit standing of the corporation which issued them. Hence the investment banker usually agrees to buy back at a figure slightly below the prevailing selling price securities which investors wish to sell.

In European countries, where a far greater degree of supervision over the setting up of a corporation is exercised by the government than is the case in the United States, the investment banker plays a less significant role in the original determination of the financial structure of a corporation. Nevertheless, his advice and assistance are essential to most corporate organizations and especially to the continuing adjustment of the corporation to changing business and economic situations.

Formulating the financial plan for a corporation, usually the joint task of the promoter and banker, involves decisions as to the proportion of each type of security, as to the interest rates of the bonds and the dividend rates for preferred stock. Such decisions are determined by the value and cost of the tangible assets to be acquired by the company, the certainty and regularity of expected future earnings, the traditions and width of market in which the securities are to be sold and the attitude of promoters concerning the concentration of control of the enterprise. It is generally agreed that except in fixing the amount of money that must be raised at the time of promotion the cost of property should have no influence on the financial plan. The determining factor is earning power: the amount of earnings and their presumptive

regularity. In the case of an established business these can be estimated from past experience of the corporation over a period of years, although the dominant importance of skill of management has always to be taken into account.

Sound policy requires that bonds should be issued only when the future earnings of the corporation are liberal and reasonably constant; that preferred stock may be issued when the earnings are irregular but, when averaged over a period of years, give a fair margin over the preferred stock dividend requirements; that, when earnings are uncertain and unpredictable, common stock only should be issued. In any case it is desirable that capital be obtained from the sale of bonds only if the interest charges will amount to less than half the anticipated income. If no bond issue is required, preferred stock dividends may run to two thirds or even three quarters of the minimum. Even if it were possible to market bonds of untried enterprises, it would be unwise to burden them with fixed charges, since the uncertainty of their earnings is still greater than for established companies. Failure to pay interest on bonds leads to financial disaster, a default of preferred stock dividends severely impairs credit, but non-payment of dividends on common stock is a risk undertaken by the owners of the business and is followed by no disruption of the corporation.

The relative marketability of bonds, preferred stocks or common stocks also influences the outlines of the financial plan. Security with low income yield, greater risk with possibilities of higher income and appreciation of capital investment, or adaptation to tax requirements appeals more or less at various times and to various types of investors. For instance, in the period from 1926 to 1929 common stocks were readily absorbed, while there was little market for bonds. Since voting power is usually vested in the common stock alone, most promoters and bankers endeavor to keep this type of security in their own hands, so that they may control the business and profit from any exceptional earnings. Capital is obtained from the public, when conditions warrant, by the sale of bonds and preferred stock which pay interest or dividends as low as is consistent with marketability. When money is needed for the expansion of an established business, capital can usually be obtained at lower cost by a bond issue than by the sale of stock, and control is retained by the present owners of the business. On the other hand, stock carries no enforceable obligation to

pay regular dividends, and the ability to market it is helpful to the credit of the corporation.

Although many corporations have successfully marketed securities direct to their stockholders, there are decided advantages in the more usual method of selling them through an investment banker. Close association with a banker often proves useful in times of stress, when capital is difficult to obtain. Moreover, not only is the banker able to distribute securities at lowest cost, but the corporation obtains capital from him in advance of their final distribution. Through the banker's established connections the securities reach a wider market, by no means a negligible element in insuring price stability and discouraging speculation in the company's securities.

In recent years many corporations have supplemented the sale of stock through the ordinary market channels by its sale to customers or employees. Aside from the fact that this taps a new source of capital it gives the customers or employees a common interest with the corporation and tends to make them economically conservative. Public utilities in particular have marketed large issues of preferred stock among their customers at low cost. At the beginning of 1930 it was estimated that a billion dollars' worth of employee stock was held by 800,000 employees in the United States. The implied obligation of the corporation to maintain dividends to these special groups of stockholders is, however, somewhat greater than in the case of a general distribution.

A common method of raising new capital is the "privileged subscription," the offer by a corporation to sell a new security, usually a stock, to its stockholders for less than the current market value. To be a successful means of raising new capital the market price of the outstanding stock must be well above the price at which the new stock is offered and the outstanding stock must be widely held, or the failure of a few stockholders to use their subscription rights will throw these rights on the market and depress the price of both outstanding and new stock. Moreover, stockholders must ordinarily be convinced by the directors that the new stock is issued to secure capital for a justifiable purpose and that it does not dilute their equity.

The capital invested in a corporation falls into two main divisions: fixed capital, invested in land, buildings, equipment and permanent improvements to the plant, which are not likely to be resold; and working capital, which is used in

the operation of the business and turned over with relative rapidity. Working capital is the flow of raw materials, goods in process of manufacture, finished goods, ledger accounts, notes representing sales of these goods and the cash recovered for such sales waiting to be spent again for raw materials.

Four factors influence the amount of working capital which a business requires: the technique of the business, the period of manufacture, the customary credits allowed customers and the fluctuations in the availability of raw materials and of demand for the products. Railroads and public utilities have enormous plant investment but require relatively little working capital, because practically no raw materials are required, no finished materials are stored and the services they sell are paid for soon after they are delivered. Such a manufacturing business as a tannery, on the other hand, may have only a few thousand dollars invested in vats in a dilapidated wooden building, but through these vats may pass many thousand dollars' worth of expensive skins. Distributing businesses require large amounts of working capital in proportion to their fixed capital. The amount of working capital required increases with the length of the period between the purchase of raw materials and the sale of finished goods. This factor is more or less in the control of the management, since shorter processes may often be introduced or semi-finished parts purchased. Also partially under management control is the credit policy; liberality in granting credit necessitates ample working capital. For example, some mills have as much working capital tied up in accounts as in inventories, while on the other hand a well known chain store system operating on a cash basis has over \$6,000,000 in inventories and less than \$100,000 in accounts receivable. Whether to tighten credit terms and perhaps reduce sales is a matter of policy which must be decided by the management. Large inventories also create a demand for working capital, whether these are due to advance purchases to insure a supply of raw materials or to the seasonal nature of the business, which forces holding a stock of finished goods. These factors have resulted in increasing emphasis on management devices to secure rapid turnover.

Working capital may be obtained in three ways or by combinations of the three. Some part of it may be borrowed from creditors with or without their consent. Whether a corporation obtains the use of its money for a longer period

by delaying payments to companies from which it makes purchases or pays less by availing itself of discounts allowed for prompt settlement, it is in effect securing loans from its creditors.

Or working capital may be contributed by the stockholders, in which case the entire working capital of the corporation is represented by net quick assets. In a youthful, vigorous and profitable industry it is usual to obtain the successive increments of working capital by continuous reinvestment of earnings. Later, when the business is seasoned, it becomes comparatively easy to obtain new capital by the sale of stock. In either case these additions to working capital come from the stockholders as direct investment or through withholding of dividends as indirect investment.

Institutional banks are the third source of working capital. The corporation may obtain funds directly through establishing lines of credit or indirectly by the sale of commercial paper through note brokers. The banking tradition that total working capital should be twice the current debts to banks and merchandise creditors is today being superseded by a tendency to extend credit on the basis of the corporation's earning power, as it is recognized that in a general depression no ratio between working capital and debts can insure immediate payment.

The cost to a corporation of borrowing through banks or through a note broker is approximately the same. The ability to sell notes in the open market is helpful to credit, but the corporation loses the advantage of close banking connections, which may be indispensable during a business crisis. Regular frequent borrowings from banks give stability to a corporation's credit and the money is obtained at lower rates than through the sale of stocks. A reserve for working capital obtained from stock issues must be invested in high grade easily salable bonds or loaned on call so as to be immediately available, and the interest obtained will be lower than the dividends paid on the stock. Such a reserve, however, makes the corporation independent of all fluctuations in the demand and supply of money.

The favorable difference between the property of a corporation and its debts is known as the surplus. Changes in this surplus from year to year arise from profits or losses. The amount of this surplus at any time can be determined only after the difference between gross receipts and direct costs has been calculated, various indirect costs deducted and an adjustment made be-

tween payments and receipts of interest, rentals, royalties and the like not directly derived from the business. Direct costs such as labor, materials and rent are easily ascertained, but indirect costs are dependent on estimates. In the conduct of a business therefore accountant and managers set aside from gross receipts sums of varying amounts for reserves to meet these indirect costs.

One of the most important of these indirect costs is the depreciation reserve to compensate for the wearing out of physical property used in the business. The amount appropriated yearly to pay for replacements must be, so far as it is possible to determine, proportionate to actual deterioration. Standard rates of depreciation have been worked out for different types of property and are generally used by corporation accountants. Irregularity in such appropriations is often an indication of manipulation of accounts to conceal unusual earnings or to bolster up the statement of an unsuccessful year.

More difficult to compute than depreciation is obsolescence, since no one can predict when new inventions may destroy the value of costly machinery or patent processes. Hence another and generous reserve must be created to replace equipment which becomes out of date while still serviceable. The amount of this annual allowance will naturally be largest in forms of business dominated by the style element or in which new processes are being developed with unusual rapidity. Expenditures of the iron and steel trade in the United States in one year for construction to accommodate new technical processes were estimated to total \$70,000,000.

Most businesses also require special reserves to meet such risks as are not covered by insurance and paid for among direct costs for premiums. One of these risks is possible legislation which may impose unforeseen taxes or require expenditures which bring no corresponding financial return. In the latter class, for instance, are labor laws limiting hours of work or requiring specified sanitary or safety conditions within a plant.

In determining the corporate surplus adjustments must also be made by deducting interest or discounts paid for bank or mercantile borrowings, bond and note interest and similar charges on capital and by adding such interest earned by corporation funds loaned or discounts taken. Rentals or royalties paid and received on property or patents are also balanced.

Theoretically the surplus remaining after the setting aside of reserves and the payment of interest and other capital charges may be distributed in dividends. Actually, since the computations of the accountant are based on estimates of engineers, credit men and others, great caution must be exercised to maintain the economic value of the business. Hence experienced business men are more than likely, even after all anticipated exigencies have been provided for, to lay aside yearly a further sum for unexpected emergencies. Within recent years much more attention has been turned to detailed planning and budgetary control than formerly. Cost accounting systems based on records which establish the cost of manufacturing and selling a unit of product make possible the forecasting of future business transactions and the estimate of expenditures by departments as well as for the corporation as a whole.

It is an established principle of law and finance that dividends may not be paid out of capital. But after all interest charges have been met and all special reserves laid aside, business expediency dictates how much of the so-called stockholders' surplus which remains shall be disbursed. The foremost question is the proper balance between the dividend payments and the amount of yearly earnings to be reinvested in the business. Two considerations affecting this decision have already been touched upon: the varying needs for working capital and the element of uncertainty in the best estimates of accountants. A third is that dividends should be constant and regular. Regularity of dividend payments attracts stockholders who buy for investment rather than speculation and strengthens the credit position of the corporation when it has occasion to negotiate loans or to market bonds. Earnings are subject to fluctuation, differing in extent according to the type of business. In general, earnings of corporations producing inexpensive necessities, sold to and immediately consumed by the ultimate consumer, are most regular and most subject to reliable prediction; earnings of corporations producing costly commodities sold to other producers and not absolutely necessary for their business operations are least regular and least subject to regular prediction. To secure regularity of dividend payment the directors must set aside reserves in good years to be drawn upon in poor years and must fix a dividend rate so far below average net earnings that the undistributed profits shall be added to more frequently

than drawn upon. In the end the regular dividend is a matter of arithmetical averages of earnings through a series of years. If a conservative policy results in the accumulation of more undistributed profits than the business requires, there may be an additional distribution to stockholders. Unless this is clearly designated an extra dividend, expectation of its continuance may be awakened, the non-fulfilment of which will eventually affect unfavorably the market price of the corporation's securities.

Although dividends are usually paid in cash they may be distributed in the form of securities. The stock dividend is the most common and the most important of such payments. Since legally no stock should be issued unless it represents property equivalent to its full par value, stock dividends are justifiable only if a considerable amount of actual earnings has been used to acquire new buildings or equipment or to increase net quick assets so as to maintain or strengthen the credit position of the corporation. If a corporation is seeking to obtain capital from outside sources, it is a misrepresentation to proceed as if it had capital to divide in the form of a stock dividend. It is also wise for directors to avoid creating the impression that a stock dividend is declared to aid manipulation of the market price of the stock by those in control of the company.

An outstanding characteristic of the past decade has been the growing tendency toward corporate expansion through concentration of financial control. Public sentiment is less opposed to consolidations than formerly and legislation, as in the case of the railroads in the United States, sometimes directly favors them. One of the most effective devices for centralized financial control of otherwise separate companies is the holding company (*q.v.*). Such a company is organized under the laws of a state which permits its corporations to hold the securities of other corporations in its treasury. After acquiring at least a majority of the stock of the corporations which it seeks to control, the holding company either issues its own stocks against these treasury securities or markets new security issues for the subsidiaries. Through the central financial organization the subsidiaries profit from the economies of large purchasing and obtain technical, legal and management service which would have been prohibitive in cost to them as separate units. The holding company renders both temporary and permanent financial aid to its subsidiaries: weak companies are tided over critical periods, often by

using the credit of the stronger subsidiaries, and the credit of the whole organization is made available to those companies which are so small or so deficient in earning power that they have no independent credit. The established name and the banking connections of the holding company enable it to sell securities at lower cost and in a wider market than would be possible for the individual subsidiaries. From the point of view of the investing public these securities are more readily marketable, but they are subject to the risk of being inflated in value by the holding company without detection.

Chief among the causes which have furthered consolidations and mergers, especially in manufacturing and mercantile industries, are rising overhead costs, which threaten to outrun profits unless business is done on a scale which distributes them over a great volume of units. Costly machinery, which becomes obsolete with alarming rapidity, technical research and elaborate sales promotion are important and under existing conditions unavoidable elements in overhead. Mass production and standardization in themselves make central financial organization imperative. Many mergers are directed toward single control of valuable processes or of essential sources of supply or of adequate agencies of distribution.

Whether the advantages sought by consolidation actually ensue is dependent less upon size or complexity or capitalization than upon skill of management. To be successful the companies combined must form a logical whole which profits from a common general staff and unified methods of operation. There is in combinations a danger of overfunctionalization, which eats up the anticipated savings. Personal loyalty and devotion of officials are more difficult to retain in large than in small corporations. Even under favorable economic conditions the net income of a consolidation in its first years is likely to fall below the previous aggregate earnings of the member companies. Unless this probability has been taken into account in the decision as to the amount of bonds to be issued, the consolidation will experience financial difficulties.

The immediate causes of embarrassment to a corporation may have been ill judged price cutting or overextension of sales promotion or payment of interest or dividends disproportionate to earnings; the underlying cause is always lack of financial ability on the part of its directors. When such financial embarrassment

occurs it is not practicable for a new management to take over the assets of a large corporation for the benefit of creditors, as too many conflicting interests are involved; and the chief values of the enterprise are destroyed if operations are stopped, the organization is broken up and the good will abandoned. Hence it is customarily reorganized, either publicly under a legal receivership or privately by a friendly committee, usually associated with the management, before the difficulties become apparent. Reorganization involves a reduction of activities and refinancing. Three factors are important to the final outcome of such reorganizations: economic motives govern decisions affecting profits; legal requirements determine procedure; but most influential are the human ambitions, antagonisms and friendships which underlie every financial episode.

A reorganization without compulsory sale, even though a receiver is appointed by the courts, is called voluntary; the great majority are of this type. In general the procedure involves the appointment of a receiver who assumes management of the business during reorganization but makes contracts or large expenditures only on authorization of the court. At the same time committees of creditors, bondholders, stockholders and all interested are formed, from which a general reorganization committee is selected. This committee authorizes investigation of the financial situation by auditors; of legal matters affecting abrogation of contracts, pending suits and the like by lawyers; and itself lays out the new financial plan, to which it must secure the agreement of the opposing interests.

Since the public cannot be interested in the securities of an unsuccessful enterprise, new funds can be secured only by substantial sacrifices, chiefly on the part of stockholders. In the course of a reorganization common stockholders are likely to be assessed for new capital in proportion to their holdings, and preferred stockholders are often paid arrears of dividends in common stock which has become practically worthless. Yet note holders and merchandise creditors are frequently obliged to take 50 percent of their claims in long time securities, and even bondholders may be obliged to accept preferred stock for part or a whole of their lien on the assets of the company, in order that a new bond issue or notes secured by the property of the corporation may provide it with working capital. Even in the case of bondholders their chance of finally receiving a part at least of their

investment is usually better if they consent to such arrangements than if they attempt to block reorganization by insisting on their claims, for legal adjudication of their rights is likely to bring them a very small proportion of the face value of their bonds. Not infrequently the largest creditors assist in refinancing a corporation, receiving in return securities which make them practically its owners. The investment banking house with which the corporation has been associated is likely to be one of the largest creditors and a leader in reorganization plans. However these may prosper, in a great number of cases the original common stockholders are practically eliminated.

CORPORATION TAXES. A large part of the complexity and confusion which at present characterize taxation in the United States is directly traceable to the widespread introduction in comparatively recent years of the corporate form of ownership organization. Before the era of the corporation it was possible to achieve a fairly satisfactory result by requiring each individual to list all of his property, allowing liberal deductions for debts. The result was a rather complete assessment of tangible property and almost no assessment of intangible values. But the system had at least the merit of taxing practically all tangible property and taxing it but once, the tax falling for the most part upon the real owner of the property. The general adoption of the corporate form of organization, involving the convenient legal fiction of an artificial person with powers to hold property, make contracts and accumulate income, which in turn is owned by other artificial or natural

persons often very numerous and widely scattered, has created taxation problems for which no completely satisfactory solution has as yet been found. The corporation has radically affected the adequacy of the general property tax, at least as a personal tax. Moreover, the corporation, which from the beginning was prominently identified with large scale, quasi-monopolistic enterprise not confined in its operations to a single state, presented a special taxation problem in a country with many chartering and taxing authorities of limited territorial jurisdiction.

The introduction of the corporate form created the problem of taxing intangible property, an element of value not commonly taxed before, perhaps because it was seldom sufficiently explicit in the economy of the individual. Thus in addition to the regular taxation of the corporation on its tangible property a new tax, the so-called corporate excess tax, was widely introduced. It imposed a charge upon the excess of the aggregate market value of the securities issued by the corporation over the value of tangible corporate property taxed locally. In some states, instead of an annual tax on the corporate excess which can be justified legally as a pure property tax, resort has been had to more or less arbitrary flat rate annual taxes on capital stock, which are defended legally as excise or franchise taxes imposed for the privilege of owning property and carrying on business in the state. In a few cases this annual franchise tax has been based on net income, the tax being in lieu of a property tax on intangibles and in some cases, New York for example, in lieu of a tax on tangible personality as well. In some cases, as in California, a corporate excess tax has been legally described as a franchise tax.

The corporation also raised the question as to whether the corporation itself or the shareholders should be assessed and taxed. For a number of legal and practical reasons the answer given was that both should be taxed. Thus the securities, which are mere paper evidences of interest in the corporation already fully taxed, were almost universally subjected to full taxation through the individual owners. In some states, it is true, concessions were made in the case of securities of domestic corporations owned by residents of the state, but this policy offered only slight relief because it proceeded on the assumption that the taxes paid by a foreign corporation to its home state contrib-

uted nothing toward the discharge of a resident's tax obligation in his own state.

With wide variations existing in tax practices and tax rates from state to state a situation of great complexity and of almost intolerable discrimination developed — a situation which might well have seriously discouraged the growth of the corporate form of organization had it not been for the ease with which the individual could evade his legal responsibility to report his holdings of securities to the assessor. The practical result has been the virtual nullification of the laws imposing full property tax rates on stocks and bonds in those states which still persist in their efforts to list them. A considerable number of states have attempted with indifferent success to mitigate the situation by placing such securities in a special class carrying a low rate of tax or have abandoned the attempt to tax them at all as property, merely including the income in the personal income tax base. For the country as a whole, however, the existing situation may still be described as extremely unsatisfactory.

Very early in the history of corporate development the states came to appreciate the revenue possibilities of a system of fees which could be imposed for the privilege of receiving a corporate charter or, in the case of a corporation with a charter in another state, for the privilege of qualifying to do business in the state in question. Liberality in grants of powers and freedom from onerous restrictions, on the one hand, and the reasonableness of incorporation fees, on the other, have been commonly stressed in the lively competition which has developed among the states for the business of supplying articles of incorporation. Among the states which have been favored by those seeking articles of incorporation New Jersey was for many years prominent for its especially large revenue derived from this source. The stress of competition from other states has tended, however, toward a reduction of such fees to rather nominal amounts.

In addition to the various state taxes on corporations there exist also federal corporation taxes. In the absence of a general provision for granting federal articles of incorporation there is no system of federal incorporation and license fees. In 1909, however, the federal government availed itself of its privilege of imposing on corporations an excise tax measured by net income. This tax disappeared in 1913 with the adoption of the general federal income

tax, which continued to tax corporations as such but permitted a partial offset in the individual share owner's tax in the form of a reduced rate on dividends. Since 1913 the rates imposed on corporations and the offset given individual shareholders have often been changed and at times the discrepancy between the two has been so substantial as to constitute in effect a heavy corporation tax. During the World War an additional tax was imposed on corporations, based on the value of the capital stock, and except during a short period after its introduction the excess profits tax was exclusively a corporation tax. Both of these taxes have now disappeared, but the differentiation under the federal income tax still remains.

Corporation taxes in the narrow sense seem destined to decline in importance. The trend of opinion seems to be definitely in favor of transforming the existing franchise taxes on corporations into comprehensive business taxes, based on net income and applying to all business to individual proprietorships and partnerships as well as to corporations. Some sentiment, however, exists in favor of substituting sales taxes for net income taxes in this field. Organization taxes and license taxes may be expected to remain but their fiscal significance will probably decline. With continued progress toward the objectification of the property tax the most troublesome problems will consist of the treatment of corporations under the personal income tax. Until individual accounting is refined and perfected to the point where accurate annual valuations of individual interests in corporations are available, it will probably be found necessary to include as a part of a personal income tax system a direct levy upon the corporation to compensate for the privilege of reinvesting its profits rather than distributing them as dividends.

In industrial Europe the advent of the corporation found the tax systems in a state of development different from that in the United States. In Switzerland, it is true, a form of the general property tax existed and still persists, giving rise to problems very similar to those in the United States. They have been attacked with indifferent success, although double taxation as among corporations has been largely avoided. In England, where the income tax dates back to 1842, the corporation has been effectively utilized as an agency for collection-at-source for the tax on income from interest and dividends. Influenced by the example of the

United States with its heavy taxes on corporations as such, England in 1920 imposed for the first time a true corporation income tax but the outcry from those who objected to a tax on earnings "ploughed back into the business" was so great that the tax remained in force only until 1924. In France, as in England, there are no property tax complications, but corporate profits are subjected to the commercial and industrial profits schedule of the income tax and in addition dividends are heavily taxed as *valeurs mobilières* under the system established in 1872. In Germany a heavy discrimination against the corporate form has developed. Under the tax legislation adopted in 1920 and amended in 1925 a corporation is subject to the *Körperschaftsteuer* at a basic rate of 20 percent on its net income, and the dividends are in addition subject to the full personal income tax rates. Similarly under the *Vermögenssteuer* (net fortunes tax), not only is the corporation itself subject to the full rates but the shareholders must also submit to half rates on the value of the holdings. It is apparent that in Europe as well as in the United States the problem of corporate taxation has not been found easy of solution.

In the United States special circumstances have made it desirable to tax certain groups of corporations, notably the public utilities, insurance companies and banks, by methods and standards different from those commonly applied to corporations in general.

The public utilities pay the usual type of organization or license taxes based on capital stock, a tax on tangible property and in addition often one or more franchise taxes and special franchise taxes bewildering in their complexity. New York furnishes an interesting if extreme illustration of the confusion which sometimes results. The multiplicity and complexity of the taxes are due to the peculiar difficulties of assessment offered by such enterprises. The traditional technique of valuations by local assessors soon demonstrated its inadequacy when applied to the specialized property of vast public utility enterprises, and the assessment of such properties, particularly railroads, was one of the first functions to be assigned to a central state authority. Indeed, in 1928 in only two states were local officials given authority to assess the intangible element in public utility property and in all but eleven states the assessment of tangible property was the function exclusively of central state officials. The

difficulties of assessing intangible value are of course much greater. While in all but three states the tangible property of utilities is assessed on the same basis and at the same percentage of full value as other tangible property, many special methods are used for determining the intangible value. The valuation of the property of the company as a whole, one necessary step, is accomplished by methods highly flexible, almost infinitely varied and seldom frankly exposed; at present the capitalization of net earnings seems the most popular basis. The allocation of the total value among the states into which the activities of the utility extend is accomplished by the use of arbitrary criteria, such as track or wire mileage, gross receipts and the like, with results which leave a great deal to be desired from the point of view of both equity and uniformity.

There have been several efforts to avoid the complexities of property and franchise valuations and to achieve simplicity through the substitution of net income or gross receipts for property as the tax base. California, for example, since 1911 has imposed a state tax on the gross receipts of its public utilities and has exempted all the operative property of such corporations from local taxation. Legally, however, this plan does not represent a departure from the property tax system since the gross receipts tax is specifically held to be in lieu of the property tax and is levied at rates which are supposed to result in a burden on the property of the utilities, tangible and intangible, equivalent to the tax burden imposed on property in general. Although the routine administration of the California gross receipts tax is exceedingly simple, the determination of the tax rate has proved to be a problem involving great expense and legislative turmoil. In 1929 an official tax commission recommended that the gross receipts tax on public utilities be abandoned, that the real estate of the utilities be valued by a state authority but returned to the localities for taxation and that the net income of the utilities be taxed by the state at a low rate. A similar plan has recently been recommended by an official Utah commission. In New York state a legislative committee in 1922 proposed a "gross-net" plan for taxing public utilities which contemplated in addition to real estate taxes a tax on gross receipts, the rate of which would have varied with the ratio of net to gross earnings. This plan has been

recommended for general adoption by a special committee of the National Tax Association.

The future of public utility taxation appears to depend largely upon the degree of success achieved in the public regulation and control of the rates charged by the utilities. Undoubtedly the utilities will continue to be called upon to pay property taxes on their real estate and perhaps also on their tangible personal property; such taxes would be allowed as expenses in determining the rates to be charged for their services. But it seems probable that in place of the present complicated array of taxes on intangibles and franchises some new type of tax will be evolved especially designed to supplement the system of rate regulation by recovering for the public at least a share of any excessive profits which may accrue to the utilities because of the necessary crudity of the rate scales fixed by public authority. On the other hand, if the present efforts to regulate and control public utility charges should result in failure and the alternative of public ownership should be generally adopted, the problem of the taxation of utilities would probably disappear through the exemption of all the property of the utilities or at least the intangible property.

Similarly, in the case of insurance companies the usual methods of corporation taxation have been found inadequate because of peculiarities inherent in the insurance business. The stock of the insurance company is usually closely held and seldom dealt in, and its property is usually invested in intangibles of a type either legally exempt or difficult to discover and appraise. An effort to utilize property as the base threatens to distort investment policy and to result in unsound practices in an effort to achieve tax advantages. Moreover, since the insurance business is highly competitive and each state has been eager to protect its home insurance companies against heavy taxation in other states in which such companies desire to do business, there has been a highly interesting development of reciprocal and retaliatory provisions which are designed to secure equality of taxation. A simple, easily determined base, supplying a rough but generally satisfactory test of the weights of the taxes imposed by any state, is necessary to facilitate the operation of such provisions.

Net income as a tax base presents even more difficulties than property. Even those states which have adopted net income as the measure

Mommsen and the *Novels* by R. Schoell and G. Kroll.

The *Institutes* may be regarded as a general introduction to the whole work, although it followed the first issue of the *Codex*. It is a general survey of the field of Roman private law and may be described as an elementary law school textbook. The members of the commission who prepared it were law teachers—Theophilus of the Constantinople school and Dorotheus of that of Berytus—and their production was notably different from the other parts. Law books known as *Institutiones* were quite familiar to the Roman public, the term having been borrowed from elementary works on rhetoric. Such *Institutes* had been written by the great Ulpian and by Callistratus, Florentinus, Marcianus and Paulus. But the most successful, if not the most scientific, of these treatises was that of the "law coach Gaius"; and its vogue as a textbook for nearly four centuries naturally made it a model, as well as an important source, for the new work. But its contents were not borrowed bodily. Obsolete matter was eliminated and new legislation substituted with a view to stating the then existing law. Indeed, the method known as interpolation, which will be found to have been so extensively employed in preparing the *Digest*, was also used by the draftsmen of the *Institutes*, and in some instances where Gaius purports to have been taken over literally changes more or less important appear in the text.

The *Digest* is by far the most important part of the Justinianian compilations. While the *Institutes* recited the law for students and chiefly stated general principles, the *Digest* was intended for practitioners and judges and contained the law not only in much greater detail but also in concrete form, important points being clarified and illustrated by *responsa* of jurisconsults and imperial constitutions, really prepared by jurists. Thus while the *Digest* has been compared to a modern code it more nearly resembled a modern casebook with the cases stated in condensed form. This made it more valuable to the lawyer but less intelligible to the layman and led eventually to the preparation of abridgments like the *Ecloga*.

In the *Constitutio de auctore* providing for the *Digest* Justinian commanded Tribonian "to collect from the works of the ancient sages." While this injunction was literally followed to the extent that no writer within two centuries was used, the early writers were also very much

neglected. Indeed, the *Digest* may be said to be almost circumscribed within about a century from the Perpetual Edict to the death of Alexander Severus. About two thirds of the extracts are taken from Papinian, Paul, Ulpian, Gaius and Modestinus. The extracts in the *Digest* are, however, often not in their original form. Indeed, as Gibbon tells us, "3,000,000 of lines or sentences were reduced in this abstract to the moderate number of 150,000." Changes were frequently made for various reasons: to bring passages up to date and make them harmonize with the law as it actually was; to effect changes in the law; to provide explanations; to afford a place for certain constitutions. Some of the interpolations are entirely freakish—due, perhaps, to dictation from memory. What the compilers really did in such passages was to speak through the mouths of "the ancient sages"—a method common enough among writers of that period. A process of intensive study, beginning with the Renaissance but most productive in our own day since Savigny, has demonstrated the importance of these interpolations to an understanding of classical Roman law. The work of Gradenwitz, Lenel, Eisele, Gerhard Beseler in Germany, of Appleton and Collinet in France and of the new Italian school, which includes Albertario, Riccobono, Ferrini, Rondoni, Sollazzi and Bonfante, has provided a new method of approach to the problem of the interpolations. But, according to Riccobono, interpolations are most common in the first half of the *Digest*, the second half being a more hasty piece of work. In this respect the *Digest* parallels the much later *Epanagoge* and Riccobono has come to believe that Justinian's compilers were really disclosing the internal development of Roman law.

In its arrangement the *Digest* is divided into seven parts, whose contents may roughly be indicated as follows: (1) *Prota*, an introductory part dealing with jurisdiction and parties; (2) *De iudiciis* and (3) *De rebus*, both dealing with various kinds of actions; (4) the so-called *Umbilicus* (middle section), dealing mainly with family law; (5) *De testamentis*, dealing with testamentary succession; (6) having no special name and dealing with a variety of subjects, among them intestate succession, manumission, acquisition, especially by possession, judgment and execution, injunctions or interdicts, special pleas, suretyship; and (7) of a similar miscellaneous character but concentrating more upon criminal law and public law and concluding with

canons of interpretation. Within these parts are inserted fifty books, although a book is often divided between two parts. The books, except xxx-xxxii, relating to legacies, are subdivided into titles, 432 in all, and each title contains one or more extracts of uneven length, the total being estimated at 9142. A glance at the above enumeration of parts alone must suffice to show how illogical this arrangement is when judged by modern standards. Not even the rough classification of Gaius is observed. The discovery of Bluhme has done much to explain the confusion: the *Digest*, as published, was the work not of the whole commission but of three separate subcommittees, one dealing with the *jus civile*, another with the commentaries on the edicts, producing the so-called Edictal Mass, and still another examining casuistical works, the chief of which were Papinian's, thus producing the so-called Papinian Mass.

The *Codex* of Justinian which has come down to us is that of 529, the earlier one of 529 being lost. It is a collection of constitutions (the generic term for imperial legislation) consisting of *rescripta* to officials and others in response to formal inquiries; *decreta*, or decisions on legal points; *edicta*, having the force of law; *epistolae*, letters to various functionaries, etc.; and *orationes*, or proposals to the senate. These represent a period extending from Hadrian (A.D. 117-38) to Justinian himself and aggregate about 4700 legislative items of which 1200—more than one fourth—emanated from the period of the joint reign of Diocletian and Maximian (284-305). The *Codex* has been compared to a modern compilation of statutes, but the comparison is inapt unless limited to such statutes as the English and American statutes at large. Typically the *Codex* contains much more public, criminal and ecclesiastical law than the *Digest*, and of this much was of merely temporary interest.

Because of the character of the *Codex* the question of sources presents little difficulty. The earlier codes (Gregorian, Hermogenian and Theodosian) contained similar collections and were no doubt resorted to for many constitutions. But a comparison of the rescripts among these with the corresponding ones of the *Codex* discloses that the latter have often been abridged. As in the *Digest* the compilers of the *Codex* are believed to have followed the arrangement of the *Edictum perpetuum*. The *Codex* consists of twelve books, which contain material in much the same order as the *Digest* although of a

different character. The books are subdivided into titles, which are composed of *leges* arranged in chronological order, each preceded by the name of its imperial author and of the addressee and followed by date and place of promulgation.

As the *Codex* embodied the selected legislation of three centuries preceding Justinian, provision was made for including the future legislative output in a separate work, to which the appropriate name of *Novellae constitutiones* was given. It contained the important Justinian legislation from 529 on and it naturally extends to a variety of subjects. More of the *Novels* pertain to ecclesiastical law than to any other subject and these are addressed to the patriarch of Constantinople. But important subjects of private law are considered, e.g. intestate succession which is materially altered by *Novel cxxviii*. Most of the *Novels* were in Greek, a few in Latin and some in both languages. A Latin edition, the so-called *Epitome* of Julian, is believed to date from Justinian's time. A fuller Latin version known as the *Authenticum* was in use in the Middle Ages.

The immediate purpose in preparing the *Corpus juris* was to relieve the chaotic situation in which Roman law found itself after more than a thousand years of evolution. That purpose was accomplished, if not in an ideal manner, at least more completely than ever before. But the ultimate consequences of the achievement were even greater and certainly more far reaching than the immediate ones. For the Roman law was now reduced to crystallized form and as such was prepared to survive the cataclysm already raging in the West. What would have been its fate otherwise the lost texts of the great Roman jurists, including those of Gaius, show but too plainly. With the body of the law written down and officially published in numerous editions, however, the dangers of destruction were minimized and the work was slowly assimilated by succeeding generations. In the East it had various successors—the *Ecloga*, the *Basilika* and the *Hexabiblos*—and its influence there was direct and uninterrupted. In the West it was more of a stranger and full recognition came only after the Bologna revival beginning in the eleventh century. But it soon spread through such works as the *Partidas* and was the chief instrument in the reception of Roman law in mediaeval Europe. And when the national legal systems crystallized in the modern era, the *Corpus juris* became at once the inspiration and the model of the new national codes that were

created. Thus its doctrines and principles have entered into and form a great part of the law of civilized nations.

CORRELATION

THIFORY. Correlation analysis comprises that portion of statistical technique which treats of the relation of one variable factor to one or more other variable factors. It measures the closeness of association between the factors and the exact quantitative manner in which

changes in one factor are related to changes in the other or others. The measurement of the degree of association between factors which cannot be assumed to vary continuously is in a sense a simplified form of correlation analysis. The whole subject of correlation may be treated as a refinement of inductive logic to make it applicable in fields where a strict causal or functional relation appears merely as an ideal limit.

The method of simple induction assumes that causal relations between phenomena can be established by observing whether B, the effect, always coexists with or follows A, the cause. A research worker attempting to apply this method would soon encounter several difficulties. In any real situation, no matter how perfectly controlled or rigidly simplified by the experimenter, there are present a multitude of other factors in addition to A and B. In order to make certain that B coexists with or follows A rather than some other factor it would be necessary to reduce each situation in which A and B occurred to a combination of simple and independent factors and by comparing the combinations for a sufficient number of observations to isolate mentally A and B. Four of the methods of induction formulated by John Stuart Mill, those of agreement, difference, joint agreement and difference, and residues, take account of the various conceivable types of combinations and offer a technique of mental isolation.

The achievement of such clear cut results is, however, rarely possible. A research worker can never be certain that he has recognized in his observations all the factors which may conceivably influence B nor that he has reduced these factors to simple and independent elements. As likely as not he will find that while B is in a majority of observations associated with A it is not always so associated. If he has rational grounds to believe that A and B are related he may resort to the hypothesis that the true causal relation exists between some part of A and B or A and some part of B or some part of A and some part of B and that his analysis is not refined enough to reduce A and B to combinations of simpler elements. For practical purposes he may be satisfied to leave the problem of the rigid causal relation unsolved, if on the basis of a sufficient number of observations he obtains a fairly reliable measure of the degree of association between A and B.

The derivation of one such measure is fairly simple. If in the B universe A occurs only as

frequently as in the rest of the general universe,

or, using Yule's notation, if $\frac{(AB)}{(B)} - \frac{(A\beta)}{(\beta)}$,

where β stands for the non-B, then B is clearly not related to A. If, on the other hand, A occurs more frequently or less frequently in the universe of B than in the rest of the general universe, then B is positively or negatively associated with A. The cases of A always occurring with B or never occurring with B obviously present the limiting cases of a rigid causal relation between A and B. The degree of association may therefore be measured by the difference between the observed frequency of association of A and B and the frequency which might have been expected were A and B independent. It is possible to prove that if A and B are not related

then the equation $\frac{(AB)}{N} = \frac{(A)}{N} \times \frac{(B)}{N}$, where N stands for the number of observations, must hold true. The measure of association may therefore be written as $\frac{(AB)}{N} - \frac{(A)}{N} \times \frac{(B)}{N}$; by a series

of transformations it may be turned into the form $\frac{(AB)(\alpha\beta) - (\alpha B)(A\beta)}{(AB)(\alpha\beta) + (\alpha B)(A\beta)}$, which is called the coefficient of association. It varies within the limits of -1 to +1, where unity stands for perfect association or close causal relation and the value zero indicates that no relation between the two factors has been established.

The looseness of association between factors represents but one of the difficulties encountered in applying inductive methods. Another problem presents itself where the relationship between A and B cannot be ascertained by merely observing their concurrence or sequence, however regular that may be. In a great many cases, particularly in the social sciences, A and B may always be present, but in varying quantities. They may vary discretely or continuously, shading by minute imperceptible degrees from the lowest to the highest limit of variation. In the case of discrete variation, i.e. where A may appear as $A_1, A_2, A_3 \dots A_n$, it would be possible to conceive of a close causal relation, if B_1 were always associated with A_1 only, B_2 with A_2 only, and so forth; the various values of A and B could then be treated as new simple factors and a causal relation established between A_i and B_i . In practice, however, such simple cases are rare, nor is it practically feasible to reduce the relationship between continuous variables to strict causality by the method of "concomitant varia-

tion," which presupposes a certain change in A to be always associated with a fixed degree of variation in B. Here again the measurement of the degree of association is substituted for the establishment of a rigid causal relation.

In dealing with the variable factors the investigator is concerned not with the influence of the occurrence of B on the occurrence of A but with the influence of variation in B upon variation in A. Association between variable factors is indicated therefore not by the relative frequency of occurrence of A in the universe of B's but by the relative similarity of arrays of the frequencies of various values of A for the different values of B. In the case of continuous variables each array of frequencies may be treated as a frequency distribution and the degree of association measured by noting the amount of dispersion. When the relationship between A and B is perfectly rigid, to each value of B there corresponds but a single value of A, all of which lie along the same line or curve; thus the scatter of frequencies of the several values of A found in the B_i universes indicates the degree to which the relationship departs from perfect. Moreover, where the variables are continuous the relationship between them may be presented as a continuous mathematical function. In addition to measuring the closeness of relationship correlation makes it possible therefore to establish the exact character of change in the dependent variable associated with a change in the independent variable.

The fact that the relation between the two variables may be presented in the form of a mathematical function is a logical corollary of the tendency to continuity in their covariation. Correlation can therefore be approached not by substituting the concept of association for that of causal relationship but by expanding the concept of causal relation to include not only concurrence and sequence but also covariation. In many instances, particularly in social science, this approach has proved more fruitful because it has permitted the establishment of more complex relationships. After the most probable form of the function has been established, "the curve fitted," the transition to looser types of association can be achieved by measuring the deviations of the observed frequencies from the frequencies that could be expected did the function describe a strictly causal relationship. It follows that the measure of the closeness of correlation depends to some extent upon the type of function employed and that the closeness of correlation is

indicative of the degree of reliance which can be placed upon the equation or graph of the function in estimating the value of the dependent variable from that of the independent variable.

Where the distributions of frequencies of various values of A for B , and of various values of B for A , are of such a type that normal frequency curves can be fitted to them and where the functional relationship between the variables is of a straight line type, the entire distribution of frequencies of A , B , may be represented by a double frequency surface with a definite mathematical equation in the same way that a frequency distribution can be represented by an equation. Such elaborate mathematical treatment, however, has not as yet been found of value in dealing with data of the social sciences.

The technique and formulae most frequently employed in correlation work in the social sciences are best illustrated when worked out in a concrete example. The data to which the correlation methods will be applied are the production of oats in the United States and the Chicago price of oats for the period from 1881 to 1913, as given in "What Makes the Price of Oats" by Hugh B. Killough (United States, Department of Agriculture, *Department Bulletin*, no. 1351, 1925, p. 28). The problem is to establish the relation between the variation in production and the variation in price, as shown in these data. Since both production and prices exhibit a long time trend owing to causes not directly relevant to the production-price relationship, such as the growth of population and the changes in the general level of prices, it is necessary to refine the data by eliminating the trend. If instead of annual figures the data consisted of monthly figures subject to the influence of a seasonal factor, the latter too might be eliminated in preparation for the correlation analysis. When the trend is eliminated, our data are represented by a set of thirty-three observations in each of which the production, expressed as a percentage of the trend value, is paired with the price for the same year, expressed similarly as a percentage of its own trend. The pairing of production and price figures is in this case synchronous, but relationships occur in which an appreciable time elapses before the influence of the independent variable is reflected in the dependent variable. In such situations the necessary passage of time may be partially allowed for by pairing observations for the n th and the $(n + i)$ time interval, i indicating the number of time intervals constituting the "lag" between the dependent and in-

dependent variables. Unfortunately, the period of "lag" is rarely of unvarying length.

The relationship between the production and price of oats may now be studied in three different ways by applying increasingly sensitive methods of analysis. The data may be arranged in a double frequency or correlation table and an approximate inference be based on the change in the distribution of frequencies for the dependent variable (Y) as we pass from the lower to the higher classes in the independent variable (X). The accompanying correlation table for the

CLASS INTERVALS FOR PRICE TREND PERCENTAGES (Y)	CLASS INTERVALS FOR PRODUCTION TREND PERCENTAGES (X)		
	70-80	90-100	110-120
	NUMBER OF OBSERVATIONS		
70-80	—	9	5
90-100	1	8	1
110-120	3	2	—
130-140	4	—	—

oat prices indicates that the means of the price frequency distributions tend to fall as production is increased. Were the available number of observations larger, a more detailed classification could be used and a clearer impression of the relationship derived from the table. As it is, a scatter diagram, or dot chart, in which each dot stands for a paired observation of the corresponding values of the two variables, is apt to prove more illuminating than a correlation table. Thus from the appended chart it is at once evident that as the production increases the price tends to decrease, but that this tendency is not so marked for production above the trend as for production below the "normal."

The relations may be more concisely and definitely expressed by the calculation of the correlation constants, the coefficient of correlation, the regression coefficient and the standard error of estimate. Using the notation M_x for the average of X , M_y for the average of Y , x for $X - M_x$ and y for $Y - M_y$, σ_x for the standard deviation of X and σ_y for the standard deviation of Y , the coefficient of correlation for X with Y may be defined as follows: $r_{xy} = \frac{\sum xy}{n \sigma_x \sigma_y}$. The coefficient of correlation may vary between $+1$, showing perfect positive correlation, and -1 , showing perfect negative correlation. For the oats data r is -0.82 , indicating a marked tend-

ency for crops in excess of trend to be accompanied by prices below trend and vice versa. The coefficient may be interpreted by saying that roughly 67 percent, or r^2 , of the variance of price from trend is associated with the departure of production from trend.

The formula for the coefficient of regression of Y on X is $b_{yx} = \frac{\sum xy}{n\sigma_x^2}$; it measures the average change in Y associated with a change in X. The value of the regression coefficient b_{yx} in this case is -1.37 , which shows that each departure of production from trend is accompanied on the average by a departure of price 1.37 times as large and in the opposite direction. There is a second regression coefficient showing the average change in X with unit changes in Y; its formula is $b_{xy} = \frac{\sum xy}{n\sigma_y^2}$. If the variables are so selected that changes in Y may be expected to follow from changes in X, rather than the reverse, the second coefficient is of limited significance. When the correlation is perfect the regression coefficients stand in the relation of reciprocals, that is, $b_{yx} = \frac{1}{b_{xy}}$.

The coefficient of regression is the slope of the line of regression. There are two such lines: one, whose equation is $Y = a + bX$, indicates the regression of Y on X; and the other, with an equation $X = a + bY$, indicates the regression of X on Y. The regression equation in the case of oats, $Y = 2.37 - 1.37X$, may be used for estimating probable price when only production is known. Thus in a year when production is only 80 percent of trend the probable price would be given by this equation as 127.4 percent of the trend. The regression line shown graphically in the dot chart is drawn to this equation and gives the estimated price for any given figure of production.

The standard error of estimate, S_{yx} , for Y from X is the square root of the mean square deviation of the observed Y values from the values which might be estimated from the regression equation. It serves to indicate the standard error which might be expected if estimates of Y were made for new values of X under exactly the same conditions as prevailed during the period or, more generally, in the universe represented by the sample. The formula for linear correlation is $S_{yx}^2 = \sigma_y^2(1 - r^2)$. The value of S_{yx} in our example is about 11 percent.

The correlation worked out in the example of oats was based on the assumption of a linear relationship between X and Y, or that each given change in X yields the same average change in Y, no matter how large or how small X becomes. In many types of problems this assumption is not justified and the linear regression fails to express the true relationship. Thus even in the illustration used here it is quite evident that when supplies are very short the prices advance more drastically than is indicated by the straight line, and when supplies are very large prices do not fall so low as the straight line would indicate. Such curvilinear regression may be treated by representing the relation by more complicated mathematical expressions or by a free hand curve. The closeness with which the individual observations are represented by the curvilinear functions may be measured by the index of correlation. Its formula is

$$\rho_{yz} = \sqrt{1 - \frac{\sum z_y^2}{n\sigma_y^2}}$$
, where z stands for the deviation of the observed value of Y from that which is given by the equation or graph of the regression curve. As in the case of the coefficient of correlation, ρ may assume values between the

limits of zero and unity. Thus when our data are represented by the free hand curve shown in the dot chart, the value of ρ is 0.91 and that of the standard error of estimate about 8 percent. Use of the linear regression therefore would have understated the closeness of the relation of price to production.

Where the number of observations is considerable a different measure of correlation, the correlation ratio, may be computed without reference to the regression curve. The means of the frequency distributions in the columns of the correlation table (a jagged, discontinuous line), rather than the points on the regression curve, are taken as the benchmarks from which to measure the deviations of the individual observations of the dependent variable. The measure of correlation computed by this method, the correlation ratio, is defined as $\eta_{yz} = \sqrt{1 - \frac{\sigma_{yz}}{\sigma_y^2} - \frac{\sigma_{yz}}{\sigma_y^2}}$

and $\eta_{xy} = \sqrt{1 - \frac{\sigma_{xz}^2}{\sigma_x^2} - \frac{\sigma_{mx}}{\sigma_x^2}}$, where σ_x denotes the

mean of the standard deviations in the several frequency distributions of the dependent variable and σ_m the standard deviation of the means of the several distributions from the mean of the entire distribution of the dependent variable. The limits to the value of η are zero and unity. Since it does not apply to a continuous functional relation, the correlation ratio is of less significance than the correlation index.

Where a variable is associated with several factors varying simultaneously, it is possible by multiple correlation to determine the way in which the dependent variable varies with each of the other independent factors in turn, while simultaneously ruling out or holding constant the variation which is associated with the remaining independent factors. The proportion of the variation in the dependent factor which is associated with all of the independent factors combined can likewise be measured. Multiple correlation is particularly useful in dealing with complex relations where the real influence of one variable factor may be hidden or distorted by the presence of another variable factor with which it is highly correlated. Thus a factor which appears to have no relation to the dependent variable may prove to have a definite relation after the influence of other independent factors has been allowed for; or a factor which appears to have a negative effect may finally be found to have really a positive influence.

Multiple linear correlation extends the simple

linear treatment by including other variables in the regression equation. Thus if in a particular study the relation of corn yields to temperature, rainfall and humidity were to be determined, the separate effects of each might be determined by calculating the constants for the equation $X_1 = a + b_2X_2 + b_3X_3 + b_4X_4$. Even though the three independent factors X_2 , X_3 and X_4 were all influencing yields at the same time, the separate effects of each could be determined by this method. The method assumes, however, linear relations throughout; that is, that each additional inch of water or additional degree of temperature will produce an identical increase in yield, no matter how far they are carried. If the relations are curvilinear and differ with different quantities of rainfall or degrees of heat they may be better expressed by the general relation $X_1 = a + f(X_2) + f(X_3) + f(X_4)$. The curves may be either described by definite equations or determined graphically by the method of successive approximations.

Multiple correlation also provides in the coefficient or index of multiple correlation a measure of the extent to which variation in the one factor is associated with variation in all of the other factors combined; and in the coefficient or index of partial correlation, a measure of the correlation between any two factors, while eliminating the influence of all the others considered. The standard error of estimate for multiple correlation, computed by substituting the multiple for the simple coefficient in the equation previously given, indicates the extent of the variation remaining in the dependent factor after all the independent factors have been allowed for.

In those cases where the data consist of a random sample drawn from a defined universe, statistical measures of standard error and of reliability may be calculated to determine how much confidence can be placed in the conclusions drawn from the sample or in subsequent estimates based upon the relations determined from it. Where the data are not obtained by a random sampling or where they do not represent a specific universe, these methods do not apply. Particularly in the analysis of time series is there great danger of too definite an interpretation. For example, there was little in the history of the period prior to 1914 to indicate how supplies of oats would be related to oat prices while a world war was being fought or while the gasoline engine was displacing horses. New elements are always coming into dynamic situations. So long

as the new elements are relatively slight or the evolution relatively slow, the analysis of the past gives a fairly dependable guide to the future. But when the new elements are of great magnitude or of rapid development, the relations in the new situation may be drastically different from what they were in the old. To the extent that growth is regular and progressive or the change in the relations gradual and continuous the introduction of regressions which shift with time may give some measure of the rate of change in the relationships; but even this device is inadequate when drastic breaks in continuity occur. Generally speaking, inferences from the results of correlation analysis of economic time series as to events in subsequent periods have no empirical probability. Such inferences must be seasoned with the judgment of the investigator.

Although statistical inference can be enormously strengthened by an analysis in which the probable causal factors in the situation under investigation are determined on the basis of already known facts and firmly established generalizations, it must be remembered that the fact of related variation between two factors in a narrowly defined situation is in itself no more than a compact description of the particular situation. A technically high correlation may on further investigation prove to be spurious, that is, caused by a still unrecognized fault in method, or may merely indicate that the two factors are closely related to a third factor not taken into account. Similarly, it is not safe to rule out of consideration in the future factors which have shown no correlation with what has been supposed to have been their effect. Like other statistical methods correlation analysis is merely a tool for the test against observation of the validity of the hypotheses which determine the choice of the variables.

HISTORY AND APPLICATIONS. Although there have been some anticipations of correlation and association in the works of probability theorists and of logicians, the ideas and basic methods of correlation analysis were first developed by the English students of heredity, who were striving for some numerical statement of the relation of the characteristics of descendants to those of their ancestors. Francis Galton, the leading spirit in this development, in the years from 1875 to 1889 gradually extended his technique from the use of correlation tables to the determination of regression lines by graphic means and to a rough measure of the closeness of cor-

relation. He established the "law of regression," which stated that on the average the characters of descendants of unusual ancestors tended to regress toward mediocrity, the average of the race, more than did the characters of their parents. The term regression coefficient, to designate the slope of the line of relation, still carries the imprint of the biometric interests of the founders of correlation method. Karl Pearson, during the nineties, developed the mathematics of correlation measurement, the basis for all the subsequent developments, and in 1896 enunciated the theory of partial correlation. Weldon, Edgeworth and Yule also made important contributions to the early developments. In the subsequent period "Student" and R. A. Fisher have devised more exact criteria for the dependability of correlation results, particularly for small samples. At the same time A. A. Chuprov and his students in continental Europe have been reexamining the mathematical assumptions on which correlation methods are based and evolving a firmer logical basis for them.

Almost from the beginning the application of the newly developed methods was extended by Yule and R. H. Hooker to economic and sociological problems. Attention was given to the correlation of time series, and both first differences and departures from trend were early used to eliminate secular changes. During the decade 1910 to 1920 much pioneer work was done by such leaders as Henry L. Moore and Warren M. Persons in economic analysis, but it was not until after the World War that correlation began to be widely used in social science investigations. After 1920 new rapid methods for working out multiple correlations were developed, which made feasible their more general use; and the invention of workable methods of treating curvilinear regressions for multiple as well as simple relations markedly extended the usefulness of correlation analysis, especially in economic research. Previously interest was centered on the closeness of the correlation. Now that the nature of the relation can be more precisely determined, interest has shifted to the shape of the regression curve or curves, and the measure of correlation has come to be employed chiefly as an indicator of the significance of the regressions obtained.

Correlation technique is used at present in the analysis of many economic problems. The typical relationships studied are those of demand, supply and price, of various cost ele-

ments used in production and resulting output, of land values and the physical characteristics and location of individual properties, of interest rates and subsequent business activity. Correlation analysis is particularly popular among agricultural economists. It is less widely employed by industrial and commercial statistical organizations, although its use in the study of sales quotas and of internal efficiency is growing. It has occupied only a minor position in the study of business cycles, due to the difficulty of allowing for the change in time lag in dynamic and shifting situations. Of economic correlations in general it must be said that the significance of results obtained is limited in a majority of cases: either the universe studied cannot be expected to remain unchanged, or the data represent not a sample but merely specific and unique facts drawn from an evolving and dynamic situation.

Application of correlation methods to political science and to sociology is just beginning, with studies such as the relation of composition of population to proportion of votes cast for a particular party or the relation of education of individuals to their political preferences. Here, as in economics, the social scientist has to deal with dynamic situations and must guard against the temptation to misuse the keen tool of correlation by interpreting his results too broadly or too uncritically.

Correlation was early applied to the study of psychological and educational problems. Spearman and Truman L. Kelley evolved special new methods in this connection, and later there has been an extensive development of special formulae for judging the confidence which may be placed in the results of psychological tests. In the years following 1910 much pioneer work was done by Thurstone and others in education, and at present the literature of correlation on psychological and educational measurements is more extensive than in any other field of social science. Although here correlation has been used mainly to measure the strength or significance of relationships, its use to forecast subsequent performance from the records of past achievements or from tests of intelligence or ability is growing. Moreover, the validity of correlation results established in this field is generally greater than in economic, political and sociological problems, where the dynamic factor is of supreme importance. For example, the correlation between the number of repetitions of a test situation and speed of reaction to it, once

determined for a particular species, might be considered representative of all other samples which might be drawn from that same species under similar conditions. Likewise the correlation between intelligence scores on different tests or between the ability to learn algebra and the ability to learn spelling might be considered as generally representative of the particular universe of individuals from which the sample was drawn.

American scholarship in the past generation has taken the lead in applying correlation to social scientific data on a large scale. A great deal was expected of this new device developed by biometricians for physical measurements, and some valuable results have been achieved. Only recently has it come to be recognized that American workers were altogether too prone to make extensive calculations without sufficient regard to the reliability or adequacy of the data used and to the logical significance of the factors considered or without adequate analysis of the significance of the results obtained. The greatest progress in the future must therefore lie in learning how to use skillfully and logically the methods of correlation analysis which are already available, rather than in devising still more complicated formulae and methods of computation.

CORRESPONDENCE SCHOOLS are an aspect of the modern movement which is directed toward the provision of formal education for adults. They flourish where belief in the possibility of advancing personal fortunes through increased competence makes vocational training seem desirable to many, or where the lack of personal resources and favorable local environment makes large numbers of people with some

leisure dependent on a distant center for cultural guidance and stimulation. Their existence indicates the insufficiency of ordinary schools for adults to meet the existing or creatable demand.

All correspondence instruction methods are basically similar. A central organization distributes texts and sometimes other material by mail. Texts are supplemented by printed or mimeographed lesson, problem or question sheets. The students work at home, sending written papers to the central organization which, ideally, provides readers to examine and correct them and to answer questions. Students may enrol and begin study at any time. Each progresses as rapidly as his leisure and ability permit. The better schools attempt to encourage regular work by letters of encouragement and in a few cases by sending a field agent to call on the student.

The earliest institutional attempt at instruction by correspondence was made in Berlin by Charles Toussaint and Gustav Langenscheidt in 1856. Although correspondence instruction was also known in England and France before 1900 and has latterly spread to other countries it has never attained great importance except in the United States. Here early attempts at it were made by the Boston Society to Encourage Studies at Home in 1873 and the Correspondence University launched at Ithaca, New York, in 1883. In 1879 Dr. William R. Harper began correspondence instruction of Chautauqua students, and in 1892 as president of the University of Chicago he established a correspondence department in that institution. An independent development was the home study course which in 1891 grew out of the practise of the Shenandoah, Pennsylvania, *Mining Herald* of publishing daily information on mining problems. Its popularity led T. J. Foster, editor of the paper, to offer courses on mining and related industries and to establish the International Correspondence Schools of Scranton, Pennsylvania.

In 1929 more than 150 academic residence institutions had an enrolment of about 150,000 students in their correspondence instruction departments and about 300 privately owned correspondence schools proper an active enrolment of about 1,250,000. The schools ranged in size from those run by one person with half a dozen students to others with staffs of several thousand instructors and other employees and 100,000 or more students. Almost all aimed

and few failed to realize a profit from students' fees. Some state universities received state grants in aid for their correspondence departments. The estimated annual income of the non-academic schools was around \$70,000,000 in 1926. Several were capitalized at from \$5,000,000 to \$10,000,000 and paid dividends as high as 10 percent.

Some schools offer only one course, while the University of Chicago lists about 450 and the International Correspondence Schools about 300. On the whole, the academic schools specialize in cultural courses paralleling those given in residence (English, history, languages, mathematics, poetry, economics, theology) and generally credit correspondence study up to one fourth or one half the total required for a bachelor's degree. The non-academic institutions specialize in vocational subjects. They offer both courses of limited scope, such as automobile mechanics, banking law, comic strip cartooning, fruit growing, plumbing and tractor repairing, and sets of courses planned to equip the student with broad training in such fields as electrical engineering, accounting, factory or bank management, or for a general business career. They sometimes grant certificates or even degrees.

Economic advancement through the acquisition of technical training is the object of most vocational correspondence students. Many business corporations cooperate with correspondence schools in providing technical instruction to employees, in some cases sharing costs and basing promotion on successful completion of study. Employers' organizations in several fields have instituted correspondence instruction for employees. Many individuals threatened with technological unemployment resort to correspondence instruction to prepare for a transfer of occupation. The demand for new skill which arises from time to time (e.g. the demand for automobile mechanics twenty years ago and radio mechanics five years ago) has been met partly by individuals trained by correspondence schools. But while correspondence instruction has played a role in industrial and commercial evolution by filling gaps in the vocational instruction system, it is easy to overstress the notion that the growth of such schools reflects the need for trained workers. Their enrolment exceeds the demand for skilled workers in various occupations, and if they have not gutted the market that has perhaps been due to the fact that so many students never complete the

course for which they enrol. One investigator reports that in a leading school only three in every hundred do so. While many abandon courses because they have achieved their object by means of the rudimentary training already acquired, others finding the work too difficult cease their effort at "self-improvement" by correspondence study.

Intellectual cultivation is the object of most non-vocational correspondence students, although in many cases (especially those of school teachers) there is an underlying hope of deriving economic or social benefits from the acquisition of cultural graces, credits or a degree. The average non-vocational correspondence student seems to be a person of some leisure and means. Non-vocational correspondence instruction has flowed into the cultural vacuum of middle class American existence. The culture acquired may be no more than a set of standardized notions about current novels or the latest fad in psychology, or the student may reach out for a genuine liberal education.

The development of the two types of correspondence instruction has been far from spontaneous. Almost all correspondence institutions conduct elaborate promotion campaigns, and no analysis of their growth which overlooks this factor is sound. According to an official of a leading school, rapid growth did not come until after the employment of salesmen. One school spends but three quarters of a cent from every dollar of income for instruction, and the rest of its expenditure goes for promotion. In a hundred schools examined by an investigator the promotion staff was about five times larger than the teaching staff. As much as one third of all income is spent by some schools on direct mail, newspaper and other advertising. Without such promotion correspondence schools would never have achieved their present popularity. Their advertisements strike repeatedly the following notes: they inform the reader that to him who will prepare himself the road to financial or social success is open; they reprove him for not giving his wife and children "the best of everything"; they charge him that if his status is lowly it is because he has no training and that if he will but muster enough ambition to enrol for a course in French, modern drama, plumbing, radio or practical psychology he may achieve social success, middle class security or even great wealth. By means of such advertising the traditional American idea of equality of opportunity—the idea that

any bright boy may become president—is re-furbished and perpetuated. The energetic or gullible are induced to concentrate on achieving personal success by means of self-improvement; those who fail as well as many who may never enrol for a course are impressed with the arguments of correspondence school advertisements and are led to view their lowly status and dim prospects as the effect of personal shortcomings rather than as aspects of a general social problem.

Until recently there was almost no regulation of correspondence schools by any government body. Such as exists today is largely perfunctory. In such a situation the possibility of large profits encouraged the establishment of many schools despite their inability to give any serious instruction. While instructors and study material provided by some correspondence departments and schools are comparable in quality to those available in reputable residence universities or technical schools, in others the instructors are clearly unfitted for their work and the study materials are plainly shoddy. Intense competition quickly led to questionable practises. Some schools claimed in their advertisements advantages both absolute and relative which were plainly impossible. Specious offers of reduced fees "for a short time only" were made; "added inducements," such as a free camera, were held out, "testimonials" of satisfied customers and enrolment figures were faked, such phrases as "personal instruction" grossly misused. Students were admitted to courses who could not possibly benefit from them because of their lack of qualification. Worthless diplomas and job guarantees were distributed. A few years ago such practises brought correspondence instruction into such disrepute that the older and more responsible institutions undertook to restrain the blatantly fraudulent. As a result of prosecutions and attempts to regulate by local laws and through the Federal Trade Commission many "diploma mills" were closed and some of the worst frauds abolished. In 1926 the National Home Study Council was founded to promote "sound educational standards and ethical business practises within the home study field"; this organization is financed by and gives its endorsement to a number of the most reputable correspondence schools.

The pedagogical potentialities of correspondence are hard to determine. It is plainly possible to teach many, although not all, vocations by correspondence. The almost unanimous view

of academic educators that a so-called liberal education cannot be imparted or fostered by correspondence must not be accepted at its face value. It seems clear that in the academic fields some subjects may be satisfactorily taught in this way and that for those without means or opportunity for anything else correspondence instruction in almost any subject has positive value. This judgment applies with special force to correspondence instruction instituted by government bodies in the United States, Canada, Porto Rico and Australia for members of the army and navy, children of lighthouse keepers, isolated settlers and the like and in Soviet Russia for peasants in remote regions. The correspondence departments of several prominent universities (Chicago, for example) have taken the position, despite the views of many residence course instructors, that correspondence courses are better than residence courses because "personal attention is more nearly realized," but no university has abandoned its residence classes. Until a comparative study of the effects of correspondence and residence education has been made it must remain an open question whether the shortcomings which are attributed to correspondence instruction in non-vocational subjects, such as superficiality and standardization, are peculiar to correspondence or general in the American educational system.

CORRUPT PRACTISES ACTS. The term corrupt practises acts has come to include not only those laws which aim to prevent bribery, intimidation and fraud at elections but also the so-called publicity laws and the laws which regulate campaign funds in various other ways. Strictly speaking, a publicity law is not a penal statute whereas a corrupt practises act is. But regardless of this technical distinction it is now common usage to include all laws relating to campaign funds under this heading.

Although many American states had constitutional provisions and laws against bribery and intimidation in connection with elections before 1890, the growth of American corrupt practises legislation dates from the passage of the New York law in that year. This law and other state laws which followed were modeled more or less after the English Corrupt and Illegal Practices Act of 1883. By the close of the century seventeen states had passed laws. The revelations concerning the party campaign funds in the presidential election of 1904 focused public attention upon the question and gave an important impetus to the movement for corrective legislation. Democratic charges that corporations were supplying funds for the Republicans in order to buy influence with the administration, coupled with the exposure of corruption in business and politics by the "muckrakers" and the prevalent antitrust sentiment, contributed to the passage of the first federal law in 1907, which forbade contributions by corporations to party campaign funds. Two years later the provisions of the federal law of 1883 regarding the solicitation of funds from federal employees and in federal buildings were reenacted. In 1910 the first federal publicity law was passed; it was supplemented by other federal corrupt practises legislation in 1911, 1912, 1918 and 1925. In addition every state except Illinois, Mississippi and Rhode Island now has some kind of statute or statutes to regulate campaign funds.

The corrupt practises acts in force today sometimes apply only to the nominating process or to elections and sometimes to both. The laws attempt to eliminate corruption by relying upon

certain general principles. Bribery, intimidation and other corrupt election practises, which were crimes at common law, are generally declared statutory crimes. In addition publicity of campaign receipts and expenditures is secured by compelling candidates and political committees to file detailed, itemized reports showing the names of contributors, the size of their contributions, the nature of the expenditures made and the amount expended for each. These accounts are filed with some public officer before or after election or in some cases at both times and are open to public inspection. The federal law of 1925 provides for statements not only before and after elections but also four times in the course of each year, to insure publicity of contributions made to meet deficits incurred in the campaigns.

Another general type of provision in these acts is limitation of the amount of money that can be expended by candidates. A few states also limit total party expenditures. Limitations are sometimes specific in amount, sometimes variable with the salary of the office sought or with the number of electors. The last type of limitation recognizes that there is no absolute limit to legitimate expenditures but that this must vary with the number of voters to be reached. Further refinements allowing for the increased expense of reaching foreign and rural voters have not yet been attempted. The federal law of 1925 combines the specific and variable limitations by permitting election expenditures equivalent to three cents for each vote cast for the office in the last election, with a limit of \$5000 for a representative and \$25,000 for a senator, certain expenses such as personal traveling expenses not being counted toward this amount. In addition, most corrupt practises acts carefully limit political expenditures to certain specific purposes, such as advertising, headquarters, traveling expenses and telephone and telegraph, and in some cases definitely prohibit expenditures for certain purposes. Lastly, the laws restrict the source of campaign funds by prohibiting the receipt of contributions from corporations and in many cases the solicitation of funds from civil service appointees.

Both state and federal laws are so defective as to be unable to prevent some of the grossest abuses. They are inadequate in several respects: they do not provide sufficient publicity; they do not fix responsibility; they do not make it worth anyone's while to enforce them; and they are full of loopholes. The federal law is particularly weak because it fails to reach primary elections.

Apparently the Newberry case caused Congress to avoid extending federal regulation to primaries, even though the decision of the court in that case, by virtue of Justice McKenna's opinion, leaves the question open. The Senate has, however, by using its power to judge of the qualifications of its own members, exercised some control over senatorial primaries, as in the exclusion of Frank L. Smith in 1928 and William S. Vare in 1929 for primary expenditures exceeding a rather vaguely conceived proper limit.

Despite their shortcomings American laws have been of considerable value in raising the whole level of elections. The English laws, however, have been much more effective. The law of 1883 was amended and strengthened in several respects in 1918, 1922 and 1928. The activities of non-party associations were more strictly regulated by the amendments and the necessary changes were made to bring the limits of expenditure to accord with the extensions of the franchise. Although the English law is not without some defects today it has been successful in preventing most of the election abuses. It is safe to say that elections are more cleanly and efficiently conducted in England than in any other country in the world. Party funds, however, are still secret in England.

Germany and France do not possess comprehensive corrupt practises legislation. Bribery is prohibited in these countries, but the word is more narrowly interpreted than in the United States and England. In both countries all electoral funds are secret.

JAMES K. POLLOCK

See: CORRUPTION, POLITICAL; BRIBERY; ELECTIONS; PRIMARIES, POLITICAL; CONTESTED ELECTIONS; CAMPAIGN, POLITICAL; MACHINE, POLITICAL; REGISTRATION OF VOTERS; VOTING; CIVIL SERVICE.

Consult: Pollock, James K., Jr., *Party Campaign Funds* (New York 1926) p. 7-22, 180-280; Sikes, E. R., *State and Federal Corrupt Practices Legislation* (Durham, N. C. 1928); Rocca, Helen M., *Corrupt Practices Legislation* (Washington 1928); Parker, F. R., *The Powers, Duties and Liabilities of an Election Agent* (4th ed. by O. F. Dawson, London 1929).

CORRUPTION, POLITICAL

GENERAL. Political corruption is the misuse of public power for private profit. Not all acts which benefit the officeholder at the expense of the people are corrupt, else the term would include all taxation by an absolute monarch to provide accustomed luxuries for his family and court, all fees and dues paid by serfs to their feudal lords, all sacrifices and gifts given to the

priestly class in theocracies. Acts illegal in themselves and calculated to benefit the officeholder are obviously corrupt. But neither the question of formal legality nor that of the sufferance of the act by the mass of the people is of the essence of the concept. Where the best opinion and political morality of the time, examining the intent and setting of an act, judge it to represent a sacrifice of public for private benefit, it must be held corrupt.

No political group has been entirely free from jobbery, but corruption has not prevailed to an equal degree at all times or under all conditions. It has responded to varying opportunities for the misuse of power created by particular governmental institutions, to psychological drives present in the contemporary cultural milieu, to pressures arising under the existing scheme of economic arrangements. Any analysis of its prevalence must therefore regard corruption as a phenomenon of group psychology, conditioned by the entire cultural setting of the group; and no remedial program can be successful if it limits itself atomistically to prosecution of individual offenders or even to administrative reorganization.

Corruption presupposes the existence of public officials with power to choose between two or more courses of action, and the possession by the government of some power or wealth or source of wealth which can be taken or used to private advantage. Even relatively simple societies contain these prerequisites. What we know of primitive society suggests that on the whole corruption is scarce, primarily because of the dominance of tradition in determining conduct and the immediacy of control which is possible in the usual small unit. Among many African tribes, however, the political unit is large, the government is monarchical, court procedure gives considerable power to the king and his council, and fines are retained in whole or in part by the king, his council or his attendants. The presence of all these prerequisites for certain types of jobbery results in the appearance of corruption, notably among the Ho-Ewe, the Dahomi and the tribes of Yorubaland.

The bribery of judges appears as a problem in the history of the Egyptians, Babylonians and Hebrews. The sons of Eli used their position as priests to extort more than their share of the sacrifices from the people. Among the Greeks corruption was rather slow in developing. Government was on a relatively small scale in the city-state, a professional political group ap-

peared late, and the citizens evidenced an effective interest in their government. But by the fifth century B.C. bribery of Greek officials by foreign powers was common. Extreme corruption came with the increased economic activity and the political apathy of the fourth century B.C. New opportunities for speculation and bribery appeared in the increased wealth of the state, while the interest of the citizens in their government waned and attendance at public meetings had to be stimulated by payment.

In Rome too venality did not appear on a large scale until indemnities, tributes, spoils and colonial revenues increased the wealth of the republic. The policy of considering the dependencies solely as sources of revenue for the republic was copied by the unpaid governors, who exploited the provinces shamelessly for their own profit. Bribery was common in public elections, in the senate, in the courts. Public contracts of various kinds furnished an income to the contractors and to the officials charged with letting the contracts. The sources of public revenue—gold mines, salt mines, forests, customs and taxes—were farmed out to companies who used every available means to obtain the contracts and extorted all they could under them. Under the empire the rapacity of provincial governors and of tax farmers was somewhat restrained, but a new evil was introduced in the open sale of public office on a hereditary, freely transmissible basis. The elements most likely to revolt under the prevailing system of corruption were carefully bribed—the army with money, the populace with “bread and circuses.”

In all these forms of jobbery Roman political life was foreshadowing future developments in the political life of the world. Not all the forms continued unchanged in detail in subsequent history, and their relative importance changed in response to peculiar conditions which favored now one form, now another. During mediaeval times the principal forms of corruption were probably the extortion of revenues by central and local administrations and the perversion of justice. The courts of kings and feudal barons tended to become instrumentalities serving the pecuniary interest of their patrons. In England even the common law courts developed corrupt practises, and the charges against Bacon indicate that the institution of the chancellorship was not an adequate remedy for the injustices of the common law courts. In France the fifteenth century witnessed the restoration of the sale of judicial offices.

The age of exploration and colonization re-established the conditions which had produced the exploitation of the provinces under the Roman Republic. Spanish and Portuguese colonial governors enriched themselves through their almost absolute power over colonies far removed from the central governments, which were corrupt and interested in the colonies only for the revenue to be derived from them. The officials of the British East India Company in India amassed fortunes by a variety of venal practises.

Lecky has said that "it is probable that the moral standard of most men is much lower in political judgments than in private matters in which their own interests are concerned" (*History of European Morals*, 2 vols., 3rd ed. London 1877, vol. i, p. 151). It is doubtful whether political morality is worse than average business morality. The increasingly frequent contacts between the two types of morality in the modern state has reproduced and surpassed some of the worst features of Roman political corruption. Attempts to control trade in accordance with the principles of the mercantile system and the continental system produced well developed mechanisms of smuggling, in many cases allied with official corruption. The grant of monopoly rights has frequently come as a result of extensive bribery, as in the cases of the British East India Company and the South Sea Company. In the early nineteenth century corporate charters, especially in the United States, were obtained by notoriously corrupt methods, while the mere right to list the stock of the *Suina Viscosa* on the Paris bourse was obtained under conditions which led to the downfall of the Tardieu ministry in 1930. In general, attempts to prohibit or control lucrative business activities—the sale of alcoholic liquors and drugs, the formation of trusts, the exploitation of public utility enterprises—have produced jobbery and evasion.

Business and government have also been placed in direct relationship with each other through the various government contracts, which have become increasingly important with the growing scale and scope of governmental activity. Particularly conducive to corruption are contracts for military supplies, especially in time of war. In modern times war has increasingly involved the expenditure of tremendous sums of money under conditions of relaxed public control. Public attention is focused on the battle front and on supplying the soldiers with

everything they may need regardless of cost. After the war surplus war materials are disposed of at a trifle of their cost. Recognition by business men of the opportunities for tremendous profits increases the strain upon the honesty of public officials. The fortune which the Duke of Marlborough is alleged to have made out of illicit war contracts while commanding British troops, the wire pulling by members of Parliament in the latter part of the eighteenth century to obtain contracts for themselves, the scandals which followed the Boer War, are examples in point.

Bribery of voters and of legislatures largely disappeared from the Roman Empire with the increasing power of the emperor—"one does not bribe where he can browbeat." It reappeared in Europe with the rise of representative assemblies to power, especially over finances. Charles V bribed the Cortes to vote him finances, William III and George III of England manipulated elections and bought votes to secure financial support in Parliament. Similarly, the manipulation of elections by Magyars in non-Magyar districts of pre-war Hungary was a confession that old methods of oppression could no longer stand in the face of the rising tide of democracy and that new devices were needed to keep down minority groups.

If bribery was sometimes employed to sustain the waning power of a decaying monarchy or aristocracy, it has also been employed as an opening wedge by a new class seeking political power and social prestige commensurate with its economic power. The nabobs of England bought seats in the Commons, partly to protect their fortunes in the East India Company, but primarily because it afforded them an entrance into a select social circle and was a stepping stone to the even more coveted House of Lords. The sale of honors which still forms one of the important sources of party funds in England rests upon the same desire of wealthy industrialists for social recognition. The willingness of millionaires to lavish fortunes upon senatorial campaigns in the United States is reminiscent of similar activities by wealthy Romans under the empire.

Corruption is not restricted to western peoples. In Japan the naval scandals of 1914, the bribery of members of parliament during the second Okuma ministry and the widespread corrupt election practises which the act of 1901 has proved powerless to stop evidence the existence of jobbery. The situation is even worse in China.

Public offices are bought for profit, tenure of office is uncertain because of the constant danger of revolutions, control by the central government is slight. Fortunes are amassed by extortion and embezzlement of funds obtained from taxes and from foreign bankers, ostensibly for public improvements. The multiplicity of generals with their mercenary followings adds a further element of extortion, while brigandage is frequently winked at by public authorities in exchange for proper payment.

Behind the wide variety of penalties for corruption under different governments lie such factors as the influence of tradition, the desire of high officials to eliminate the diversion of funds by subordinates, the consciousness of danger on the part of the dominant class. In England, where a century and a half ago bribery was accepted as a matter of course, mere misuse of a railroad pass resulted in the resignation of a member of Parliament in 1931. In the Egypt of Harnhab judges who accepted bribes were executed; in present day Russia corruptionists of all kinds may still face a firing squad, while in Japan mere demotion from office may be considered sufficient punishment. A private individual involved in bribery generally suffers a less drastic penalty than the public official who has accepted the bribe. The former has acted as an individual, the latter has betrayed a trust reposed in him by the public and has reflected upon the integrity of all members of the public service.

The exposure of corruption may come through individuals or organizations conscientious enough and powerful enough to bring the matter into the open and even to halt it—if only temporarily. More often, especially under the modern party system, exposures result from the desire of the "outs" to obtain power, so that they may themselves enjoy the benefits and perquisites of office. In many Latin American countries, where elections are mere farces, revolution is the only way of accomplishing this change. Revolutions such as those of 1930 are usually announced as attempts to get rid of corrupt officials; ex-presidents may even be convicted of embezzlement, as in the case of Leguia of Peru in 1931. While some improvement in conditions has often resulted from such revolutions, in the past flagrant corruption has generally continued, for the benefit of the new government. The Latin American countries as a whole have never been able to escape from the venal traditions set by the Spanish and Portuguese colonial administrations. The Italy of Mussolini is largely sub-

ject to the same problems of jobbery that faced pre-war Italy.

The tremendous improvements in official morality which the Communist government of Russia has achieved indicate that a violent break with the traditions of the past is possible. But the reason for the change is to be sought less in the fact of revolution itself than in the crusading zeal of the Communist party, which leads it to ferret out and punish severely all corrupt officials. Unless some more permanent force, such as a non-pecuniary system of values or a permanently heightened sense of communal service, arises to take the place of this crusading spirit, which is certain to vanish, Russian official morality may degenerate. The histories of Switzerland and England, however, indicate that countries may permanently and without violence escape from traditions of corruption.

No particular type of government presents a guaranty against corruption. The papacy and theocratic states like the Hebrew state contributed to the broad stream of corruption that flowed from secular states of all types. Certain institutions, however, may serve as aids to honest administration. The development of the civil service, with adequate salaries and permanent tenure, has removed an important source of corruption and tended to develop a professional code of ethics among civil servants. Corruption has largely disappeared from the civil service of the more advanced countries. Government bodies set up for the express purpose of detecting inefficiency and corruption, such as the Commissariat for Workers' and Peasants' Inspection (*Rabkrin*) in Russia, may serve some purpose where their activity is spurred on by some group definitely interested in the purification of government and powerful enough to bring it about.

In last analysis venality can be eliminated only where power to do so is linked with the desire to do so. Little progress is to be expected where those in power either benefit from corruption or fail to recognize the necessity for its elimination. Members of a particular class, having appropriated the resources of the government, may, as in England, demand honest government to protect their wealth. But this class must struggle against a new class of corruptionists developed by the new opportunities for jobbery which are constantly arising. Ignorance of the existence of corruption or of its importance in everyday life, diffused responsibility, widespread benefit derived by a large disinherited element in the

voting population from the lavish distribution of spoils, political apathy and indifference, a pecuniarily minded culture which values all things in terms of money—all contribute to fastening the tradition of corruption upon the political life of a nation.

JOSEPH J. SENTURIA

UNITED STATES. Among the great modern nations the United States has had perhaps the least enviable reputation as regards the probity of its political life. For this the American form of government is partially accountable. Separation of powers promotes an irresponsibility which facilitates corruption; by confusing the governmental process it makes impossible that vigilance which is not only the price of liberty but of political purity as well. The virtually uncontrolled power of the president over the national administration places him in a position to grant favors to his personal and political friends. The appointments and bank scandals under Jackson, the Whisky Ring and the Star Route frauds in the Republican administrations following the Civil War, the oil scandals under Harding, are the logical fruits of a powerful and irresponsible executive establishment. Through his power of appointment and removal the president can, if he choose, control for partisan and corrupt purposes the activities of such agencies as the Tariff Commission, the Shipping Board and the Federal Trade Commission. In the administration of tax laws refunds and penalties can be used to reward or punish. "Give me control of the Internal Revenue Bureau," says Senator Couzens of Michigan, "and I will run the politics of the country."

A similar situation exists in American state, city and county government. Favoritism and discrimination in the use of the taxing power, misuse of funds, contract frauds and job patronage are common evils attendant upon the administrative wilderness which is America. The situation in the state governments is aggravated by the existence of plural rather than single executives. The direct election of numerous executive officers diffuses responsibility. The government of the state of New York, for example, prior to reorganization, consisted of "one hundred and sixty-nine departments, bureaus, boards, institutions, commissions and offices" with no centralized control or responsibility; there were sixteen methods of appointment and seven of removal. There have been in the United States governors who trafficked in

pardons, who employed the state military forces to break strikes for friendly employers, and who used their veto power to defeat legislation unfavorable to their friends. A recent secretary of state for New York, in making the state census, squandered public moneys upon her relatives and friends. A treasurer of Illinois illegally withheld over \$1,000,000 due the state as interest on public funds in his control. Among city governments there are few where the control of taxation and expenditure is lodged in a single responsible head. More than 3000 counties, raising and spending millions of dollars for roads, schools, public health, law enforcement and general welfare, constitute a paradise for speculation. Their government is chaotic, a "dark continent" in American politics. Cook county, Illinois, for example, has thirty-four separate and independent bodies with power to levy and collect taxes.

The complicated nature of the American elective process transfers political control from the voter to the machine. The election of some 50,000 types of officials, varying from president to pound keeper, imposes upon the voter obligations which he cannot fulfil. In Chicago there have been as many as 6000 nominees in a single primary election and a recent ballot in that city carried the names of 257 candidates for fifty-three offices exclusive of presidential electors. Direct legislation creates an additional burden; the San Francisco ballot in 1922 contained fifty-two initiative and referendum proposals. In his bewilderment the voter turns to the only source of guidance he knows—the professional politician. This situation engenders the political boss and his machine, both of which thrive upon political corruption.

The machine fares best in the large cities, whose rapid growth has created a veritable bonanza for corruptionists. Since 1860 the population of Chicago has increased from 109,260 to over 3,000,000, that of New York from 1,174,779 to over 6,000,000 and that of Philadelphia from 365,529 to over 2,000,000. Jefferson, writing to Madison in 1787, said: "I think our governments will remain virtuous for many centuries; as long as they (the people) are chiefly agricultural. . . . When they get piled upon one another in large cities, as in Europe, they will become corrupt as in Europe." James Bryce says of city governments, "they are usually worse when the population exceeds 100,000, and includes a large proportion of recent immigrants." Rising realty values make it possible

for persons "in the know" to make fortunes through judicious speculation, euphemistically called "honest graft." Increasing needs for transportation, water supply, sewage systems, street paving and public buildings create additional opportunities. With annual budgets running into hundreds of millions, with millions in contracts to be awarded and with irresponsibility and confusion in government, corruption is inevitable. The awarding of contracts to friendly contractors, the sale of leases, franchises and other special privileges, even the sale of political and judicial offices, create a well filled party treasury from which the machine can finance its charitable and vote getting enterprises. The great number of foreign born and propertyless citizens in the large cities represent a body of shock troops of the "organization," bound to it by the judicious distribution of favors. Since a large proportion of these regular machine voters pay no direct taxes, they tend to be indifferent to reckless expenditures and feel themselves but remotely affected by corruption in public office.

One of the principal sources of corruption lies in the regulation of public morals. The administration of legislation against prostitution, gambling and the liquor traffic offers an opportunity to the politically controlled police to levy tribute upon the so-called underworld. By overlooking the violations of those who pay and by rigorously enforcing the laws against those who do not, corrupt public servants have a weapon for extorting tribute from those engaged in such activities. The Vice Commission of Chicago in 1911 estimated the annual profit from prostitution at \$15,000,000, out of which \$3,000,000 went to the police. Since the adoption of the Eighteenth Amendment the illicit liquor business has grown to staggering proportions. At a conservative estimate made before a subcommittee of the Senate Committee on the Judiciary, 13,000,000 gallons of industrial alcohol were illegally diverted in 1926. This would make about 39,000,000 gallons of bootleg liquor which even at four dollars a quart would be worth over \$600,000,000. And this does not include profits from brewing, distilling and smuggling. With such profits the bootlegger can afford to be generous in buying protection. Former Mayor Dever of Chicago said in 1926 that when he took office there were between 15,000 and 20,000 places openly selling liquor and that 60 percent of the Chicago police were engaged directly or indirectly in the liquor

business. A Philadelphia grand jury in 1928 disclosed that policemen and detectives were becoming fabulously rich from the business of "selling protection." Police and enforcement officers in that city, it was estimated, collected about \$2,000,000 annually from bootleggers and their allies.

Control of these sources of graft rests ultimately upon victory at the polls. To insure success the machine frequently scruples at nothing. Fraudulent registration, "colonizing," repeating false counts, even violence, are some of the tactics employed. Money is poured into campaigns; in the single Pennsylvania Republican primary of 1926 over \$3,000,000 was spent by the various factions. The bulk of this money comes from business men who in turn expect favors at the hands of the successful candidates.

Natural resources of incalculable value in the possession of the federal and state governments have constituted a standing temptation to corruption. Out of approximately 1,300,000,000 acres of land, including timber, oil and mineral resources, the nation has disposed of all but about 400,000,000. Benjamin Hibbard in his *History of the Public Land Policies* says: "Throughout the history of the public domain, fraud has been prevalent." In the Yazoo land scandal in 1789-95 a whole legislature was bribed and corruption reached even to the national administration. Following the Civil War came the railroad grants under which approximately 190,000,000 acres of public domain were given to railroad corporations. "The immense swamp land grants," says Ise in his *The United States Forest Policy*, "were secured largely by fraud, for the advantage of private individuals having political influence. . . ." Gigantic frauds were committed under the Timber and Stone Act. The Oregon land frauds involved government officials high and low, including a United States senator. The Teapot Dome and Elk Hills oil deals, which were characterized before the United States Supreme Court as having been "consummated by means of conspiracy, fraud and bribery," reached to the very doors of the White House. Most recently the disposal of water power resources by the federal government has involved charges of pressure brought to bear by the power interests.

Beyond the opportunities that the expanding economic life of America has offered to corruption and the defects of American political organization in the control of it, there is the general cultural milieu which has made corruption and

racketeering an integral part of American society. Corruption is in a sense a product of the way of life of an acquisitive society, where "money talks," where that which "works" is justified, and where people are judged by what they have rather than what they are. The growth and consolidation of American business into ever larger units have increased the pressures of private interests upon public servants. But even more important is the fact that they have created a society in which pecuniary values are dominant. In such a society prestige is measured in terms of wealth. Successful grafters and corruptionists become respected, and a million dollars covers a multitude of sins.

For a situation which is the resultant of so complex a set of factors there can be no simple remedy. A good deal can, however, be done through governmental reorganization; certainly without it the power of the machine cannot be broken. A reduction in the number of elective officers with authority concentrated in the hands of a few responsible officials would make the task of the citizen easier and free him somewhat from the domination of the boss. The American belief that any citizen is qualified to perform almost any governmental task throws administration into the hands of amateurs, making "experts" of politicians and politicians of experts. Fortunately this notion is gradually giving way to a recognition of the need for non-political administrative officers. Some little progress has also been made in the adoption of an efficient budget system. The bureau of the budget in the national government is handicapped, however, by the power of Congress over appropriations, and the "pork barrel" remains a familiar institution. Not all "pork" is corrupt. But when a legislator secures governmental favors for his community merely to insure his own continuance in power, he is being politically corrupt. The development of an effective budget bureau, similar to the treasury in England, would be a distinct step forward. To insure greater responsibility it has been proposed that cabinet members be allowed to appear before Congress to answer questions concerning the work of their departments. But such reforms are hardly possible so long as we cling to the fetish of checks and balances. A partial integration is now effected through the appearance, sometimes compulsory, of administrative officers before congressional committees.

Administrative reorganizations are also being effected in many of our state governments. New

York has adopted an executive budget and has concentrated control of administration in eighteen departments under the immediate direction of the governor. Similar reforms are being undertaken in other states and some fourteen have thus far been reorganized. But everywhere the reorganization has been the result of compromise with political, official and institutional interests and nowhere has it been as thorough as the situation requires. Over four hundred cities have adopted the city manager form of government. Through home rule provisions local governments are breaking away from the clumsy control of state legislatures and there is a healthy trend in the direction of state administrative control. Thus in twenty-eight states power is given to state officials to order a reassessment of property whenever irregularities appear. Twenty-two states maintain supervision over municipal indebtedness and six exercise considerable control over municipal budget making. The county for the most part remains *terra incognita* to reform.

Beyond the sphere of administrative reorganization little progress has been made. The conservation policy of Roosevelt and Pinchot has saved several large areas of the public domain from ruthless exploitation, but the application of such a policy has been a belated one. In the regulation of elections, especially of primaries, where the greatest corruption lies, Congress has only a limited power. Permanent registration laws centrally administered by permanent civil servants, better policing of elections, more rigorous corrupt practices acts and the ultimate assumption by the government of the burden of campaign expenses are obvious remedies. But it may well be that the entire machinery of reform represents only a palliative unless it is accompanied by a transformation of the pecuniary standards of American society.

CORTES. See LEGISLATIVE ASSEMBLIES.

CORTÉS, HERNANDO (1485-1547), Spanish conquistador and colonial administrator in Mexico. In 1504 he sailed for Santo Domingo, and after remaining seven years he accompanied Diego Velázquez to the conquest and settlement of Cuba, where under Velázquez' governorship he was an active and popular member of the colony. In spite of a quarrel with the jealous and domineering governor Cortés was chosen in 1518 to command an expedition to follow up explorations of the previous year along the coasts of Yucatan and Mexico. The story of the conquest of Mexico—of the bold march into the

highlands of the interior, of the calculated audacity which overawed Montezuma and his hordes of warriors and of the involved series of events which ended in the capture of the Venice-like citadel of the Aztec in August, 1521— is told most graphically in the five long reports forwarded by Cortés to the Spanish king ("Cartas de relación" in *Biblioteca de autores españoles*, vol. xxii, Madrid 1884, p. 1-153; tr. by J. B. Morris, London 1928). Convinced of the great importance of the newly conquered lands the crown, ignoring Velázquez' charges of insubordination, confirmed Cortés' de facto administration and commissioned him governor and captain general. Of inflexible purpose, never failing resourcefulness and self-control, Cortés excelled over his ill trained and undisciplined soldiers an extraordinary influence. He busied himself with the extension of Spanish settlement in southern Mexico, Guatemala and Honduras and endeavored to save the natives from the unrestrained exploitation which was depopulating the islands. His great administrative ability, combined with the conviction that he was leading a crusade to win heathen souls to the holy faith, transformed the hazardous schemes of a mere adventurer into the matured policies of a constructive statesman. In 1528 he sailed to Spain to face the calumnies of jealous foes. Although he was received with highest honors and made marquis of the valley of Oaxaca with vast estates in the New World, he was deprived of his political prerogatives as governor. Returning to Mexico in 1530 he devoted his attention during the next ten years to the growing of sugar cane, to sheep raising, to silkworm culture and to the establishment of new industries. His scientific and practical interest in the extension of geographical knowledge and in the introduction of European plants and animals, as well as his continuous concern for the preservation of the aborigines, give him a high place in the history of colonial enterprise. He has been called the greatest of the conquistadores, if not the ablest man that Spain produced in that age.

CORVÉE. In its general sense corvée designates a service in labor furnished by one man to another or to a sovereign. In primitive economy

the lack or insufficient supply of money made this a normal form of payment along with the exchange of goods. In more advanced societies it was long retained among slaves and among the poorer classes. Among the Romans the enfranchised slave was still bound to perform certain services for his master; the state also demanded labor from the people of the provinces for the construction of roads, military transport and other public works. In the feudal system the *corvée* was the charge which the seigniors most commonly imposed upon their vassals. The personal *corvée* rested upon personal obligation and often represented the price of a serf's freedom. The real *corvée* was an obligation running with the tenancy of land. There was also the obligation, common to all the vassals of a lord, to assure the maintenance and defense of his castle and to perform in general all work of a public nature. The *corvée* consisted of a certain number of days of work with or without draft animals. At first and for men of the lowest class the number of days required was left to the discretion of the seignior; gradually it became fixed by contract. The increasing liberty of the peasantry and the growing security of existence tended to reduce these burdens, and in France from the fifteenth century on they gradually dwindled to insignificance. They were not, however, entirely abolished until the revolution, when they were suppressed by the decrees of August, 1789, and later by article 686 of the civil code.

Kings as feudal lords naturally imposed *corvées* on the peasants of their own domains, but from early times they claimed the additional right of exacting them from the commoners outside of the royal domain for works of a public character. This was notably the case when the rulers assumed responsibility for public security. These royal *corvées* increased with the diminution of the seigniorial *corvées*. In the sixteenth century we find them employed for military defense, for the forts and for the construction of roads. But up to the beginning of the eighteenth century they were used only temporarily and casually and were a real burden solely in the frontier regions.

It was only when the government from 1726 on undertook the construction of the great royal roads on a large scale that the *corvée* was systematically employed and that it became a normal and very heavy charge upon the peasants. The government saw in it an economical means of carrying out its great work, and this

procedure appeared so consistent with precedent and royal privilege that no legislative act was invoked to impose it. The requisitions were regulated solely by ministerial circular letters addressed to the intendants. The principal one, that of May, 1737, affected all peasants over twelve years of age and domiciled less than four leagues from the road under construction and fixed a maximum of thirty days a year per man. Any satisfaction of the *corvée* by a money payment was forbidden. In practise there were numerous modifications of this general regulation: the intendants were free to reduce the obligations of individuals in their provinces, and the *pays d'états*, or royal provinces, which enjoyed a certain degree of financial autonomy, notably Languedoc, Burgundy, Brittany and Provence, were allowed to use paid labor instead of the *corvée* on their roads. In the district of Paris, where the great lords and members of *parlement* had their lands, a money tax was substituted for the *corvée*. But it is certain that wherever it was employed the *corvée* constituted a very heavy burden for those subjected to it. There were local uprisings, mass desertions of peasants and imprisonments. Economists and *philosophes*, such as Argenson, the Marquis de Mirabeau, Ducloux and Voltaire, in their writings frequently advocated the abolition of the *corvée* on the highways. Certain intendants even took the initiative of suppressing it in their provinces. When one of them, Turgot, became a cabinet minister he decreed its general abolition by an edict of February, 1776, the preamble of which sets forth at length the disadvantages of the system. Thereafter the roads were to be constructed by free laborers paid by the king. In order to insure the necessary funds a supplementary tax based on the land tax was instituted.

But this reform aroused the protests of the privileged classes, who were thereby subjected to a new impost, and was the king's chief motive in dismissing Turgot. The edict was revoked by the declaration of August 11, 1776. Nevertheless, the previous system was not entirely reestablished: each parish was permitted to substitute a money tax for the *corvée*, and whole provinces, notably Berry, took advantage of this privilege. Gradually the harshness of the system diminished, and at the approach of the revolution it seemed likely that it would soon disappear altogether. The royal declaration of June, 1787, established the principle of a money tax proportional to the *taille*,

wherever the provincial assemblies of 1787 did not expressly request continuance of the corvée in kind; and this they did in very few cases. The Constituent Assembly entirely abolished all corporal and special impositions in August, 1789, and the Convention added construction and maintenance of roads to the functions of the state, the departments or the communes.

In the year x of the Republic Napoleon re-established the corvée under a new name, prestation in kind. He retained, however, the principle of substitution of money payment at individual option. This form, which did not possess the grave disadvantages of the old royal corvée, continued in force in France until 1903.

In other countries the breakdown of the feudal system led to the abolition of the feudal corvée. In England statute labor on the highways, which never constituted a serious burden, was abolished in 1837; in Scotland it was done away with in 1883. The corvée system was employed extensively in modern Egypt, particularly in the building of the Suez Canal, but since 1891 its use has been practically abandoned.

In the American colonies the inadequacy of the volunteer system of road building soon led to the adoption of the labor tax, instituted at first by town ordinance and later by state law in most of the states. It remained the recognized system of road building and repair in newly developed territory but was abolished with the era of good roads.

COSMOPOLITANISM signifies a mental attitude prompting the individual to substitute for his attachments to his more immediate homeland an analogous relationship toward the whole

world, which he comes to regard as a greater and higher fatherland. In distinguishing cosmopolitanism from the kindred concepts, internationalism and universalism, it is essential to recall that the word received its definitive meaning in late antiquity, and that its currency in the modern languages, into which it passed as a Greek loan word, was most extensive during the Enlightenment. It is thus inextricably associated with the history of these two epochs. To remove it from its historical setting, to apply it, as is sometimes done, to phenomena of a pre-Hellenistic period or outside the stream of western culture, involves a transfer of terminology which lacks precision and is at best only conditionally valid. Likewise caution is necessary when a common term is applied to the cosmopolitanism of late antiquity and that of early modern times.

The nature of cosmopolitanism is fundamentally affected by the ideal of citizenship which the potential cosmopolitan derives from his small social group and transfers to a broader solidarity. For the Greeks, whose conception of polity was based on the democratic city-state, or *polis*, this ideal can be clearly interpreted in terms of a highly developed social and political individualism, confined by no other bonds than a still unbroken religious traditionalism. But the exact meaning which antiquity assigned to the concept of the *cosmos*, by which it denoted the broader solidarity, is at the present time difficult to determine. If it be assumed that the Greeks had in mind something more specific than a vague and negative reaction against the petty Philistinism of the city-state or than an equally hazy generalization akin to a formal universalism, the answer to the problem must be sought in the general intellectual horizon envisaged by the cultured Greek of the time. Nor can the cosmopolitanism of any region or age be comprehended without reference to a similar standard. Thus it can be discovered to what extent, if at all, the varying conceptions of cosmopolitanism have been subject to the psychological law that every hypothesis of a solidarity transcending local or national boundaries conceals a certain consciousness of superiority which individuals attach to their local group, nationality, religious faith, race or culture. The modern Marxian who theoretically looks forward to uniting the proletariat of the entire world is actually concerned only with the narrow sphere of the relatively homogeneous and highly developed nations. Similarly a

penetrating analysis of cosmopolitanism reveals an unconscious limitation of the concept through such distinctions as those between Greeks and barbarians in antiquity and between civilized and primitive peoples in modern times. In order to grasp the real spirit of cosmopolitanism in each case, it is necessary to examine the conception of the cosmos which consciously or unconsciously underlies it. In this connection it may be observed that all varieties of pre-Christian and non-Christian cosmopolitanism lack the concrete idea of a divine plan of salvation extending to all mankind; this idea is present in all forms of cosmopolitanism developed within the cultural sphere of Christendom, even though such cosmopolitanism may not have accepted the Christian dogma or may explicitly have disavowed it.

The general psychological disposition for the advent of cosmopolitanism inheres in individualism. Before the solidarity of older and more primitive social groups can pass into a solidarity embracing all mankind, an intermediate or individualistic stage must be traversed, in which the grip of traditional ties is loosened. Once the primacy of the individual over his community becomes exalted into a thesis the way is paved for cosmopolitanism to appear as the principle of a universal rather than particularistic solidarity. Establishing through the symbol of citizenship an immediate union between the individual and mankind, cosmopolitanism manifests itself in this stage of its evolution as an abstract universalism. The latter is to be distinguished from the concrete type of universalism which was common among the romantic philosophers and which finds in intermediate entities—the family, state, race or league of nations—agents of union between the individual and humanity. Where the state as intermediate power is of dominant significance, concrete universalism is usually termed not cosmopolitanism but internationalism. Internationalism by no means implies that indifference to nationality which necessarily characterizes cosmopolitanism as a consequence of its individualistic basis.

The continued development of individualism into cosmopolitanism depends upon the presence of certain sociological conditions. To a large extent these are the same as have already determined the rise of individualism: deracination from the native soil, loss of permanent domicile, migration, urbanization, travel and such intercourse with foreign peoples and races as may result from military expeditions, com-

mercial relations, congresses of scientists and artists, relations with kindred in other lands and the knowledge of foreign tongues. Any influence, external or internal, which operates independently of the individual's choice to dissolve the organic bonds between him and his native group and to undermine his feeling of solidarity may create the *a priori* conditions for cosmopolitanism, inasmuch as cosmopolitanism itself provides an escape from specific social authority. That is, by standing, or aiming to stand, in immediate communion with all men, an individual easily avoids the risks and sacrifices which in view of the perpetual conflicts between all particularistic groups beset a social life based on narrower solidarities. The profession of cosmopolitanism may, it is true, bring with it new decisions and trials, for instance in time of war or in a conservative environment. But on the whole the actual obligations which cosmopolitanism lays upon its adherents are comparatively negligible—the more so because in practise it seldom goes beyond demonstration, sentimentality, propaganda and sectarian fanaticism. Hence it often exists among persons whom fortune has relieved from the immediate struggle for existence and from pressing social responsibility and who can afford to indulge their fads and enthusiasms.

The form which cosmopolitanism assumes is in general conditioned by the particular social entity or group ideal from which it represents a reaction. In antiquity the dominant social entity was usually the *polis*, in the Roman Empire the province, in the Enlightenment the religious faith, class and state; at present it is mainly the state, nation and race. The cosmopolitanism of international finance and of export trade develops as a protest against a merely national economy and begets the conception of world wide economic interdependence. Moreover all business magnates, in order to escape the strictures with which narrow solidarity binds the passion for gain, have a tendency to embrace cosmopolitanism and to wrest from it an ethical sanction for all their activity. The Marxian doctrine that economic interests take precedence over political and ethical attachments finds its moral basis in the same source. The sportsman and the virtuoso, who in their desire to establish records or to win unique fame roam homelessly from place to place, express a form of cosmopolitanism. The praetorians in late Rome represented a military cosmopolitanism analogous to the indifference

to nationality characteristic of the mercenary soldiers of early modern times and of the military adventurers who are to be found today in the foreign legions or wandering from service to service. In the prevalent conceptions of the internationalism of science and of art, other types of cosmopolitanism are implicit. In all these cases it is apparent that cosmopolitanism takes form as a cosmic principle through an essentially uncritical generalization from the vocational ethic and that its guise of universality conceals either an unconscious recognition of the particularistic solidarity or even a very one-sided individual interest. If, therefore, in time of crisis or upheaval, such as might be occasioned by war, revolution or personal strife, an imperative appeal is made to the traditional social impulses which have been crowded into the background by cosmopolitanism, the latter may suddenly lapse into its extreme antithesis, a fanatical devotion to a narrow allegiance. Even while his basic individualism remains untouched by such fluctuations of solidarity consciousness, the former cosmopolitan may, in these circumstances, become an impassioned spokesman of chauvinism, class hatred or confessionism.

When the corporate spirit engendered by the individual's organic relationship to his traditional group is transferred to whatever sphere he visualizes as a cosmos, it tends to become dissipated in the subtleties of symbolism or in loudly voiced but tenuous analogy. This is equally true of Greek cosmopolitanism, where the symbol of citizenship was carried over from the *polis* to the world at large, and of the vague attempts of deism in the Enlightenment to replace Christianity with its firm social organization by a more comprehensive faith. Frequently the consciousness of membership in an élite group or some merely personal associations with people abroad mold the individual's conception of the cosmos. Thus the distinguished scholar who ordinarily comes into touch with foreign colleagues as exchange professor, member of an international society or participant in a congress is transformed into a *magister mundi*, and from the elements of cosmopolitanism so created may make illogical generalizations in the sphere of politics. In the case of international orders like the rotary club and freemasonry, the basis for a cosmopolitan attitude is provided by a definite sociological medium, which appears to its constituents as *pars pro toto*. The Catholic hierarchy and religious

orders exercise a similar influence upon their members. Such cosmopolitanism is, to be sure, only intermediate; but because its adherents are equipped with a sociological apparatus and form an organic part of an actual, rather than merely symbolic, international relationship, they may develop a notable cosmopolitan tradition.

Cosmopolitanism which has become integrated into a doctrine and which envisages a more or less positive polity of mankind may be either static or dynamic. The former starts with the assumption that human solidarity can and must be accomplished without delay and in all regions of the globe; whereas the latter views it as the end goal of a gradual evolution toward world betterment. As a doctrine cosmopolitanism is allied with pacifism and with the conception of human equality, an equality which may be considered natural and real or abstract and hypothetical. In appreciable degree the propagation of cosmopolitanism depends upon the extent to which these allied doctrines are accepted. It therefore comes into conflict with all world views which presuppose an intrinsic inequality among peoples and races and justify with this premise the domination of an "inferior" by a "superior" political or ethnical group. Imperialism, which from one point of view facilitates the development of cosmopolitanism since it creates new and varied networks of intercourse, is fundamentally at odds with cosmopolitanism when racial and group privileges form the basis of colonial domination. Modern internationalism, on the other hand, allows the individual to identify himself with a definite sociological cosmos by means of its concrete forms of international organization.

Even as an idea complete cosmopolitanism exists only in doctrinal form. The ambivalence obvious in the case of persons whose cosmopolitanism is associated with freemasonry, Catholicism or high finance, and even more obvious among the higher nobility, whose international sympathies aroused by family ties in other lands are offset by caste exclusiveness, is present in some degree in all adherents of cosmopolitanism. In the mind of any individual the concept of cosmopolitanism represents only one extreme in a bipolar system, not merely because it takes form as a reaction against a particularistic social entity, but because the psychic power of manifold narrower solidarities persists and cannot be effaced. Although these opposing drives vary in nature and strength according to time, environment and individual they are

the components of an inevitable parallelogram of forces. In consequence cosmopolitanism as a mental attitude always manifests itself in the form of a compromise with nationalism, race consciousness, professional interests, caste feeling, family pride and even with egotism.

The history of cosmopolitanism is embedded, as has been said, in western culture and began in Greece. While Cicero may have been incorrect in tracing the origins of cosmopolitanism to Socrates, it is expressly recorded that Socrates' pupil Antisthenes (c. 450-366 B.C.) employed the term. Alexander the Great's infusion of the cultural and political ideals of the *polis* into the oriental conception of universal empire provided cosmopolitanism with the environment it needed for development and the Hellenistic period became rife with cosmopolitan tendencies and theories. The tradition begun by Antisthenes and his fellow cynic Diogenes and by Aristippus of the Cyrenaics was taken over by certain of the Epicureans, Theodoros and Diogenes of Oenoanda, and reached its efflorescence among the stoics, beginning with Zeno. Along with the rest of Hellenistic culture the theory of cosmopolitanism thus developed passed to Rome, where it was continued by the later stoics Cicero, Seneca, Epictetus and Marcus Aurelius. Throughout the entire span of the Hellenistic-Roman period it suffered no essential change. The concept of the *cosmos* continued to be a reaction against constant conditioning forces—nationally conceived polytheism and local patriotism. Favored by political and social conditions, receiving first from Hellenistic and then from Roman imperialism scope for development and protection from the disquieting influence of great political conflicts, cosmopolitanism was enabled to become a sentiment uniting cultured minds. For the rest, it had arrayed against it, just as it had in the modern Enlightenment, particularistic political and military forces strong enough to prevent it from seriously crippling the historical energies operative at the time.

From early Christianity with its claim to universality and its insistence upon social equalitarianism, cosmopolitanism seems to have received a strong impetus. Judaism, likewise, from now on became an important carrier of cosmopolitanism. But whatever the universalistic implications of its metaphysical postulates, for example the doctrine that all men are equal before one God, the Christian church, as it grew into an institution and exhibited itself as

a historical force, developed strong anticosmopolitan tendencies. Thus the schism between western and eastern Catholicism, the division into churches and sects, the confessional antagonisms to the heathen, Jew and Mohammedan, and the gradual stratification into a hierarchy of officials, all operated to stimulate a merely particularistic solidarity. The separatistic trend was augmented by the downfall of the Roman Empire and the transformation of Europe into a mosaic of German-Romanic states. In the so-called universalism of the Middle Ages, there are of course certain elements suggestive of cosmopolitanism, the clearest instances being the theocratic universalism of Augustine, Dante's conception of world empire and, during the period of transition to modern times, Campanella's utopianism. Moreover, the persistence of cosmopolitanism as a mental attitude of single groups and classes was insured by religious orders, the knightly orders of the crusades, the universities and the journeyings of artisans and artists. But because the necessary psychological basis, individualism, was lacking, the Middle Ages never developed a real cosmopolitanism.

This basis was provided by the Renaissance. The Enlightenment, continuing the traditions of the Renaissance, reabsorbed stoic philosophy into western culture and in this way cosmopolitanism entered into a new epoch of significance. Princes, diplomats, poets, scholars and other intellectuals became its spokesmen. The barriers which in the religious wars of the seventeenth century had seemed indestructible disappeared in the eighteenth before the onslaught of deism, pantheism and rationalism. From secular orders and secret societies cosmopolitanism received both a dogma in the form of an ideal of humanity and a social ritual. While cabinets continued to wage war, intellectuals posted up constructive theories of peace and the foremost of the pacifists, Kant, called cosmopolitanism a "regulative principle." Then came the rise of nineteenth and twentieth century nationalism, a force so compelling and pervasive that it swept even the intellectuals before it. The change, marked by the Napoleonic wars and the development of romanticism, became cemented as with the rise of democracy a close bond was forged between nationality and state, both of which, starting from the precise individualistic premise which the Enlightenment had given them, exercised a notable influence in the direction of a strong particularistic solidarity. Thereafter cosmopoli-

tanism lost its hold upon the educated classes and the nobility and to a certain extent also upon the clergy. But it made corresponding headway among the Marxists, who have exalted it into an equalitarian program, and among the representatives of large financial interests, who, however, often conceal it beneath authoritarian and nationalistic pretenses. Before and since the World War cosmopolitanism has also found an outlet in the efforts to organize the newly awakened spirit of internationalism. As a basic psychological factor it has been of undoubted importance in whatever success has been attained by the Hague conferences, courts of arbitration, the League of Nations and the World Court.

The absolute denial of those distinctions between races and peoples and of the traditional class divisions which form the basis of imperialism and of social organization during the period of full capitalism has been the contribution to cosmopolitanism made by Bolshevism. Through the universal leveling of civilizations to which the World War has given such tremendous impetus and through the ever increasing networks of communication among the peoples of the whole earth, all sections of humanity have gradually been brought face to face with the problems of cosmopolitanism, irrespective of their historical detachment from its development in western civilization.

Modern social biology and in particular the doctrine of cultural stages suggests that cosmopolitanism is to be conceived as belonging typically to the closing periods in the lives of civilizations. While as yet sociology remains skeptical of comparisons between western cosmopolitanism and analogous phenomena evolved in other historical periods, it will not be able permanently to ignore the parallelisms offered by the pre-Grecian Asiatic culture which influenced Hellenism; by the civilization of the Near East, which may very well have contributed certain elements to the recent irruption of cosmopolitanism in that region following upon its westernization; and perhaps by America prior to its colonization by Europeans. Only thus can a complete analysis of cosmopolitanism be made.

COSSA, EMILIO (1863-1908), Italian economist. Cossa was educated in economics by his eminent father, Luigi Cossa, and published a

long series of works on varied subjects. He began his career with a pamphlet, *Concetto e forme della impresa industriale* (Milan 1888), in which he discusses the productive efficiency of various forms of enterprise and attempts to determine the limits of their extension. Two years later he began a series of works which appeared with almost mechanical regularity: *Primi elementi di economia agraria* (Milan 1890), in which the technical-agricultural principles are distinctly separated from the economic; *I fenomeni della finanza pubblica e i loro rapporti con l'economia sociale* (Milan 1892), in which he presents marked advances analogous to the theory of Sax on financial phenomena; *Il metodo degli economisti classici* (Bologna 1895), which was intended to demonstrate that in spite of the prevalence of the deductive method the classical economists were able at times to make use of the inductive method also; *Il principio di popolazione di Tomaso Roberto Malthus* (Bologna 1895); *Del consumo delle ricchezze* (2 vols., Bologna 1898), a critical and explanatory monograph on the subject of consumption, which had usually been fragmentarily treated or neglected; *Principii elementari per la teoria dell'interesse* (Milan 1900), in a sense borrowed from the doctrine of Böhm-Bawerk; an important study of trusts, *I sindacati industriali* (Milan 1901); the much more noteworthy although too optimistic work, *Conflitti e alleanze di capitale e lavoro* (Milan 1903); and *La teoria dell'imposta* (Milan 1902), a general study on the origin of taxes and the historical development of tax systems. Among his minor works are "L'inesistenza di plus-valore nel lavoro e la fonte del profitto" (in *Giornale degli economisti*, 2nd ser., vol. xxxiv, 1907, p. 48-61); *Il pensiero di Adamo Smith nella teoria quantitativa del lavoro* (Messina 1907); *L'interpretazione scientifica del mercantilismo* (Messina 1907); "Il mercantilismo e l'economia politica" (in *Giornale degli economisti*, 2nd ser., vol. xxxvi, 1908, p. 323-52).

All these works reveal great power of objectivity, broad and profound knowledge of international literature and clarity of analysis. They assisted in the diffusion of economic knowledge and in securing an evaluation of the truth contained in contradictory opinions.

AUGUSTO GRAZIANI

COSSA, LUIGI (1831-96), Italian economist. Cossa studied first at the University of Pavia, then at Vienna under Lorenz von Stein and at Leipsic under Wilhelm von Roscher. From 1858

until his death he was professor of political economy at the University of Pavia. The influence of his German training is reflected in his bibliographical and historical studies, especially the *Guida allo studio dell'economia politica* (Milan 1876, 3rd ed. with title *Introduzione . . . dell'economia politica*, 1892; tr. by L. Dyer, London 1893). The book, divided into a systematic and a historical part, is the fruit of an exact and critical investigation of the sources and is most useful for the orientation of the student in the vast literature of the social sciences. His works are highly didactic, rich in suggestions and outlines for more detailed investigations. In the *Saggi di economia politica* (Milan 1878) the essays concerning capital, industrial enterprise and the limits of production are particularly noteworthy and still valuable. *Primi elementi di economia politica* (Milan 1875), which ran through many editions and translations, is precise in thought and elegant in diction. Some practical applications are also discussed in the *Primi elementi di scienza delle finanze* (Milan 1876, 12th ed. 1923; English translation New York 1888), which presents under an appearance of elementary treatment profound generalizations valuable for the advanced student as well as for the beginner.

Under Cossa's influence Pavia became the center of the study of economics in Italy. He founded no school of his own in the strict sense of the word, for he was hospitable to every doctrinal tendency. He aided his students generously and stimulated them to valuable work in theoretical and historical economics and in finance and statistics. In his *Introduzione* he was able to avail himself of monographs by his pupils on various phases in the history of Italian economic theory. He transmitted to his students an interest in the economic thought of other countries, especially Germany and England. The university chairs were for the most part filled by his students and by their students in turn. Cossa did more than anyone else in Italy during the last thirty years of the nineteenth century to promote the revival of the scientific study of economics.

COSSACKS. The term Cossack is of Tartar origin. Mention is frequently found in fifteenth century sources of Tartar Cossacks, lightly armed horsemen who sometimes banded into companies and engaged in military operations on their own authority. In the same century Cossacks appeared as a separate Russian group. At that time territories settled by Russians and forming a part of Russia and of the Polish-Lithuanian state were bounded on the south and southeast by a wild unsettled steppe, beyond which was the territory of the Tartars. Neither of these states commanded sufficient armed forces to protect its borders adequately, so that the population of the frontier provinces was in large measure left to its own resources in coping with the frequent and devastating raids carried out by the Tartar horsemen. This led to the formation of bands of volunteers, who were always prepared to repulse the Tartars and who adopted from the latter the name of Cossacks as well as the tactics of brigand raids. Beginning with the close of the fifteenth century the steppe, teeming with game and abounding in natural resources, became increasingly attractive to these Cossack groups, which made frequent and ever more extensive expeditions for the purpose of hunting and fishing. When they returned home or settled in the northern sections of the steppe they retained the type of organization developed during these expeditions, scarcely recognized the authority of the government and endeavored to remain free or, as the Polish records state, "disobedient."

Both Russia and Poland soon realized how useful the Cossacks might prove for border defense. In the sixteenth century the Moscow government began to organize in its southern provinces a special group of so-called Settlement Cossacks, whom it attached to frontier forts and to whom it granted some land and paid salaries in consideration of their services as a frontier guard. Similar measures were taken by the Polish-Lithuanian government, which made several unsuccessful attempts to form special Cossack companies for border defense and to subordinate the rest of the Cossacks to the local administrators.

Along with the comparatively small number of Cossacks in government service there appeared in the sixteenth and seventeenth centuries considerably stronger organizations of free Cossacks. Their growth was helped in no small degree by the gradual change in the status of the lower classes which was at this time

taking place in both Russia and Poland. In Russia the enormous increase of the tax burden imposed upon the lower classes consequent upon growing governmental centralization and the rapid sinking of the free peasantry to a servile status forced the more energetic individuals to leave their old homes and join the ranks of the free Cossacks. In Poland a situation equally unfavorable to the lower classes resulted from the concentration of political power in the hands of the landed nobility, who established serfdom in its most oppressive form. In the Russian provinces of Poland attempts to suppress the Russian nationality and persecution of the communicants of the Greek Orthodox church by the government and the fanatically Catholic Polish nobility made conditions even worse and forced increasing numbers to move south and live as Cossacks. By the second half of the sixteenth century there existed on the river Don and its tributaries a Cossack community consisting largely of immigrants from Russia. At the same time the Ukrainian Cossacks who were settled along the shores of the Dnieper sent their advance groups far into the steppe to form a similar community known as Zaporozhskaya Siech (the camp beyond the rapids on the Dnieper).

The Cossack communities were virtually independent of the states whose sovereignty they formally acknowledged. Their political and social organization, in direct contrast to that which prevailed in these states, was based on principles of absolute equality and unlimited self-government. The supreme authority was lodged in the assembly of all Cossacks (*rada* in the Siech and *krug* on the Don), which legislated, passed on questions of war and peace, sat as a court in major crimes and elected the *ataman*, combining the authority of a military leader and a civil administrator, as well as his assistant and secretary. These functionaries were elected for a limited term and were subject to removal at any time by the decision of the assembly; while their authority was dictatorial during a military campaign, they were accountable to the assembly upon their return. The Cossacks made their living from hunting, fishing and the breeding of cattle; hunting and pasture grounds were held in communal ownership. In their military operations against the neighboring Moslem states the Cossacks were also virtually independent. With an increase in their number they were no longer satisfied merely to repulse Tartar raids or to send expeditions to

the Crimea. Venturing in their boats into the Black and Asov seas they began to raid the shore settlements belonging to Turkey. The Russian and Polish governments, which feared a war with Turkey, ordered that these raids be stopped, but such orders were generally disregarded and sometimes aroused the open hostility of the Cossacks. Eventually an open struggle could not be avoided between these governments and the Cossacks, who practised a primitive democratic egalitarianism and harbored in their midst refugees from the political and social oppression of Russia and Poland. Its outcome was different in Poland and Russia.

The Ukrainian Cossacks, who settled along the middle course of the Dnieper and colonized the steppe to the east, were from the end of the sixteenth century under constant pressure from Poland. The latter country, while unwilling to destroy the settlements essential for border defense, endeavored to subordinate the Cossacks entirely to its authority and to limit their number to a definite authorized figure in order to prevent runaway serfs from settling as Cossacks. The Cossacks bitterly opposed such measures. In the first half of the seventeenth century there occurred in the Ukraine frequent and increasingly ominous Cossack uprisings energetically supported by the peasantry, who were fearful of the increasing degree of servitude. Although these revolts were drastically suppressed, the government could not achieve complete pacification of the Cossacks, who had a practically inaccessible stronghold, the Zaporozhskaya Siech, situated far out in the steppe on the islands in the Dnieper. It was a refuge for the remnants of the insurgents and the center for the organization of new rebellions. In this struggle the Cossacks gradually became the rallying point for the victims not only of social oppression but also of nationalist and religious persecution. The struggle came to an end in the middle of the seventeenth century when the Cossacks, realizing the hopelessness of a single handed struggle with Poland, declared their allegiance to Moscow during an insurrection led by Bogdan Khmelnitsky. Russia was thus able to claim the Ukraine as its possession and after a protracted war with Poland succeeded in retaining the territories on the left shore of the Dnieper and the region of Kiev. In the provinces on the right shore of the river, which remained under Polish rule until the end of the eighteenth century, the Cossacks attempted for some time to retain their

autonomy by pledging their allegiance now to Poland and now to Turkey. By the beginning of the eighteenth century, however, the Cossacks had merged with the peasantry and separate Cossack communities had disappeared.

The Cossacks on the left shore of the Dnieper received under the terms agreed upon by Russia a large measure of self-government. The authorized number of Cossacks was greatly increased: it was 60,000 when Russia claimed the whole of the Ukraine and 40,000 when Russia kept only the territories east of the Dnieper. All the lands preempted by the Cossacks were recognized as the property of their community. They were exempt from taxation and were merely under obligation of military service. They were governed by their own laws and customs administered by elected functionaries with an elective *hetman* at the head. In practice these Cossack authorities assumed the general administration of the annexed territory. At first there was no sharp distinction between the Cossacks and other social groups in the Ukraine: peasants and the petty urban bourgeoisie freely claimed the status of Cossacks and vice versa. Gradually, however, a process of differentiation set in, which was aided by the central government. The upper stratum of the Cossacks, which supplied candidates for elective offices and accumulated large private holdings of land granted by the government as reward for its services, came in the course of time to resemble the Russian landed gentry and toward the end of the eighteenth century was given the same civil status by the government of Catherine II. Even before that the office of *hetman* was abolished and the other high functionaries were made appointive rather than elective. At the same time the rank and file of the Cossacks were more stringently separated from the burghers and peasantry and service in the Cossack troops was regulated in greater detail by the central authorities. With the establishment of a standing army early in the eighteenth century and still more with the extension by the end of the century of the Russian frontier to the Black Sea the Cossack troops lost all of their former importance. In 1783 Catherine II disbanded the Ukrainian Cossack regiments. Although they retained personal freedom the Ukrainian Cossacks constituted thereafter merely a special category of state peasants.

The history of the Cossacks in the easternmost province of the Ukraine, which later formed the province of Kharkov, was much the

same. These settlements were established by the Cossacks who fled from Poland at the time of the Khmel'nitsky insurrection. The Moscow government gave them lands and formed them into five regiments, which were governed by elected officials under the control of the central government rather than of the *hetman*. In the course of time self-government was curtailed and the status of the Cossack functionaries approached that of the Russian gentry, until by the end of the eighteenth century all differences had disappeared. The substitution at the same time of civil government for the military organization destroyed the distinction between the rank and file of the Cossacks and the general population.

The Cossacks in Zaporozhskaya Siech were always more independent than their brethren to the north. They were more daring and adventurous spirits, who forsook the pleasures of settled family life and formed a community resembling somewhat a military order; it developed an esprit de corps which enforced a most rigid discipline in time of war but brooked no authoritarian interference in time of peace. After the Russian annexation of the Ukraine these Cossacks displayed considerable independence in their relations with the Moscow government, openly resisting its plans for centralization; and in the disturbances subsequent to the death of Khmel'nitsky they invariably lent their support to the more democratic elements of the population. In 1709, when Charles I of Sweden invaded the Ukraine and the Cossack *hetman* Mazeppa joined the Swedes against Russia, the Cossacks of the Siech followed Mazeppa. The Siech was destroyed by the victorious Russian troops and the surviving Cossacks fled to Turkey. In 1733 they were permitted to return and rebuild the Siech, but the government continued to regard them with suspicion intensified by the continuous conflicts of the Cossacks with the Polish authorities and the Russian settlers in the region. After the decisive Russian victory in the Crimea the government lost its interest in the Cossacks, and in 1775 the Siech was occupied by Russian troops. Most of the Cossacks fled to Turkey, where they founded a new community, the Transdanubian Siech. Those remaining were reorganized in 1783 into a new Cossack military division, which was after 1792 settled in the Kuban valley in order to protect the frontier against the Caucasian mountaineers.

The history of the Don Cossacks down to

the eighteenth century is similar to that of their Ukrainian brethren. In addition to hunting and fishing, plunder of the neighboring Moslem communities and occasionally of Russian merchant caravans was at first an accepted way of earning a livelihood. Cossack detachments would also offer themselves for hire to convoy trading expeditions. One of such detachments, led by Ernak and equipped by a great merchant house, the Stroganovs, penetrated at the end of the sixteenth century into Siberia, claimed it for Russia and established the first settlement of Siberian Cossacks. Early in the seventeenth century the Cossacks from the Don as well as from the Siech and the Yaik (a settlement of a group of Don Cossacks) were active in supporting various self-styled pretenders to the Russian throne in the stormy years that followed the extinction of the Kalita dynasty. Subsequently they aided in driving the Polish forces out of Moscow and in bringing about the enthronement of Mikhail Romanov. Although officially in the service of the Moscow government, which paid them a salary in bread and munitions, the Cossacks displayed open hostility to its centralistic tendencies. In the reign of Mikhail's successor, Alevey, the poorer Cossacks under the leadership of Stepan Razin organized a rebellion which spread to a number of cities on the Volga, where a Cossack form of self-government was set up by the rebels. Razin was defeated after a protracted struggle and was delivered to the Russian government by the Cossack authorities, which remained loyal. Early in the eighteenth century, when Peter I disregarded the traditional Cossack liberties in ordering them to surrender the serfs and religious dissenters who sought refuge in their territory, the Cossacks refused to comply and in 1707 attacked and destroyed the troops sent to enforce the order. The insurrection under Kondraty Bulavin which followed was mercilessly suppressed. Some of the insurgents fled eventually to Turkey, where they remained for a time in the service of the sultan as a separate military unit. After the rebellion the government, relying upon the support of the more prosperous Cossack aristocracy, made the office of the *ataman* appointive rather than elective and later extended the principle of appointment to other high offices. This caused another important revolt in 1773, which was initiated among the Don Cossacks settled on the river Yaik by Emelyan Pugachov, who declared that he was Emperor Peter III, or

liberate the common people from the oppression of the nobility. The uprising, which was aided by the Mongol settlers in the Ural region and by a considerable portion of the peasant serfs, lasted for several years and caused the government considerable trouble before it was suppressed. The privileges of the Yaik Cossacks were subsequently further curtailed and their very name was changed.

By the beginning of the nineteenth century the incorporation of the remaining Cossacks in the general administrative and social structure of Russia was complete. In the course of the following hundred years several new Cossack troops were organized and stationed on the southern and southeastern frontiers, so that at the close of the century there were eleven Cossack units, which comprised a population of about two and a half million people, including the members of the Cossack families. The home territory of each of these Cossack units was governed by a Cossack administration which was in the main an appointive bureaucracy, the democratic principle having been retained only on the lower levels of the administrative machinery. The population of these territories consisted roughly of three distinct groups. Of these the Cossack rank and file were entitled to a land allotment of thirty *desiatin* (eighty-one acres) per household, a provision which was considerably in excess of the customary norms for peasants in European Russia. In return the male Cossacks were liable to eighteen years of military service and were obliged to provide their own mounts and their own munitions with the exception of firearms. The Cossack aristocracy was composed of the families of officers and officials, who were granted full property rights in extensive landed estates and resembled the landed gentry of other parts of Russia. Finally there were the "outsiders," the settlers not related to the Cossacks and excluded from participation in Cossack communal and social life, who constituted by the end of the century over a half of the population in Cossack territories.

The Cossack troops were in the main a lightly armed cavalry, the significance of which as a fighting force declined with the modernization of warfare after the middle of the nineteenth century. They were of greater importance for internal police duty, in which the government relied upon the fostered aloofness of the Cossacks from the rest of the population. With the development of the revolutionary movement in

the last quarter of the nineteenth and early in the twentieth century Cossack troops were used to suppress active manifestations of labor and peasant unrest. The loyalty of the Cossacks was exploited on a large scale during the revolution of 1905, but they refused to be pressed into a similar role in March, 1917. The Bolshevik revolution of October, 1917, however, met with strong opposition from the Cossacks; in the Cossack territories the Soviets were for a considerable time regarded as agencies for establishing the rule of the "outside" population. In the civil war period the White forces found their staunchest supporters among the Cossacks, although the lines of cleavage characteristic of the rest of Russia could be traced also within the Cossack communities. With the victory of the Soviet rule the government altered the civil status of the Cossacks in the direction of merging them with the general population but was careful not to interfere with the cultural peculiarities of Cossack life.

The foreign scientific literature on the Cossacks is extremely meager. Among recent items see Czapliska, M. A., "The Evolution of the Cossack Communities" in *Journal of the Central Asian Society*, vol. v (1918) 42-56, containing a bibliography; Korduba, M., "Die Anfänge des ukrainischen Kosakentums" in *Zeitschrift für osteuropäische Geschichte*, vol. ii (1912) 367-81, a review of Hrushevsky's work cited above.

COST, in economics, means the surrender or destruction of value or the performance of some irksome activity as a means to the production of commodities or the acquisition of income. In a voluntaristic capitalist society the cost to an individual who contributes in any way to the processes of production may consist of an expenditure of money, of goods for which money could be obtained, of manual or mental effort irksome at the margin; or it may involve the assumption of a physical or financial risk, the

acceptance of a role carrying with it social disesteem, the choice of the less attractive of alternative ways of employing time or resources, although none of the alternatives need be of itself displeasing or irksome.

Maximization of the excess of income over cost is the fundamental economic principle, the essence of rational management of the economic activities of an individual or a community. To the extent that men act in accordance with this principle they choose of two or more alternative methods of obtaining a given objective that involving the smallest cost, they carry their cost activity to the point where marginal cost equals the resulting marginal income, and they apportion their productive resources among the available alternative uses in such a way that each type of resource obtains an equal marginal return in each of its uses. Cost of production thus plays a vital role in the allocation of productive resources among the different industries, in the selection among the various alternatives of the types of production processes to be employed and in the determination of the geographical location of industry.

The interest of economic theorists in cost has until recent years been largely confined to the relationship of cost of production to competitive price. In the writings of the preclassical economists there was little systematic discussion of cost, and even those of the classical school were confused and in disagreement among themselves on some of the most fundamental aspects of the relation of cost to price. However, even before Adam Smith some writers insisted that cost of production could influence price only if and as it influenced output and therefore supply (see particularly *Considerations Relating to the Laying Any Additional Duty on Sugar from the British Plantations . . .*, London 1747). Some of the classical economists distinguished between market or short run prices, on the one hand, and natural or long run prices, on the other, on the ground that the former were determined by demand and supply and the latter by cost of production. Malthus and Senior first emphasized the indirect nature of the influence of cost on price, but it was not until much later that it was clearly brought out, especially by Marshall, that if the influence of cost on price was more important in the long run than in the short run it was because it took time to adjust supply to changed conditions and that except through its influence on such adjustment cost could not affect price. The suggestion made by some

writers that it is cost of reproduction rather than cost of production which determines price was also intended to emphasize the indirect nature of the relationship between cost and price. Since past costs, they argued, could not influence subsequent production they could not therefore influence price.

The classical school presented three rival explanations of the relation of cost to price. These explanations were in terms of psychological or pain costs, of labor day costs and of money costs, or "expenses of production." The psychological and the labor day cost explanations, however, were supported by the same writers and were not often clearly distinguished from each other. The pain cost theorists claimed that the prices of competitive commodities must in the long run be proportional to their psychological costs of production, for otherwise the factors of production involving painful effort would be transferred from the employments in which they were comparatively poorly remunerated to those in which they were better remunerated. The most rigid form of pain cost theory was the famous labor cost theory of value, usually presented in terms of the proportionality of value to cost in labor days but generally with a clear implication that labor days were to be interpreted as representing equal units of irksomeness. Germs of the labor cost theory are to be found in Locke, Petty and other early writers. Adam Smith accepted it for the "rudimentary state," but for advanced society he held that the existence of rent and interest destroyed the relationship of proportionality and that money expenses of production, including wages, interest and rent, regulated value. He accepted "labor command," or purchasing power in terms of labor, as the best measure of the value of a commodity to society at different periods of time. Ricardo in his *Principles of Political Economy and Taxation* (London 1817) presented a rigid labor cost theory of value of reproducible goods, but only as a first approximation which he qualified in several important particulars. In the first edition he conceded that commodities into whose production labor and capital entered in different proportions would not have values proportional to their labor costs alone. Later he made the additional concession that the relative prices of such commodities would change if the wage rate or the interest rate changed, even if their relative labor costs remained unaltered.

As early as 1774 Lord Kames criticized the

failure of the labor cost theory of value to allow for differences in wages in different occupations and in costs of materials. Adam Smith argued that differences of wages between occupations reflected differences in their agreeableness or disagreeableness, so that he would presumably have accepted wages costs as proportional to labor pain costs even if not to labor day costs. Ricardo did not attempt seriously to meet this difficulty in so far as relative costs at any one moment of time are concerned. He claimed, however, that the relative scale of wages in different occupations remained constant for long periods, so that changes in prices of different commodities relative to each other could not be due to differences of wages in different occupations. James Mill adhered to the labor cost theory more strictly than Ricardo, disposing of rent as a differential return as did Ricardo and converting capital costs into labor costs on the ground that payment for capital was payment for the old labor which had made the capital. Nevertheless, he inconsistently followed Ricardo in conceding that a change in the general rate of wages will change relative prices even though relative labor costs remain unaltered. McCulloch appears to be the only other economist of note who accepted the labor cost theory of value without serious qualifications. Germain Garnier, Poulett Scrope and Senior found a basis for interpreting capital costs as pain costs by introducing the concept of abstinence as the pain cost of saving, and Senior presented a pain cost theory of value in terms of labor cost and abstinence cost combined, although with qualifications for the additional influence on price of relative natural scarcities of commodities and without clear explanation of how labor costs and abstinence costs could be equated to each other. Cairnes followed Senior in arguing that relative prices are determined by labor and abstinence in terms of pain cost, but only where free competition prevailed among sellers of commodities and among seekers for employment. For the products of non-competing groups within a country, as for the products of different regions between which there was imperfect mobility of the factors of production, relative values were determined by relative pain costs only within the groups or regions.

The exponents of real cost or pain cost theories did not deny the validity of the money costs of production explanation, but argued that one could explain money costs in terms of more fundamental factor—Malthus, J. B. Say and

J. S. Mill followed Adam Smith rather than Ricardo in accepting a money cost of production theory of value as adequate and in rejecting the pain cost theory. Marshall and his followers have taken an intermediate position. Denying the proportionality of prices to pain costs and stressing the incomparability of labor pain and abstinence costs and of the pain costs of different individuals, they insist nevertheless upon the justifiability of going beyond the money cost explanation, and tracing the way in which pain costs by influencing the supplies of the factors influence their rates of remuneration and therefore the relative money costs of production of different commodities. Each laborer tends to work and each capitalist to save until the marginal disutility to him of the labor or the saving equals the marginal utility to him of the price paid for it. Disutility or pain cost curves of individuals thus determine the amounts of labor and of waiting which shall be available at each possible rate of wages or interest and are therefore a factor in determining what shall be the actual market rates of wages and interest.

The classical economists conceded that utility was a necessary condition for the existence of value, but they either tacitly assumed that utility remained constant and attributed changes in value solely to changes in cost or, assuming cost per unit to be constant regardless of output, they argued that in the long run changes in demand could not result in changes in price if cost of production remained unaltered. Jevons, the Austrians and J. B. Clark shifted the emphasis in value theory to the demand side and maintained that utility was the ultimate regulator of value. The prices of the production factors are merely a reflection of the prices of their products, each factor commanding a rate of remuneration per unit corresponding to its marginal value productivity; and the total amount available of each factor is tacitly assumed to be fixed and independent of its rate of remuneration. While the prices of commodities are proportional to their money costs of production, these money costs are themselves wholly dependent on the demands for the products of the factors.

The opportunity cost doctrine, first given that name by David I. Green ("Pain-Cost and Opportunity-Cost" in *Quarterly Journal of Economics*, vol. viii, 1893 94, p. 218-29) and developed with some elaboration by Davenport (*Value and Distribution*, Chicago 1908, ch. vii), is essentially a variant of the Austrian theory of

cost. According to the opportunity cost doctrine the cost of producing any commodity A is the amount of commodity B which might otherwise have been produced with the same expenditure of resources; or, stated somewhat differently, the cost to be assigned to the use for specific purposes of any factors of production is what is foregone by their not being applied to their best alternative use. The concept is of some service as a working basis for assigning costs to the use of the personal services and capital of the entrepreneur; but unless the alternative incomes or commodities are the products of absolutely homogeneous factors working in identical combinations, the opportunity cost doctrine becomes simply another mode of expounding the ordinary money cost of production doctrine or breaks down.

Modern discussions of cost of production rest on certain fundamental theorems with respect to the variations in the physical output as the factors are combined in different proportions and as the sizes of these combinations are varied. The law of diminishing returns, first enunciated for agriculture by Turgot and later in England and Scotland by Anderson, Malthus and West, was claimed eventually to be a universal law operative for all physical factors of production. It asserts that if to one factor held constant in amount there be applied successive doses of other factors, after a certain point ordinarily reached quickly the aggregate output of the combination as a whole will increase, if at all, in smaller ratio than the increase in the varied factors. There will therefore be increasing aggregate returns to the working combination as a whole but at a diminishing rate of increase and diminishing average and marginal returns per unit of the varied factors. The amounts of the respective factors of production necessary for the production of one unit of the product, or in Walras' phrase the "technical coefficients of production," will depend therefore on the way in which the law of diminishing returns operates. The most efficient proportion of the factors is determined, however, not merely by the technological law of diminishing returns but also by the amount of output desired and the prices of the factors. As the output is increased and the size of the combination of factors is enlarged, the proportions in which the factors are combined may either remain fixed or vary so that the optimum proportions for each particular scale under the prevailing prices of the factors are employed. The behavior of money costs of

production per unit as output is increased will depend, therefore, on the behavior of both the technical coefficients of production and the prices of the factors.

In tracing the trends of money costs as output is increased it is convenient, following Marshall, to distinguish between short run and long run periods. The short run period is long enough to permit of variations in output through more or less intensive utilization of the relatively fixed elements of a plant but not long enough to permit of any adjustment in the scale of the plant. The long run period is long enough to permit of adjustment of both the scale of the working combination and the proportions of the factors in any way and to any extent that may be technologically possible. This distinction is obviously too sharp to be realistic, since actual long run adjustments of plant must occur through a succession of short run changes, but the modifications necessary to meet the conditions of reality can readily be supplied when the occasion calls for them, once the limiting cases have been analyzed.

In a productive unit in which some of the factors are for the short run period absolutely fixed in amount and others can be increased or decreased at will, aggregate costs associated with the fixed factors will remain unaffected by any short run change in output. These will here be called overhead costs, although the term is also used with other meanings. An increase in output will raise, however, the aggregate costs associated with variable factors, i.e. the direct or variable costs, in proportion to the increase in the amounts of variable factors employed in the productive combination. As output is increased beyond the point where the law of diminishing returns begins to operate, it will take an increase in the amount of the variable factors of $a + x$ percent to bring about an increase of a percent in output, x being a positive quantity itself increasing as output is increased. With an increase in output variable costs per unit will therefore rise at first slowly and later with increasing rapidity, as is indicated by the curve ADC (see graph on the next page). The overhead costs per unit of output will decline, however, rapidly at first and more slowly later, their curve AFC tracing a rectangular hyperbola. The average cost per unit, including both fixed and variable costs, shown by the curve AC will fall at first owing to the rapid decline in the overhead costs per unit but will turn upward at that point where the increase in the average variable

costs begins to exceed the decrease in the average overhead costs. At this point marginal cost, or the variable cost of the last unit added to output, must obviously be equal to the average cost per unit. For this reason the curve MC representing marginal cost will intersect the curve AC at its lowest point, that is, at the point at which a horizontal line would be tangent to it.

Under short run conditions the preceding description and the graph will represent the characteristics of the cost situation for any concern in any type of industry. There will be differences between concerns and between industries in the rate of change of the various curves and in the relative importance of the downward and upward sloping portions of their average cost curves. The greater the overhead costs, the greater will be the output possible before the turning point N in the average cost curve is

reached. The more marked the operation of the law of diminishing returns, the sharper will be the upward slope of the ADC and MC curves and of the AC curve beyond the point N.

An individual concern achieves equilibrium at the point at which its marginal cost equals its marginal revenue. Since for a small concern in a great competitive industry marginal revenue will approximate price per unit, it will pay the concern to carry production to the point where marginal cost equals price. In the short run equilibrium will be reached when marginal cost equals price, regardless of whether this marginal cost is greater or smaller than average cost. But in the long run marginal and average cost must be equal to each other and to price. Thus if the price is higher than MN, say M_1N_1 , the aggregate returns of the concern on its owned factors will exceed their aggregate cost

by an amount equal to $N_1 R_1 \times OM_1$. Unless this condition is due to the fact that the concern is able to utilize the factors more effectively than can others, which would mean that it is failing to charge at cost the full value of its managerial ability, it will not persist for long. Increased output by the rest of the industry on the one hand, and a rise in the price of the factors on the other, will tend in the long run to eliminate the difference between price and average cost per unit.

Once a long run equilibrium for the industry as a whole has been disturbed by an increase in long run demand and at least a temporary rise in price, a new long run equilibrium will involve an increase in output for the industry as a whole, a change in price and changes in costs. The long run expansion in the industry's output will be brought about by a more intensive use of existing plants; or by an increase in scale of plants; or by an increase in the number of plants, the scale remaining on the average unchanged; or by some combination of these methods. To simplify the exposition it will be assumed that these methods are possible only alternatively, although this is of course an unrealistic assumption.

Increase of output by more intensive utilization of existing plants is by hypothesis the only method of short run adjustment of output to an increase in demand. Since no equilibrium is possible before the point of lowest average costs has been reached, such an expansion involves increasing average costs of production. As a long run procedure it will not be adopted unless other methods of expansion of output either are impossible or involve even higher marginal costs, and when adopted it brings about a situation contemplated by the Ricardian rent theory in its most rigid form. This theory assumes that the land capable of a particular type of use is absolutely limited in quantity and already fully devoted to that use and that there are no advantages in combining farms or in breaking them up into smaller farms. Increase of output can then take place only through the more intensive cultivation of the given quantity of available land and will involve an increase in marginal costs along the curve MC with no difference in this respect from the short run situation. It is a condition, however, of long run equilibrium that marginal cost must equal average cost. This equalization will be brought about for each concern by an increase in land rents or in the prices of the factors limited in quantity.

If the scale of plants does not affect average cost of production and if multiplication of plants affects it adversely, the increase in output will in the long run be provided by a general increase in the scale of the existing plants, each operated at that rate of output which makes its average cost a minimum; production for the industry as a whole will be under conditions of constant average cost as output is increased, and for the individual concern marginal cost will equal average cost. If increase of scale means decrease of average cost, i.e. if there are net internal economies of large scale production, for each concern long run marginal cost will be below long run average cost; each concern will therefore have an incentive to indefinite expansion of its scale of operations, price will tend to fall below average cost, conditions of cut-throat competition and of the progressive elimination of all the financially weaker producers will prevail, and equilibrium will not be established until either the possibilities of internal economies of large scale production have been exhausted or monopoly prevails.

If an increase in the scale of plants involves an increase in average cost of production, expansion of output will take place through multiplication of plants without change in their average size. If the number of plants does not affect costs of production, each concern will in the long run produce at a rate at which its average cost is at a minimum and is equal to its marginal cost, and for the industry as a whole production will be under conditions of constant cost as output is increased. If multiplication of plants results in a general lowering of costs throughout the industry, i.e. if there are net external economies of large production, the industry as a whole will be in long run equilibrium when each concern is carrying production to the point where price, marginal cost and average cost are all equal; but the larger the number of plants, the lower will be the level of costs at which these equalities will prevail, i.e. for the industry as a whole production will be under conditions of decreasing cost. If multiplication of plants involves a general increase in costs, i.e. if there are net external diseconomies of large production, similar conditions will prevail under long run equilibrium except that, as the number of plants and output for the industry increase, the level of costs will rise for all producers and the industry as a whole will operate under conditions of increasing cost.

The factors which account for the decrease in

average cost with the increase in the size of the plants or of the industry have been described by Marshall as internal and external economies. If the prices paid for the factors remain unaltered as output is increased, as has been assumed in the foregoing analysis, such internal and external economies as are present would consist of technological economies, i.e. reductions in the technical coefficients of production. Practically all the examples of possible internal technological economies which are given in the literature result from full utilization of expensive items of equipment or personnel, where either the smallest possible unit requires large output for its complete exploitation or where the efficiency of the unit in the engineering sense increases with its size. It is difficult to conceive of cases of technological external economies. Possible instances, however, are the cross fertilization with respect to ideas and techniques and the general stimulus to technological progress which may result from the existence of many competing producers in the same industry, the advantages of a large labor market in facilitating the selection and maintenance of a satisfactory labor force, and the saving of transportation costs resulting from the even distribution of plants with respect to the market.

Probably more widespread and more important to business men are the pecuniary economies, internal and external. Pecuniary internal economies would be the savings on prices of materials purchased and on rates of remuneration for labor and capital employed which accrue to a large scale concern because of its size. Pecuniary external economies would consist of similar savings accruing to a concern because it was a part of a large industry. Pecuniary external economies for one industry would ordinarily, although not necessarily, be the result of internal technological economies in other industries which supply it with its materials and equipment and which can produce at a lower cost when their outputs are large.

The types of cost trends discussed are static and not historical trends. Through historical time inventions in technology, progressive improvement in business organization and changes in the prices of the factors may result in increasing output being accompanied by falling money costs, even though on a static basis the industry may be one of increasing money costs. For example, the predictions by the classical school of a trend of increasing costs for agriculture were based on the static tendency toward increasing

cost resulting from the operation of the static law of diminishing returns in an industry in which one of the essential factors of production, land, was definitely limited in supply. The progress of agricultural technique, however, has been so great that in spite of the great increase of agricultural output even in old countries during the last century the real costs per unit of output have probably undergone substantial decrease.

In many of the standard economic treatises an attempt is made to deal directly with the relations of the cost trends for an industry as a whole to price instead of proceeding, as was done above, from the cost trends of the individual concerns to the contributions made by each to the supply of the industry as a whole. With respect to industries subject to internal economies of large scale production Marshall saw the difficulty, resulting from the differences in the behavior of the costs of different concerns, in the presentation of a significant cost curve for an industry as a whole. He proposed a solution in the concept of the "representative firm," a sort of modal concern having its appropriate share of the internal and external economies at each stage of growth of the industry at large, so that the trend of its costs would afford an index of the trend of costs for the industry. However, he gave little information on the vital point as to how the representative firm could be identified for each stage of growth of the industry, beyond the intimation that it was a concern earning neither more nor less than the current rate of return on its investment, i.e. a firm whose cost including normal profit was just equal to price. The obvious circularity of reasoning involved in attempting to explain the determination of price in terms of the behavior of costs of a concern which could be identified only by the equality of its cost to price has been pointed out recently by a number of writers and has tended to destroy faith in the usefulness of the concept of the representative firm for this purpose.

American statistical investigations of costs during and since the war have uniformly disclosed a wide range of variation in the average costs of different concerns within each industry investigated. These statistical cost data, when arranged in a graph from left to right in order of increasing size, form an ascending curve; graphs of this type have been called accountants' cost curves, particular expenses curves (Marshall) and bulk line curves (Taussig). Some students of these curves claim that they find a substantial degree of constancy in their statisti-

cal characteristics and especially in their indications as to percentages of output produced at a cost in excess of price. Examination of such curves of this type as have been published does not give much confirmation to such findings, and no *a priori* grounds have been given for expecting such regularities. If the nature of the data on which such curves are based is taken into account, neither the wide dispersion of costs nor the indication that a substantial fraction of output, generally from 5 to 15 percent of the total, is produced at an average cost in excess of price presents any problem of reconciliation with traditional price theory. The curves are based on accounting records differing in their methods of construction from concern to concern, never interpreting costs in exact conformity with the definitions of economists and dealing in an especially arbitrary manner with the important item of interest on investment. The concerns whose costs are recorded are often scattered over a wide area, in which substantial regional differences in transportation costs to market and in market prices may be present. The costs recorded, moreover, are as of an actual production period rather than for any particular period of theoretical short or long run equilibrium. But even equilibrium price theory requires for the short run period only that marginal costs shall be equal for all producers in the same market and leaves room for the existence of wide divergences in average cost and of production at average costs in excess of price.

The preceding discussion of the relation of cost to price assumed the determinateness of unit costs, an assumption which causes some difficulty in the case of joint products. Joint products have been sometimes so defined as to make it difficult to distinguish between the problem of joint costs and that of overhead costs. The most servicable definition designates as joint products commodities which are sufficiently distinguishable from each other to have different markets and to command different prices even under competitive conditions, but which are partly or wholly the outcome of a common process of production. This definition makes the existence of joint products consistent with long run competitive equilibrium, whereas in the long run there are no overhead costs. Under monopoly, however, arbitrary price discriminations between buyers are possible even for homogeneous units of the same commodity and the problem of joint costs merges into that of overhead costs.

Some of the formulae commonly suggested for the apportionment of costs to joint products cannot be defended on grounds either of logic or of expediency. One widely used method of apportionment is to impute as its cost to joint product A the aggregate cost of both joint products minus the market price or the receipts from sale of the other joint product B. This makes the cost of one product depend on the price of another, a price which may often be determined at a moment of time other than that at which the commodity was actually produced. It will give obviously absurd results if the price received from product B should exceed the aggregate cost of both products and is patently unsatisfactory when it is desired to find the separate costs imputable to both products. Equally arbitrary and unsatisfactory are other methods of apportionment sometimes used, which distribute the aggregate costs among the joint products on the basis either of their relative market values or of some physical unit of measurement. Were the nature of the productive process such as to establish fixed and invariable proportions in which the several commodities could be produced, it would be impossible to find any rational basis for apportionment of the aggregate costs or any rational objective which such apportionment could serve. It is always possible, however, to vary in some small degree at least the proportions in which the respective joint products shall be produced. Where these proportions are variable it is possible to find the marginal costs imputable to each by finding in turn what increase in aggregate expenses is necessary to obtain a marginal increment of output of each, the output of the others remaining constant. Such determination of marginal joint costs is essential for rational choice between alternative processes of manufacture where these result in changes in the relative amounts in which the several joint products are produced.

Older economists tended, by implication at least, to minimize the extent or wholly to deny the existence of any discrepancy between costs as reflected in entrepreneurial expenses of production under competitive conditions and costs as burdens on society as a whole. For example, suggestions of this nature are embedded in Adam Smith's theory of the proportionality of wages in different occupations to their agreeableness or disagreeableness, in Ricardo's labor cost theory of value, in Senior's argument that interest was a payment for the disutility of abstinence from immediate consumption and in J. B. Clark's

marginal productivity theory. It later became apparent to most economists, however, that the money costs of production of commodities and services bore no precise or uniform relationship to the subjective costs incurred by those persons directly contributing by their services or capital to their production. A large part of the economic literature which attempts to deal with social cost has consisted of the demonstration that there exist on a priori grounds strong presumptions that entrepreneurs' costs in an individualist economy are an inaccurate measure of the underlying and more fundamental costs of production.

Attempts to devise a satisfactory and usable concept of social cost and to apply it in a positive and objective way to the analysis of economic process have not as yet made much progress. The main source of difficulty lies in the apparent impossibility of finding an objective and homogeneous unit of social cost. A social cost calculus in subjective terms, for instance in terms of disutility, must face the objections that disutility cannot be clearly defined and that it is only in an approximate and unreliable way, if at all, that the disutilities of different persons and periods can be compared. Social cost calculus in terms of consumption of productive resources, or of units of "social energy," requires a scale of relative values on the basis of which units of productive resources of different kinds can be equated with each other, and if their prevailing rates of market value are used for this purpose, the result is simply a money cost of production calculus under a different name.

It is possible to list factors connected with production or with the economic organization of society which will generally be accepted as elements of social cost. Such is essentially the method of J. A. Hobson (*Work and Wealth*, London 1914), who lists as "human costs" such things as the degradation and loss of self-respect of labor which results from menial tasks, the impairment of physical and moral health resulting from the fatigues and strains of industry and the corruption of aesthetic and moral standards—factors which find at best only inadequate expression in the wages cost of labor to the entrepreneur but which society should nevertheless take into consideration. But Hobson fails to disclose by what means these various costs can be objectively equated with each other.

The appraisal of the relative importance of the various social costs as compared with the social income for whose production they may be

necessary involves the use of subjective judgment, even if data upon which it is exercised have been obtained by rigorous scientific investigation. The value of such appraisals for certain purposes is, however, scarcely impaired by the impossibility of objective verification. It is often the only method available to the statesman and the social philosopher when conflicting considerations must be weighed against each other. This still leaves the question open as to whether the social scientist *qua* social scientist shall have recourse to such methods or shall refrain from making final judgments with respect to matters affecting social welfare.

In his *Economics of Welfare* (3rd ed. London 1929) Pigou made an elaborate attempt to demonstrate the possibilities of a procedure intermediate between analysis of costs in terms of the pecuniary market valuations and analysis of costs in terms which take into account all the cost elements of significance for society whether exactly measurable or not. The analysis is primarily in terms of "private" and "social" product per unit of cost but can readily be translated into terms of private and social cost per unit of product. The marginal private net cost of a commodity is the increment of pecuniary expense incurred by an entrepreneur in producing its marginal unit. Its marginal social net cost is then calculated by making certain adjustments. From the marginal private net cost is subtracted such part thereof as represents merely an increase in the prices paid for the factors of production in consequence of the marginal increase of output, as such expenses of production from the social point of view reflect not a genuine cost but merely a transfer of income between individuals. To the remainder are added items which are genuine costs to the community, although the individual entrepreneur is not required to give compensation for them. For example, there may be increase in the real costs of production to other producers resulting from his expansion of output, uncompensated damages to his neighbors, such as from smoke or noxious fumes or impairment of the amenities of a neighborhood. Pigou emphasizes the desirability of bringing into equality marginal private net cost and marginal social net cost, whether by legal regulation, subsidies and taxes or in some cases by the establishment of monopoly organization or by moral suasion. Otherwise the entrepreneur may either have an incentive to carry production further than is justified or may not have an incentive to carry it as far as is justified

from the social point of view. Since Pigou adheres with minor exceptions to an objective pecuniary measure of cost and product, he is forced to restrict the range of his analysis to those cost aspects of economic activities which are fully amenable to the pecuniary calculus, and the gain in objectivity which results is inevitably offset to some extent by the loss in comprehensiveness and finality of the conclusions reached.

Any rational system of economic organization of society must of necessity take costs into consideration in allocating resources to different employments and in selecting from among alternative processes of production. In a purely individualistic society costs would govern the allocation of resources only in so far as they manifested themselves in entrepreneurs' expenses of production through the ordinary processes of the market. No modern country, however, leaves this wholly to the uncontrolled operations of the market; every government influences entrepreneurs' costs, directly or indirectly, to make them conform more closely to what it regards as social costs. Four main classes of governmental activity in this connection can be distinguished: (1) regulations intended to force the elimination of practises involving social costs which are not adequately compensated, such as safety legislation, regulation of hours of labor, night labor, child and woman labor, zoning laws; (2) measures requiring entrepreneurs to compensate for social costs which otherwise would remain wholly or partially uncompensated, such as legislation requiring workmen's compensation, contributions for unemployment insurance, compensation for damages or worsenments to adjoining property; (3) measures intended to eliminate or reduce the wastes of individualistic competition among producers, such as the suppression of unfair competition, the promotion of standardization of specifications, weights and measures and the establishment of legal monopolies; (4) research and educational activities intended to show entrepreneurs how costs can be reduced through improvements in organization or in technique.

In a socialistic society it would presumably be the policy of the government either directly to administer production and the allocation of resources in such a way as to bring marginal social product and marginal social cost as it sees them into equality in all occupations, or else by reform of the distribution of property and income, the promotion of equality of opportunity and the systematic regulation of production and

exchange to secure the elimination of those sources of divergence between marginal social cost and marginal social income which result in an individualistic society from the discrepancies between marginal private and marginal social net costs.

COST ACCOUNTING. The systems of procedure called cost accounting differ so widely in scope, objective and method that no positive realistic definition of the term is possible. Some systems consist of analyses currently and continuously made, while others are intermittent studies. Some focus upon the unit (average) costs of the several commodities simultaneously produced in an enterprise, while others ignore diversity of product and fix attention upon costs of unit services performed. Many, perhaps most, are intended to assist in maximizing net profits, but others not materially distinguishable from these in scope and method are employed in such non-profit enterprises as, for example, government navy yards.

Cost accounting should be distinguished from financial accounting. The latter is primarily concerned with the net summation of income for successive operating periods and with the valuation of the assets, liabilities and interests in net proprietorship at particular times. No system of cost accounting includes any of these objectives.

Highly developed systems of cost accounting first appeared late in the nineteenth century; they have come into wide use since 1910. This sudden rise is not due to the appearance of new problems. But many old problems have become vastly important with the advent of large scale enterprise accompanied by specialization of production agents and standardization of products. The problem of unused capacity becomes more acute as specialization grows in seasonal industries or in industries especially subject to the perturbations of competition among large concerns. While with the expansion of an establishment its manager is increasingly removed from direct observation of the details of the business, the concomitant increase in the frequency of repetition of many processes makes precise information about them more essential to the success of the establishment.

The first great impetus to cost accounting was given by the work of Frederick W. Taylor and his associates and their followers. Studies by economists, teachers of accounting and engineers, as well as by business men and accountants, have improved method and technique. Instruction in colleges has done much to stimulate the use of new techniques.

Because of the wide variety of problems dealt with by cost accountants, the diversity of the procedures appropriate to these problems and the complexity of individual systems of accounts, discussion of procedure is limited here to that group of procedures that have been invented to analyze manufacturing costs. The objective of cost accounting in manufacturing establishments is to assist the management to maximize profits or to minimize losses. Help toward these ends may be sought in three principal ways. In the first place, unit costs—figures for average cost per unit of each kind of product found by distributing total manufacturing expense among the several products and dividing these commodity totals by quantity produced—may be determined at frequent intervals. Reliable unit costs of this sort are of great help to the management in determining the relative quantity of each type of goods to be

produced. Secondly, costs may be reduced through the use of various currently compiled subtotals of the accounts as indices to disclose at once waste of materials, arrearages in scheduled operations, inadequate employment of men and equipment and inefficient operation of any production element. Thirdly, a better statistical basis for budget making may be provided than that which can be offered by financial accounts alone.

Underlying the day to day cost accounts are a series of analyses of cost problems. The most important of these problems are, first, the segregation of those costs to be treated as direct costs, those to be distributed as overhead or burden and those to be disregarded in the manufacturing cost accounts; second, the estimate, in advance of distribution, of the amount of overhead to be incurred during the next operating period; and, third, the allocation of joint costs.

Although no criteria have been agreed upon for segregating costs into direct, overhead and undistributed groups, direct costs usually include the major items of outlay for materials and services that are specially or directly appropriated to the manufacture of some particular product. The purchase price of the principal materials and the wages of laborers working solely upon a particular product are types of direct expense. By means of stores records and job tickets such expenses are charged directly to the product. Some expenses that are not conveniently and directly assignable to specific products may, nevertheless, be either necessary or incidental to manufacturing and may vary directly with volume of operations. These fall in the overhead group and include outlays for fuel, janitor service, repairs and charges allotted to the period for depreciation and obsolescence.

A continuous current accounting for materials actually utilized is often indispensable, and a similar recording of the specific services of men and machines is both desirable and practicable. But a daily distribution of overhead, even if possible, would be too costly a luxury; and thus the second type of preliminary analysis, the forecasting of overhead, is used. Estimates are made of the total of each overhead expense to be incurred during the next period. These totals are divided either by an estimated total of some other cost, such as the cost of direct materials issued from storerooms, or by an estimated total of some service, such as direct labor hours worked, to obtain a unit burden charge. This unit burden charge is employed as a coefficient

of the daily recorded cost or service from which it is derived. By this means charges for overhead cost are distributed in the daily accounting.

Since the estimates upon which burden rates are based are subject to error, it frequently happens that large discrepancies arise between manufacturing expenses incurred during a period, as shown by the financial accounts, and manufacturing expense charged to products during the period. There is another estimating error of different type but of a more serious kind: cost accountants in seeking to reconcile their records with the expense accounts in the financial books have too often been willing to accept and use a depreciation formula merely because a reasonable, year by year, aggregate charge is obtained by its use. In cost accounting appropriate machine by machine estimates of depreciation are requisite to reliable unit costs; erratic distributions of correct totals may cause harm. Even the writers who favor the machine hour methods of distributing overhead, methods in which this type of error is most significant, seem largely to be unaware of this source of unreliability in unit costs.

The third type of analysis underlying the cost accounts is the allocation of joint costs. The problem of distributing the costs of a basic material and of processes prior to separation of material among coproducts or among main product and by-products has long occupied the attention of business men as well as of engineers and cost accountants. Among the proportional bases of distribution of these joint charges may be mentioned: weight, bulk, market prices at which materials in the segregated stage could be bought or sold, sales prices of the several finished products, sales price less separate costs of each product, estimated sales price less estimated separate costs of each product. Often all costs are charged to one product and the sales of the others are treated as deductions from the cost of the main product. Many of these methods may have fantastic results.

A second important class of joint costs is presented by those outlays made to acquire, own, maintain and operate the fixed assets employed in manufacturing. Those expenses special or incidental to unusable capacity of assets fall within this class, although they present special difficulties of their own. These costs are distributed by means of burden rates attached to some direct charge or some function of a direct charge, such as percentage load on materials cost, percentage load on direct labor

costs, dollar rates on man hours of direct labor performed on product, dollar rates on machine hours worked by each class of machine used in direct processing, and combinations of two or more of the foregoing systems. Sometimes these rates are calculated for a standard volume of operations per year, even though the expected volume may be far above or below this standard amount.

Costs may be jointly incurred with respect to different successively manufactured goods as well as to different concurrent products. Costs may be joint as between successive periods regardless of whether like or different products are made. Needless to say, the problem of analyzing joint costs is seldom limited in any enterprise to a single one of the types mentioned.

Cost accounting procedure rests upon oversimplified and largely arbitrary fundamental analyses. In assessing the value of cost accounting service the cost accountants' own estimates of the utility of the unit costs which they find must not be taken too seriously. An examination of the procedures, reduced to formulae, whereby the unit costs are found, shows in many systems that the figures produced cannot possibly have the properties attributed to them; in many instances, indeed, it is incorrect to call them costs at all.

The utility of any cost accounting may, however, depend very little upon the theory of cost imputation implied in its unit cost formula. Fundamentally, the statistical data of cost accounting report the yielding of services by productive agents and the absorbing of those services by products. Reports are given for each class of material, the amounts ordered, amounts received, amounts appropriated to specific production orders, amounts issued for processing; for labor hours of work done, work assignments made, pieces processed; for machine assignments, machine hours worked and machine processes completed. These figures, which do not become cost data until they are multiplied by monetary coefficients, are the ones upon which a works manager relies to reveal threatened shortages of necessary materials, arrears or disorders in operating schedules and deviations from standard practices. Major services are thus rendered by the data before they are inserted in the unit cost formula, indeed before they become cost data at all.

It cannot be said definitely that it is now possible, or will shortly become possible, by means of cost accounting greatly to extend the rational-

izing of management or of economic activity, to stabilize competition or to facilitate social control of industry. Such results must await both the invention and widespread use of reliable unit cost formulae. With the exception of a few experiments not as yet fully reported no attempts have been made to obtain costs resembling the economists' "marginal costs" or "differential costs."

Since the name is given to so wide a range of practise it is impossible to describe the extent to which cost accounting is used beyond indicating the prevalence of fairly elaborate systems. In the United States and Canada these will be found in most of the large scale manufacturing and refining plants. Highly developed systems prevail in large mining operations; they are rapidly spreading in construction and in shipbuilding. Certain cost accounting devices have been used for many years by railroad companies and in hotel keeping. The spread of cost accounting to other forms of enterprise, such as farming, merchandising and banking, has been confidently predicted, but many systems which have been tried in these fields have been quickly abandoned. In Great Britain, particularly in Scotland, cost accounting was begun fairly early but made no great headway before the World War. Since that time there has been a considerable increase in the use of cost accounting methods, most of which resemble American practise. Cost accounting was introduced even later into the more industrialized countries of continental Europe and Japan and there it has followed largely American and British procedure.

The National Association of Cost Accountants is the chief society of the practising profession in the United States. Both through its membership of public accountants, engineers and business managers and through active affiliations with other national and local societies a great many avenues for exchange of ideas and of experience have developed. Since cost accountants, as such, do not practise as principals but are, rather, corporate officers and employees in large organizations, little or no statutory control over practise has been proposed.

COST OF LIVING. Interest in the cost of living has always been most acute during a period of rising prices. Then the equilibrium of existing social classes is upset; commercial groups thrive while creditors, salaried persons, wage earners, suffer. Thus the minds of the Elizabethan writers were full of the great price revolution of the sixteenth century. The wages rated in the old Statute of Labourers were "not answerable to this time"; the change was "without all conscience or reason." The same complaint reappeared in the course of the Napoleonic wars and again in our own day during the high cost of living period since 1900 and in aggravated form with the World War.

A remedy often proposed is the fixing of prices by government agency. In war time price regulation is of course usually necessary in order to coordinate a nation's resources. During the World War all the combatants had to resort to rationing. Cooperative buying and domestic production were encouraged, advertising was frowned upon, middlemen's profits were scrutinized, competing services were forced temporarily to combine.

The regulation of ordinary retail prices, however, was dropped in most cases as soon as the acute physical scarcity of the war period was over; the feature longest maintained, because of continued shortage of supply, has been the fixing of house rents. The rationalization of distributive machinery—the saving of duplication and waste by uncontrolled competition—ceased, and only some small measure of combined opposition to "profiteering" remains. The point of view of the man of affairs toward any control from above is well expressed by the former chairman of the British Food Commission: "The tendency is for the price to be fixed

at a point which will give the least efficient producer a living."

The other remedy commonly demanded when prices rise is an adjustment of wages. In Elizabethan England this was simple and inevitable, since maximum wages had been set traditionally by statute in any case. Henceforth the scale was to be revised periodically by the justices of the peace—a more flexible instrument than Parliament—in accordance with the price of "corn," so that "both in time of scarcity and plenty" it might "yield the hired person a convenient proportion of wages." This system persisted until the beginning of the industrial revolution.

In wartime Europe and America the problem was more complicated, although American prices rose far less than European: at their height in 1920 they were not above 216 on a pre-war base and from 1922 to 1930 they remained around 170. Nevertheless, with the first sharp rise of prices in the early years of the war workmen in key industries everywhere began to demand war bonuses. In continental Europe the economic strain was such that the demand was only partly met, by granting special bonuses to men with families. Governments took the lead, finding family grants to civilian employees an easy step from separation allowances for the military. When this procedure was adopted it led to discrimination by certain industrial concerns against men with families, and groups of employers in various places formed equalization or clearing funds whereby the costs of the family allowances were prorated among the entire group. The system spread during the post-war inflation and is still in force in one form or another for a total of nearly six million workers in France, Belgium, Germany, Austria and other central and north European countries.

In England and America the family allowance system was never attempted. But here as elsewhere wage increases were imperative during the war, and the government agencies charged with maintaining industrial peace had to furnish some index of living cost changes. In America the United States Bureau of Labor Statistics developed figures which were used by many employers, although many more preferred to compile their own or to rely upon a series presently issued by a research federation of several large employer's associations, the National Industrial Conference Board. Altogether up to 1925 it has been estimated that not less than five or six million American workmen had their wages ad-

justed with definite regard to some index of living cost changes. Other factors, however, such as the prosperity of the industry or the going rate of wages elsewhere, commonly entered each settlement. In Great Britain as late as 1922 actual sliding scales of wages based on the Ministry of Labour's index were in force for nearly three million workers; however, even here the changes granted were usually somewhat less in either direction than the cost of living change.

While the swing of the business cycle was upward, living cost agreements once made were relatively easy to keep, for employers, bidding against one another for labor in any case, would gain little by refusal to grant increases. But after 1920 with falling prices labor in many cases offered heavy resistance to proportional reductions. Then for the first time labor counsel, in America especially, began to lay great stress, not upon changes in cost of living, but upon the basic cost of living, a minimum budget in commodity rather than price terms. The clothing and the printing trades, as well as certain railroad groups, were quick to make use of this argument for bettering the admittedly inadequate original wage. As a consequence, after much controversy, in many of these trades the wages of the lowest paid employees were not reduced proportionately with the rest; in many others the living cost clauses in their agreements were abrogated. Today with almost stationary or declining prices for seven or eight years labor appears on the whole to have lost interest in the subject, though various employing groups still urge the clauses as a form of future insurance. The habit in labor circles of appeal to a basic budget appears, however, to have come to stay.

In another sphere the question of a basic budget has had a longer history. All minimum wage legislation has had to take living costs into primary consideration. The boards set up under the laws to fix rates may bargain as well as analyze, but at least they bargain upon a "living wage" understanding. In Australia and America the cost of living criterion has been explicit; in England it has been largely overshadowed by consideration of the rates paid by the "better employers" of the district. Everywhere, however, where enforcement has been adequate the result has been to raise wages nearer to a "living wage" level.

In America the laws now languishing because of an unfavorable Supreme Court decision [*Adkins v. Children's Hospital*, 261 U. S. 525, 43 Sup. Ct. 394 (1923)] applied only to women, and

the usual standard was "the necessary cost of living" and "health" for the single woman living away from home. In Australia the application is general and the standards high: the cost of living for families is held to include "frugal comfort."

It is interesting, however, to note upon what slender cost data the awards in the leading earlier Australian cases were based. "Nine housekeeping women," "a landlord as to rents" and "a butcher as to meats" appear to have been the only guides of Justice Higgins in the celebrated *Harvester Case* (2 Com. Arb. Rep. 1). Frequently careful indices of price changes were then applied to these casual early budgets.

The standard size family allowed for in the Australian awards, the family of five, with three children dependent all at once, has been accepted also in American and English cost of living studies. As a matter of fact, at any given time the average family will not contain so many dependents, although at some time—perhaps a very critical time for young children—it may pass through such a phase. Besides, the very large families are shrinking; in Great Britain, according to Professor Bowley's findings, enough to affect noticeably the incidence of poverty. In France the two-child family is used as the standard in cost studies. Recently the National Industrial Conference Board has advocated a two-child standard in the United States.

For women wage earners the accepted cost standard is the single woman living away from home. Employers have often argued for the cheaper but "more prevalent" cost of living in the family group—a standard itself, however, frequently rendered necessary by the lowness of the wage received. At the other extreme the United States Women's Bureau has argued for a budget to include the cost of dependents. Professor Bowley's study, however, indicated that the incidence of dependency upon women is still very small.

Economic theory has long recognized that wages tend to adjust themselves to, among other things, the worker's standard of living. But in Ricardo's day this meant a bare subsistence. His "natural price of labour," even though he defined it as the price of food, necessities and *conveniences* become essential to the laborer and his family *from habit*, meant to contemporary readers but an "iron" law. The laborers' habits appeared to be permanently conditioned to something very close to starvation.

Labor students now generally maintain that while marginal productivity may set an upper

limit to wages competition is not sufficiently perfect to insure attainment of that limit; and that there is a lower limit set by the standard of living. Between these two limits the actual wage will be set by bargaining.

The collection of basic budgets has been essential to cost of living study. On the intensive side the pioneer work is that of I. C. Play. Living with one working class family at a time in various countries of Europe during the 1830's and 1840's he secured a series of family monographs that for exhaustiveness have never been excelled.

For statistical generalization, however, the more rapid survey method is necessary (*see FAMILY BUDGETS*). Today this is usually undertaken by a corps of special agents who spend but a few hours with each family. Gross error becomes surprisingly infrequent when the schedule is made sufficiently detailed. Sometimes this questionnaire method is supplemented by account books kept for a period of weeks. On the continent of Europe large numbers of such accounts are sometimes kept for a year at a time, but American housewives are not so patient.

The father of the extensive method of surveys was F. M. Eden, who in 1795 set about unaided to determine "the State of the Poor" in rural England. His example inspired the statisticians of the 1850's to have Dupcétiaux commissioned to undertake the first cost of living survey for the government of Belgium. In Prussia Dr. Ernst Engel took up the task (*Der Kostenwerth des Menschen*, Berlin 1883; *Die Lebenskosten belgischer Arbeiter*, Berlin 1895) with an inquiry into the cost of bringing up a man, including amortization of children dying or never reaching self-support. Engel developed an annual cost scale, running from infancy to maturity, for the individual in the family group. The adult man ranked at three and one half times the infant unit (later named the *quet* in honor of Quételet), the adult woman at three times. The scale was arbitrary but proved extremely convenient for comparing the costs of families of different sizes. It is still in use in Belgium, Switzerland and elsewhere.

In America the Atwater food consumption scale, using the adult male as unit, has commonly been employed for the same purpose. A refinement upon it by Sydenstricker and King, the annain scale, gives weight to the individual consumption of items other than food, such as clothing, recreation and the like. If recalculated for more representative communities

(the Sydenstricker-King communities were poverty stricken) it should prove very valuable.

Pioneer work in extensive cost of living surveys was done in the United States by the Massachusetts Bureau of Labor and later by the United States Bureau of Labor Statistics under Carroll D. Wright. The reports of the Commissioner of Labor for 1890-91 contain data on some 8500 families in certain selected industries, and that for 1903 on no less than 25,000 over the country at large. No attempt was made to set up any derived standard, but the reader is left to see how apportionment of expenditure changes with successive income levels. For food the American proportion was 43 percent as compared with the Belgian 67 percent or Eden's 75 percent. Like Dupétioux, Wright selected a portion of his families to contain a "normal" number of children (in his case one to five, all dependent; in Dupétioux's four, only two dependent), and it is the expenditures of these "normal" families that have been used as weights for later retail food and living costs indices. Wright, moreover, used an unexplained food consumption scale to measure size of family. This rough scale has been retained by the department.

Among private surveys the most noteworthy have been Booth's and Rowntree's in 1890 and 1901, undertaken to measure the prevalence of poverty in London and York respectively. Both found "poverty" covering nearly a third of the industrial population even under the most rigid definition of the term. The "cost of living" (above poverty) was taken to mean merely adequate animal subsistence.

A similar social interest has guided most of the pre-war surveys in this country. Mrs. More and Chapin in 1907 and 1909 in New York and Kennedy in 1914 in the Chicago stockyards district were all interested in the drawing of the poverty line. The actual standards of living, however, which they set up on the basis of their findings were in every case intended to be higher than bare physical subsistence (see STANDARDS OF LIVING). "American," "normal," "fair," were the terms they used. In money terms for a family of five these standards cost from \$800 to \$900 then, or about \$1400 at the end of 1929.

Since the war, with rising consumption habits, there has been a tendency to rate these pre-war standards as "subsistence" levels and to scale up from them to "health and decency" ("subsistence plus") and to "comfort" levels. This was substantially the practise of the Na-

tional War Labor Board and of the United States Bureau of Labor Statistics in the various theoretical budgets they drew up from 1917 on. Employers represented in the National Industrial Conference Board have been trying to checkmate this tendency. They claim that the true "American" cost of living is still made up of the typical goods and services which labor could command before the war.

This points to a dilemma in all cost of living studies. A theoretical budget for a theoretical family, however closely based upon observed habits, always contains an element of the ideal. On the other hand, an actual budget of an arithmetically average family leads only to a foregone standard. Of course the cost of living of any group will be whatever that group has to spend, be it little or much. The wage level will condition the consumption habits.

The problem becomes peculiarly pressing in studying the cost of living of different parts of a country so extensive as our own. Differences in cost of living between various sections and between urban and rural districts are frequently due far more to variation in content of the budget than to variations in price for an identical commodity budget in the different sections. Between different countries, and especially between Occident and Orient, living standards become too different to admit of ready cost comparison. Statistics here properly give way to description.

Precision in the measurement of living cost changes has become possible only lately with the rise of the science of index numbers. A century ago Joseph Lowe in England, closely followed by Scrope, pleaded in vain for a "tabular" or multiple commodity standard of value for wage payments and indeed for all forms of deferred payment. This proposal was really a forerunner of Professor Irving Fisher's plea of today for the "stabilized dollar," but in Lowe's view the pound sterling should be left alone and the revision applied only to the realm of voluntary contracts. Jevons, a generation later, was more successful in arousing interest in possible price indices, and in 1869 the London *Economist* began the oldest series of wholesale prices which is still current. Since 1900 wholesale indices have become very numerous. In 1902 the United States Bureau of Labor Statistics began its index of wholesale prices. But retail price indices came much later. It was considered too difficult to secure identity of quality in the goods and to strike averages between different local price

quotations. Yet for cost of living purposes the wholesale series were obviously inadequate, since wholesale prices fluctuate more violently than retail. In 1907 the United States Bureau of Labor Statistics made a beginning with its index of retail food prices, using for weights the consumption data furnished by its great 1901 budget survey. By the outbreak of the war the leading European countries had food indices, while Canada and Australia published data on rents and fuel as well. Completed indices, however, had to wait for the pressure of the war itself.

In America the Bureau of Labor Statistics in 1918-19 surveyed the expenditures of some 12,000 families in ninety-two shipbuilding and industrial centers, priced their purchased commodities back to 1914 and so began a series with post-war weights measuring changes from pre-war costs. Food in these new weights had gone down to 38 percent of the budget, while clothing and sundries had gone up. Today the bureau publishes a combined index for the country as a whole, besides separate indices for all the leading cities. The National Industrial Conference Board also publishes a nation wide index, using the bureau's figures for retail food prices but having separate reports on the other items of the budget. It uses pre-war weights, chiefly those of 1901, and for periods of rising prices its figures consistently run a little lower than the bureau's. This difference may be due not only to the weights but to the inclusion of more small towns, a shorter list of articles and dependence upon the questionnaire method of returns from merchants. The bureau uses field agents, maintains very strict identity of articles priced and secures multiple quotations on each.

The British Ministry of Labour index has been carried out much less expensively than the American. Its original survey in 1904 was far smaller though intensive, and its present price list is shorter; for instance, it mentions only fourteen carefully selected food items as compared to forty-three in the American index. Weights are as of 1904, while the base is 1914. Returns, as in most European countries, are secured largely by agents charged with other government duties. Sixty percent of the budget is allotted to food, as compared to Canada's and Australia's 35 percent.

In Germany before 1920 various city offices struggled in vain to keep ahead of the inflation, but since that year the Statistisches Reichsamt has published a national index. Weighing here, as in most indexes on the continent, is post-war

with present scarcity very evident; e.g. food and rent, which in America cover half the budget, here cover three fourths.

France has never published a national index based on a complete budget nor indeed made any general cost of living survey. Local indices have been published by a host of joint commissions representing employers, employees and third parties set up by the government during the war, but their basic budgets are for the most part sketchy and vary greatly among themselves. Food usually runs to 60 percent and over in the more complete budgets.

In Italy the Milan index is interesting as showing the effects of the "dilution" of a standard during wartime scarcity. Calorie requirements were cut down 40 percent below the Atwater standard and cheaper foods than the pre-war substituted. The apparent cost of living in Italy would therefore appear moderate.

Continental housing estimates also run low. Most of the German indices, the Austrian and those of the Italian cities assume two rooms and kitchen. In contrast, the Canadian index specifies "6-roomed houses in good condition with good modern conveniences."

Perhaps the most elaborate index in the world is published by the city of Amsterdam. Its food budget alone contains over two hundred items. The original figures were based on full year account books and weighted by the quet system. For a time the city made fresh budget surveys every year, as the content of the living standard changed.

Very thorough indices are published by Belgium and Sweden. Sweden actually succeeded in having account books for over a thousand families kept for a year. Both took the families as they came and reduced them to income classes later on a consumption unit basis. Belgium now publishes its data on that basis, running a multiple, 5-class index "per quet per fortnight." The lowest class expends over 68 percent of its income on food. The differences in variations between the indices are, however, negligible: probably one would serve as well. In contrast, Norway, also very thorough, publishes an index in which the families are selected according to a specified income range. This is nearer the American 1918 procedure, where attention was concentrated upon only the most typical working class groups in each community.

Middle class groups have never been adequately studied anywhere, but especially not in America. In a number of continental and colo-

nial surveys place is made for the living costs of minor government officials. In America in 1919 the United States Bureau of Labor Statistics published a highly detailed minimum comfort budget for the family of a government employee in Washington, but it was theoretical. So too was the standard for the single woman clerical worker. Recently private investigators have made small cost surveys of certain university faculties, and the Bureau of Home Economics is beginning an account book study of professional families. But that is all. No one has yet had the temerity to study the cost of living of the small entrepreneur.

The cost of living of the agricultural classes is also underrepresented. It finds no place in the 1918 survey, and the studies recently published by the Department of Agriculture covering nearly 3000 farm families during 1922-24 lack uniformity. So far as they go, however, they show an unexpectedly close parallelism to the cost allocations of the industrial worker of 1918. Even rent occupies only 1 percent less of the farmer's than of the city dweller's budget, although the content of the housing standard of course is very different.

The International Labour Office brings together index numbers of wages and cost of living published by various countries. The bases vary according to the year in which each country began the collection of statistics but are in general 1913 for wholesale and 1914 for retail prices. The cost of living figures cover food, clothing, heat, light and rent, with all other items grouped under "miscellaneous." However, the variations in methods of gathering statistics and in living standards in the different countries make these indices hardly comparable.

When standards change with time, what shall the student of living costs do? The index he handles is rigid. His answer will necessarily depend upon his object. During the war the British Ministry of Labour refused to "dilute" its index, although current consumption, as shown by an extensive fresh study, had adjusted itself to necessity. Professor Bowley pointed out that this meant a loss to the government of something like 15 percent on its wage awards. But the ministry held that "cost of living" referred to normal not wartime habits. On the continent the tacit assumption was the opposite.

In America standards during and since the war have patently been going up, and there is no sign of their returning to an earlier level. Moreover, their content has changed greatly. Rayon,

automobiles, the radio, the telephone, electric lighting, bathtubs, have shown extraordinary increases in consumption. Yet American budget weights are still as of 1918. For a general purpose cost of living index it would seem that weights ought to represent prevailing consumption for the most numerous groups of the population, including agricultural as well as industrial classes; and for this a fresh survey should be made at least every ten years.

COSTA, ANDREA (1851-1910), Italian socialist. Costa was one of the most important pioneers in the Italian socialist movement, and his career is to a large extent an epitome of its development during the period from 1870 to 1910. At the age of twenty Costa became secretary to Bakunin and like many of his fellow internationalists was deeply influenced by the anarchistic doctrines and violent revolutionary program which the Russian agitator was attempting, despite the opposition of Mazzinian nationalists, to introduce into Italy. Convinced at first that Bakunin's methods provided the only remedy for the distressingly backward conditions prevalent in Italy, Costa actively co-

operated both as organizer and as journalist and in 1874 took charge of plans for an insurrection at Bologna. But the complete collapse of this attempt, coupled with a similar fiasco at Benevento in 1877 - which he had vainly tried to forestall - raised serious doubts in his mind as to the efficacy of violence. During the ensuing period of exile in Switzerland and France, where he had the opportunity of studying a more advanced economic organization as well as the methods of a more experienced labor movement, he became even more conscious of the limitations of his early views. These factors, heightened by the influence of Anna Kuliscioff, alienated him completely from abstract revolutionary theory. On his return to Italy in 1879 he definitely abandoned his former allegiance and became one of the outstanding leaders of the Marxian wing of the party. With a more realistic orientation Costa and the bulk of Italian socialists formulated a new program, which shifted the emphasis of socialism to peaceful organization of the working classes, to participation in the cooperative movement and to a more careful study of the economic and moral needs of the people. In 1881 Costa founded the socialistic journal *Avanti* and in the elections of the following year drew up the platform of the Marxian Socialists. With occasional interruptions due to short terms of imprisonment or exile he was a member of the Chamber of Deputies from 1882 until the year before his death. He became increasingly influential in parliamentary circles and was responsible as much as any other figure for the decisive influence exerted during the first decade of the century by the moderate wing of the Italian Socialist party.

II (Florence 1926); Orano, Paolo, *I moderni*, 5 vols. (Milan 1914) vol. III, p. 135-97; Zabordi, G., *Un cavaliere dell'ideale* (Milan 1916); *A. Costa, episodi e ricordi* (Milan 1910).

COSTA FERREIRA, ANTÓNIO AURÉLIO DA (1879-1922), Portuguese educationist, administrator and politician. Costa Ferreira was a physician by profession. He early distinguished himself by his investigations in anthropology and experimental psychology applied especially to the treatment of the mentally abnormal. He also held public office connected with the administration of welfare services, and as a reward

for his enthusiastic work for the establishment of the republican form of government in his country the cabinet portfolio of *ministro de fomento* (public welfare or public aid) was given him in 1912. The principal interest, however, of his modest and sympathetic nature was the education of unfortunate children; hence in 1913 he resigned his high position in order to apply his pedagogic ideas as director at the Casa Pia of Lisbon, a refuge for fatherless children and for those subjected to a harmful environment. To the education of the mentally retarded he dedicated the *Colônia Agrícola de San Bernardino* in Peniche. Outstanding among his labors with this group are those dealing with disturbances of speech, particularly stuttering, for whose correction he initiated measures of a kind superior to those then in use. He reached the conclusion that stuttering is a phenomenon of mental origin, resulting from a morbid emotional diathesis, whose treatment, like that of the other tics, demands above all that the mental or rather emotional state of the patient be constantly considered.

During the World War he served as a physician and provided for the care of wounded soldiers at his Instituto Medico-pedagógico de Santa Isabel, where he introduced a system of reeducation of the mutilated, their adaptation to various occupations and their professional orientation. He regarded the administration of this service as an economic, juridical, pedagogical and psychological problem resembling that of labor accidents. He deprecated undue philanthropic, military and medical emphasis and advocated the use of the Taylor system of scientific management in determining the economic value of the disabled.

C. BERNALDO DE QUIRÓS

Consult: Interallied Conference on the After Care of Disabled Men, First, Paris 1917, *Compte rendu*, 3 vols. (Paris 1919) vol. II, p. 212-14, and Third, Rome 1919, *Atti* (Rome 1919) p. 743-46.

VII (1921-22) 167-78, and articles containing bibliography in vol. VIII (1923) 539-95. Also, Pestana, Alicia, *La educación en Portugal* (Madrid 1915) p. 48-63.

COSTA Y MARTINEZ, JOAQUIN (1846-1911), Spanish jurist, political theorist and reformer. Costa turned to the study of law after working in the office of an architect for several years, and in 1872 he obtained his degree

and became a notary in Madrid. He was a prolific writer and his works deal with history, geography, economics, sociology and law.

Costa played a prominent part in the movement for regeneration which followed the Spanish colonial disaster of 1898. He believed that Spain in order to survive must give up its imperialistic ambitions and must adapt itself to European standards and methods. In 1900 he published *Reconstitución y europeización de España* (Madrid); in 1901 the *Crisis política de España* (3rd ed. Madrid 1914) and *Oligarquía y caciquismo como la forma actual de gobierno en España* (Madrid), a notable study of the evils of Spanish public life. His writings stirred Spain more profoundly than those of any other thinker of the period and his work has been compared to that of Fichte. His books, articles and speeches were widely read while his slogans "School and larder" and "Reorganization of production, reorganization of education" became bywords. For the realization of his policy he organized the National League of Producers in 1899, which was a union of agricultural, industrial and commercial councils. He had hoped that the state would carry out his program, which included the building of canals and roads, drainage, home colonization, educational reform, social insurance, reduction of the army and navy budgets, simplification of justice and reduction of its cost and municipal decentralization. When the monarchy refused to adopt it, Costa espoused the republican cause, with which he was allied until his death. His ideas, however, influenced all the other political parties and even governmental policy.

Costa was also prominent as a jurist. A firm believer in the comparative method in legal history, he was the first to apply it to Spanish law. His works are distinguished by a remarkable knowledge of sources and by excellent methodology. The *Derecho consuetudinario del Alto Aragón* (Madrid 1880) stands as a model study of customary law. His other important legal works are *Teoría del hecho jurídico individual y social* (Madrid 1880, 2nd ed. 1914) and *El problema de la ignorancia del derecho* (Madrid 1901). *El colectivismo agrario en España* (Madrid 1898, 2nd ed. 1915) is a very complete discussion of the customary organization of real property in Spain and of the leading theories on this problem from the sixteenth to the end of the nineteenth century.

COSTE, ADOLPHE (1842-1901), French sociologist and president of the Société de Sociologie. He differentiated decisively between "social facts" (belief, solidarity, politics and economics) and "ideological facts" (non-practical arts such as poetry, philosophy and theoretical science), insisting that there was no correlation between them and that only the study of the former was the province of sociology. Following the fashion of the sociologists of his day he considered social facts as following a definite linear sequence of evolutionary stages. These, he held, were primarily determined by the increase of population and its density, and he therefore stressed the importance of demography for sociological research. As population grows and becomes more concentrated, social differentiation and coordination increase and there come about progressive division of social functions and equalization of social conditions, political evolution developing from absolutism to the separation of powers, economic evolution from neuromuscular effort to the methodological organization of mechanical production, and the evolution of beliefs from polytheistic religion to rational science. Social progress is achieved by the subordination of ancient social institutions or of their survivals in new modes; thus the family, religion and property persist while losing their former significance.

COTTA, JOHANN FRIEDRICH, BARON VON (1764-1832), German publisher. With tenacious zeal and quiet determination Cotta built up one of the greatest German publishing houses, issuing besides newspapers and works of belles lettres scientific literature and periodicals. In 1811 he started a printing establishment in Stuttgart. A branch was formed in Augsburg, and in 1827 a lithographic and copperplate establishment in Munich was annexed. Cotta's son, Johann Georg, further expanded the enterprise. By the publication at popular prices of almost all the German classics and

by the payment of royalties to authors on a scale hitherto unknown the Cotta publishing house contributed significantly to German cultural development.

Cotta was one of the first in Germany to own, publish and edit a periodical, thus introducing a new system of journalism which later became general. Two of the journals and newspapers published by him attained special fame and exerted a lasting political and literary influence. The literary journal *Horen* (Tubingen 1795-97) was edited by Friedrich von Schiller with the cooperation of Goethe and Herder. The *Neueste Weltkunde* of Tubingen, founded in 1798, later the *Allgemeine Zeitung* of Stuttgart, was one of the earliest popular literary-political papers and had great political influence, with a considerable circulation in all the German states as well as abroad. It was from the outset markedly liberal and pro-French and espoused the Austrian cause in the struggle for German unification. Owing to censorship difficulties, which frequently confronted Cotta, its place of publication was changed several times. Since the founding of the German Empire the paper has been slowly fading in importance; in 1895 it was sold by the Cotta firm and in 1929, when it was known as the *Allgemeine Zeitung am Abend*, it ceased publication. Other important Cotta periodicals have been: *Europäische Annalen* (1795-1820), continued as *Allgemeine politische Annalen* (1821-32); *Das Staatsarchiv* (Häberlin, 1801-06); *Polizeifama* (Hartleben, 1802-36); *Jahrbücher der Medizin als Wissenschaft* (1804-09); *Archives littéraires de l'Europe* (1804-09); *Morgenblatt* (1807-65); and *Das Ausland* (1828-93).

In 1815 Cotta was a member of the Württemberg Diet. He was interested in the development of steamship traffic on inland waters, conducted several foreign political missions and aided in the creation of the Zollverein. At the Congress of Vienna he was a member of a committee on the freedom of the press.

COTTON. The origin of cotton is not known. Although species of the plant are native to all tropical or semitropical countries, modern commerce in cotton had its beginnings in India. The *Rigveda*, written before 1500 B.C., indicates that cotton was grown and manufactured at that time. The laws of Manu, probably compiled before 400 B.C., specified the use of the threads of cotton in certain sacrificial rites. Herodotus during the fifth century B.C. was the first to bring a description of cotton and its uses as far west as the Mediterranean. From that time onward the knowledge of cotton as well as its cultivation and uses spread westward into Persia and Sicily, from Persia into Turkey and Greece and from Sicily into Spain about 900 A.D.

The crusades introduced cotton and cotton goods to western Europe, and the light, highly colored fabrics from India were eagerly sought. Cotton thus became important in the commercial development of the Italian cities and in the establishment of trade routes across Europe and later was one of the prizes for the discovery of an all water route to India. It met determined opposition from wool in western Europe, especially during the seventeenth and eighteenth centuries, and high tariffs and embargoes were used to prevent importations. The results were wholesale smuggling and the manufacture of imitations. During the seventeenth and eighteenth centuries the introduction of raw cotton was greatly aided by the predominance of mercantilistic ideas, which advocated among other things free importation of raw materials. But the new cotton industry was comparatively unorganized and unrestricted and the demand for its products was in excess of manufacturing ability. These conditions greatly facilitated the industrial revolution in cotton manufacture of the last half of the eighteenth century. From 1764 to 1800 the consumption of cotton more than doubled every ten years in England. The price of yarn graded at 40 was quoted at 16 shillings per pound in Manchester in 1779, whereas in 1799 it was only 7 shillings and 6 pence. The effect on the price of raw cotton was the opposite. West Indian cotton was quoted at from 19 cents to 28 cents in 1771, whereas in the early nineties it averaged 50 cents. The lower price of yarn and cloth due to improved processes of manufacture expanded the demand for it enormously. The phenomenal growth in demand continued from 1801 to 1860. In 1801 the United States consumed 30,000 bales of 400 pounds each and in 1860 over a million. In

1801 England consumed 120,000 bales; in 1860, 2,614,000. Continental Europe consumed 75,000 bales in 1801 and 1,723,000 bales in 1860.

The higher prices of cotton at the close of the eighteenth century stimulated production in many countries but particularly in the United States and in Egypt. Lower production costs resulting from the introduction of Whitney's saw gin and the further development of the slave plantation system were also leading causes of the rapid increase in size of the American crop. Until almost the close of the century cotton cultivation in the south Atlantic states was a relatively unimportant activity of but local significance and the West Indies were a much more important cotton producing and exporting area. In 1784 only about fourteen bales of cotton were sent from the United States to England, but by 1852 the United States produced over three million bales a year, far more than any other country. During the years just preceding the Civil War over two thirds of the entire crop was exported; the majority of it went to England. Starting in South Carolina and Georgia this cotton kingdom spread north to Virginia and constantly westward into new country. There was a mania for acquiring new fertile land west of the Alleghenies, and many planters moved with their slaves and other property into the land of promise. By 1830 the new western country surpassed the Atlantic states in cotton production, and by 1860 the cotton belt had been extended into eastern Texas.

About 1820 Mohammed Ali, pasha of Egypt, became personally interested in improving and expanding the cotton growing industry of his country. The production was raised from 900 cantars of ninety-nine pounds in 1821 to 596,000 cantars in 1861, and by the end of the Civil War in the United States this figure had increased to 2,140,000. India was also a major source of raw cotton during the first half of the nineteenth century, and the volume of its production steadily increased.

Cotton production in the United States was severely set back by the disorganization following the Civil War. Many sections of the southeast never entirely recovered. Before the close of the century, however, great areas were opened in Texas and Oklahoma and the total production rapidly increased. Since about 1910 the cotton belt has been extended further into the southwest by means of irrigation. The most important of these newer regions are in southwestern Texas, the Salt River valley and the Pima region

of Arizona, and the Imperial and San Joaquin valleys of California. An impetus was given to this movement by the development of the long staple American-Egyptian cotton by the Department of Agriculture. It was hoped that this crop would partly replace the long staple sea island cotton which had in large part been destroyed by the boll weevil. Cotton production is definitely moving to the southwest. In the years from 1909 to 1913 states west of the Mississippi had 16,969,000 acres in cotton, or 49 percent of the total; in 1929 they had 28,760,000 acres, or 62 percent of the total. In the season 1928-29 the United States had about 53 percent of the 85 million acres of the world devoted to cotton cultivation and grew about 56 percent of the total production of the world.

To free themselves from dependence on the United States and as part of the movement for national economic self-sufficiency each of the great cotton textile manufacturing countries attempted to secure its own source of raw cotton. England has made the most far reaching efforts in this direction. Much of its success has been due to the British Cotton Growing Association founded in 1902. The quality of cotton in India has been improved. New growing areas have been started or primitive ones stimulated in many parts of the empire, the most important of which are Uganda, Anglo-Egyptian Sudan, Tanganyika, the Lake Chad region, Queensland and Iraq. Excluding India, the cotton crops of the British Empire more than quadrupled between 1918-19 and 1927-28. The association has aided cotton planters by supplying selected seed, often without charge, obtaining machinery and equipment for them, acting as their selling agents in England and financing gineries in new districts. In some instances it has also given price guaranties to empire cotton grown under specified conditions. The Empire Cotton Growing Corporation, which has published in London since 1924 the *Empire Cotton Growing Review*, has through its research work and information service since its establishment in 1921 also helped enlarge and improve the cotton crops of the empire. Local agricultural departments have also aided in this work in recent years.

Between 1900 and the World War Germany made considerable headway in developing cotton production in its African colonies. Similar efforts by France in her colonial possessions with the aid of the Association Cotonnière Coloniale, and by Italy in Eritrea and Italian Somaliland

have been much less successful. Japan since its war with Russia has made considerable progress in developing cotton culture in Chosen. Of much greater significance are the increases in production and plans for further expansion in Transcaucasia and Turkestan in Soviet Russia. Here machine production is being introduced and transportation facilities are being developed under government supervision. Although production had diminished by 1920 to about one thirty-fifth of the pre-war level, by 1928-29 it was already 27 percent greater than in the period preceding the war. Production is also increasing appreciably in Egypt, which has for years been noted for its long staple cotton, and is expanding very greatly in India. In this latter country the area devoted to cotton growing has more than doubled since 1900, while production has trebled. Many new regions have been opened, several with the aid of irrigation. There has also been marked improvement in the quality of Indian cotton.

The world distribution of cotton acreage and of production is presented in some detail in the accompanying table. Cotton is by far the leading textile raw material of the world, constituting about 80 percent of all textile raw materials. The world's supplies of raw cotton are continuing to expand rapidly with the aid or encouragement of most of the great competing nations; but there is no general plan and no international control.

Except for a negligible amount all cotton must be manufactured before it is consumed. With the exception of the southern United States and Bombay, India, no important cotton producing area is also an important cotton manufacturing area. Europe is the area of greatest concentration in manufacturing. Its annual consumption of cotton of all growths amounts to more than 10,000,000 bales; that of Asia is 7,300,000 bales; North America, 7,300,000 bales; and South America, 500,000 bales. Of the great raw cotton consuming countries the United States, India and China use mostly home grown cotton; the great textile manufacturing nations of Europe receive the majority of their supplies from the United States, India and Egypt; while Japan secures over 95 percent of its supply from India, the United States and China.

Transportation costs are a minor item in locating the world's cotton manufacturing industry. Those countries with water transportation have some advantage. For example, the railway

* Wherever blanks appear in the table data are not available. Acreage for Brazil in the first column is an average for three years and for Peru an average for the period 1914-15 to 1918. 10 Production figures are given in bales of 48 lbs. net. Production figures for China are estimated by the United States Bureau of the Census, and those for Persia come from an unofficial source and are based on exports. The total production figures for the world are also estimates. The production figures for 1928-29 for Brazil, Peru and Argentina are unofficial.

Source. Adapted from United States, Department of Agriculture, Yearbook for 1930, tables 129 and 130.

freight rate from Dallas, Texas, to Houston is 81 cents per 100 pounds, and yet the same cotton is sent from Houston to Europe for 40 cents per 100 pounds. Lack of good transportation facilities in some of the newer cotton growing areas, such as those in central Africa and South America, has, however, been an important factor in limiting expansion.

The cotton plant deteriorates rapidly on poor soil and under bad cultural methods. Varieties mix readily and frequently produce sports. The result is a widespread activity on the part of private firms and governmental agencies in cotton improvement by selection and breeding. In the United States the government participates through federal and state experiment

stations which breed new varieties and test old ones. The business of commercial seed production and distribution is in the hands of private firms. In Egypt the government is taking the initiative in improving the quality of seed planted by operating very large farms. The seed thus grown is distributed to certain large farmers who in turn distribute to the small farmers. The seed is all controlled by the government. Through the efforts of the British Cotton Growing Association the Indian government is compelling the planting of particular varieties in certain areas and is making provision for supplying the seed. Russia likewise attempts to regulate the variety and quality of seed planted.

Cotton production has required a great deal of unskilled hand labor. Some phases of the work may be carried on in each month of the year. It is well adapted to production with forced labor on a large scale; it is also adapted to cultivation in small holdings, even by cultivators whose poverty and ignorance keep them in a position of virtual serfdom. The vast majority of the cotton growing area of the United States prior to 1861 was developed with slave labor. Cotton plantations, although varying in size, averaged 273 acres in 1850. They were typically owned by a resident landowner whose overseer managed the work of the plantation and directed and disciplined a number of Negro slave laborers. Agricultural efficiency was low; methods were relatively primitive. Profits instead of being used to improve the land were generally spent for new fields and slaves. Most of the crop was sold to factors who shipped it to Europe or the North. Cotton growing dominated the economic, social and political life of the southern states. It was the basis of a civilization which only fell before the rival industrial system of the North in 1865.

The freeing of the slaves broke up a number of plantations, but in many instances the slave became a tenant or share cropper under the supervision of the landowner. The census counts these as farmers and the few acres they cultivate as farms. In 1910, for example, 65 percent of the farms in Mississippi were under fifty acres, with 41 percent from twenty to forty-nine acres. In Egypt the average holding of the cotton cultivator is much less than in the United States; in 1920 the average holding of cultivated land was three acres and 65 percent of the holders were proprietors of less than one acre. Likewise in India the holdings are very small; they average from about eight acres in some provinces to less than half an acre in others.

Most of the cotton farms in the United States are operated by tenants or share croppers. The latter are generally supplied with land, house, tools, a draft animal and seed by the owner and in return must give him a large proportion of the crop. The standard of living of both groups is as a whole extremely low. Many croppers and tenants cultivate cotton almost exclusively; many do not have chickens, a garden or a cow. A study of almost a thousand families of cotton growers in Texas in 1925, for example, indicated that housing was poor and congested, the quality of diet low, mortality and morbidity rates high, that more than half of the mothers worked in the fields and that children became workers when very young. Three quarters of the children between the ages of six and sixteen in the families studied were working; over a third of them started to work when they were six or seven. The meagerness of the living which cotton growing affords the vast majority of its small farmers and laborers in the United States as well as in the rest of the world is notorious.

There are two peak labor loads in the producing of cotton. One comes in the spring when cotton must be thinned. The other peak load comes in the fall at harvest and is the more prolonged and intense. Picking is done by hand. In the cotton growing states of the United States thousands of laborers go out from the towns and cities to work through these periods along with the farmers and their families. In the southwest, particularly in Texas and Oklahoma, this seasonal labor supply is supplemented by thousands of itinerant laborers from Mexico.

Although cotton culture in the United States is undertaken primarily on a small scale by unskilled labor with the aid of mules and relatively simple implements, modern agricultural methods and machinery are beginning to appear. Planting and tillage machinery is being rapidly introduced west of the Mississippi. As a rule this means much larger farms, lower costs, more operating capital and more intelligent management and labor. More intelligent operation is likewise required, if a profit is to be secured, where the decline in yield is due to soil erosion and depletion and insects. The size of cotton farms is increasing more rapidly in the United States than in any other part of the world.

In addition to the development of modern planting and tillage machinery much money and effort have been expended in order to devise a mechanical harvester. At present cotton is harvested almost entirely by hand. The amount

picked in a day depends on the skill of the individual workers, the yield per acre and the variety of cotton. In the United States a fair picker gets from 150 to 200 pounds a day. In India he picks less than 50 pounds a day. None of the experimental mechanical harvesters can be called a success, although substantial progress has been made in Texas and Oklahoma, where conditions are most favorable. If these machines become established successes, as many expect will soon be the case, they will undoubtedly become the basis of vast changes in the social and economic organization of the cotton growing world.

Cotton requires a long growing season, hot weather, considerable moisture, a rich soil and clean cultivation. The stalk has a small root system and the cotton plant takes relatively little fertility out of the soil. On the other hand, the heavy rains make erosion a serious menace in most cotton growing countries, which depend on rains for moisture. The trend in the yield per acre of lint cotton in the United States since 1900 is downward at the rate of about a half pound per year, and in Texas and Oklahoma it is declining faster, chiefly because of erosion. Yield per acre is also greatly affected by insect pests and fungus diseases. The insects which do the most damage are the Mexican boll weevil in the United States and Mexico and the pink boll worm in India, Africa, South America and Mexico. In addition to these there are a large number of insects which do more or less damage to the cotton crop, such as the cotton leaf worm, cotton red spider, cotton stainer and the cotton flea hopper. The fungus and bacterial diseases are not as destructive as insects, yet they take a considerable toll. Important among these are cotton wilt, cotton anthracnose and the Texas root rot. Climatic factors cause even more damage than insects and plant diseases. The boll weevil entered Texas from Mexico in 1892 and from there steadily marched across the country, invading Louisiana in 1903, Alabama in 1909, Georgia in 1915 and North Carolina in 1918. It caused tremendous damage and virtually ruined hundreds of farmers. Varieties of late maturing cotton, such as sea island, were practically obliterated. Methods were gradually developed to combat the pest. The most successful have been: dusting the plants with calcium arsenate, early planting of rapidly maturing cotton which ripens before too many boll weevils have had time to breed, destroying the plants in the fall by fire and plowing, and accelerating the

rate of growth of the cotton through careful cultivation. The damage caused by the boll weevil reached a high point around 1920. Since then it has considerably diminished, although it is estimated that the weevil still destroys over \$200,000,000 worth of cotton a year.

The cotton farmers receive their income once a year. The portion of the year during which the farmers are on a cash basis depends on the size of their crops and the prices received. Ordinarily they make their arrangements for credit in January, February and March. In a large percentage of the instances the volume of the loans is such that the creditor practically controls the sale of the cotton. The loans are secured either by a chattel mortgage on the crop or an endorsed note. In a large part of the cotton belt of the United States the credit is supplied by the local store from which the farmer buys his supplies. This generally means high interest rates and high prices for supplies. It also practically forces the debtor farmer to continue growing cotton because it is the easiest crop for the creditor storekeeper to turn into cash. In its extreme form this credit system is peonage. In certain places part of the financing is done by banks, especially in the western part of the belt. The situation has also been improved by co-operatives in some instances. Some progress has been made in India toward the establishment of cooperative credit for crop production, but the bulk of credit is furnished by the local money lender.

As soon as the cotton is picked it is hauled to the gin where the lint is separated from the seed. The lint is put into bales protected by jute canvas and held together by steel bands. The average weight of bales differs in different countries. In the United States the average weight of the square bale is about 500 pounds gross, in Egypt about 750 pounds and in India 400 pounds gross. There were 14,974 active ginneries in the United States during 1928. Most of them are operated for profit by small local ginners scattered over the cotton belt. Others are operated by cottonseed oil mills; some by large planters. In recent years cooperative ginneries have appeared. Prior to the Civil War the ginney was a part of the plantation equipment; power was supplied by horses and mules. This primitive equipment has been replaced by steam and electric driven ginneries, many of which are largely automatic. Many ginners, instead of returning the seed as well as the lint to the farmer after ginning, purchase it

and sell it to the oil mills. Some states have legislated against this practise because selling to the ginner was believed to lower the price the farmer receives for his seed. Cotton is baled loosely at the ginneries to permit sampling by buyers. The bales are later compressed at plants which are generally connected with warehouses in the more important country towns. In India there were 1940 ginning and pressing factories in 1919, and in most districts these factories have formed pools which resulted in forcing up the rates charged the grower. A considerable amount of cotton is still ginned by hand in India. Ginning and haling in Egypt are practically all concentrated along with merchandising and exporting in a few large commercial houses.

The derivatives of the cotton seed have become important by-products of cotton growing. At the beginning of the Civil War the seed was generally considered practically worthless. Thrifty farmers plowed it down as fertilizer. The commercial value of crude cottonseed products has increased from \$2,530,000 in 1875 to \$265,247,000 in 1929. During the years from 1925 to 1928 the financial returns which farmers received for their seed equaled on an average about 15 percent of their income from cotton lint. There were only seven cottonseed oil mills in the United States in 1861; there were 547 such establishments, employing 18,434 men, in 1927. The United States produces over two fifths of the world's cottonseed.

The principal cottonseed by-products are oil, cake and meal, hulls and linters. The most important uses of the oil are for lard substitutes, other food products and soap. The cake, meal and hulls are used mostly for animal feed, although the meal was formerly used as fertilizer.

Linters are the fuzz and short stubby fibers that cling to the seed after the lint has been removed. They are used primarily for absorbent cotton, stuffing and cellulose products.

The value of cotton (lint) is determined by its class. The class is determined by grade (the amount of foreign material in it), its staple length (length of the bulk of the fibers composing the sample), its color and its character (including such things as uniformity in length and strength of fiber). There are standard types to represent the grades and colors of all the important growths of the world. In the case of American upland cotton these standards are uniform by international agreement. Types representing standards for staple length are available for American cotton only.

Staple length is the most significant factor governing the value of cotton. The world's cotton crops are usually divided into three groups: short cotton, equal to about 30 percent of the crop, grown chiefly in India, China and the United States; medium staple, which equals about 60 percent of the crop and is grown mostly in the United States, Mexico, Brazil, India and Russia; and long staple, which equals 10 percent and is grown in Egypt, the United States, Brazil, Sudan, Peru and the West Indies.

The gap between the spinner and the cotton grower is spanned by a highly organized system of marketing. Although the physical movement of cotton must necessarily proceed from the farm, the marketing process is initiated with the spinners, and the farmer is the last link in the chain in so far as market transactions are concerned. Cotton is customarily sold to spinners by cotton merchants on call for forward delivery. Often a considerable amount of cotton is sold by merchants to the spinners on call before it is planted. Some of the large cotton merchant firms sell direct to spinners, although in most instances they sell to spinners' buying brokers.

When grouped according to services performed cotton markets may be classed as spinners' markets, futures markets, centralizing spot markets and local markets. A spinners' market is one in which the merchants or their representatives meet and trade with the spinners or their representatives. These markets are located in centers of cotton manufacture, such as Boston and Charlotte in the United States and Manchester in England. They may be formally organized, although often they are not. In the latter case they adopt the rules of some other market, such as New Orleans, Bremen or Liverpool, for settling disputes. Futures markets trade in a basis contract, which calls for a specific grade of cotton but which gives the seller the option of delivering other specified grades at the maturity of the contract at differences determined according to the rules. They are the most highly organized of all the cotton markets. There are nine cotton futures markets in the world: New York, New Orleans, Chicago, Liverpool, Havre, Bremen, Alexandria, Bombay and Osaka. The contracts of the first six are based on American upland cotton. The futures markets establish the price level for cotton and make hedging possible. The centralizing spot markets are the great cotton reservoirs. The big spot cotton merchants make these markets and their major activities are carried on in them. The

cotton they sell to spinners is accumulated and classed for delivery in them. The cotton the merchants buy in the local markets is sent into these markets to be classed, stored and financed. Markets like Dallas, Houston, Memphis and Savannah are typical.

The local or country market is one in which the cotton merchant's representative meets and trades with the farmers for the cotton. There is such a market in the United States at almost every gin and small town in the cotton belt. Here the individual farmer, particularly if he is in debt and cannot hold his crop, is at a decided disadvantage in bargaining with the buyer. The local market is the weak point in the American cotton marketing system. Cotton classing is the work of an expert. The small volume of business in local markets does not make it profitable for the cotton merchant to put a skilled classer there and so he resorts to what is known as "point buying." This means that he pays a uniform price for all cotton in a particular local market. Thus the man who grows the best cotton is penalized and the ones who grow the poor cotton are given more than its real value. This tends to cause deterioration in the quality of the cotton.

The local market in India is even less efficient. There the grower sells to the local money lender before the cotton is ginned and sometimes before it is picked. The local buyers mix the various growths or they may even import cotton waste to mix with the cotton before it is ginned. The local buyers sell chiefly to merchants in Bombay, which is perhaps the largest spot cotton market in the world.

In Egypt the local markets are similar to those in India. The farmer usually sells his cotton in the seed to the local money lender or the ginner. He is in no position to bargain for the sale of his cotton on its merits. The local buyers sell to representatives of merchants in Alexandria. There are over fifty shippers of Egyptian cotton but only five firms which ship more than 40,000 bales each.

Cooperative marketing has been slow in making headway among cotton farmers. More has been done in the United States than elsewhere. The first efforts of significance were made by the National Grange in 1873. In 1908 the Farmers' Educational and Cooperative Union of America in the South adopted cooperative marketing as a major activity. It was interested primarily in local markets and built many local cooperative warehouses. After the World War a new movement was started with a much more

ambitious program. While it had a number of purposes, the predominant idea was to control a sufficient volume of cotton to influence price. It was proposed to market the cotton in central markets and to spinners. Twelve state wide associations were established, and these formed an overhead organization, the American Cotton Growers' Exchange, to secure united action. These organizations showed little tendency to increase cotton values after 1925, and the severe price declines of 1929-30 caught most of the associations with large holdings of cotton. The Federal Farm Board in 1930 devoted a large part of its time and money to the reorganization and strengthening of the cooperatives.

The price of cotton is made in two parts. The most important is the price of futures, which represents the price level or the approximate value of the standard grade of cotton. It is made in the futures market, into which hedging operations send all purchases and sales of spot cotton. The second part of the price is added to or subtracted from the price of the futures and is known as the "basis." It is made up of the difference between the value of a specified quality of spot cotton to be delivered and the value of the futures, plus transportation costs and the merchant's business expenses and profits. It is greatly affected by crop, manufacturing and market conditions. It is quoted in terms of points "on" or "off" specified active month futures in a named futures market for a named class of cotton delivered at a specific place. A merchant, for example, may quote strict middling inch cotton f.o.b. Boston to a spinner in July for September shipment at, for example, 250 points on October futures in the New York Cotton Exchange. In this case the "basis" or second part of the price is fixed at 250 "on" and the spinner has the right to name the time when the first or futures part of the price is to be fixed. Suppose he elects to fix it on August 15. In that case he wires the merchant to fix the price. If the merchant does not have the spot cotton with which to fill the contract he buys a futures contract and reports the price to the spinner. If it costs 14 cents, then the total price to the spinner is 16.50 cents, a point being one hundredth of a cent. If the merchant already had the cotton bought and hedged he would fix the price by the sale of a futures contract, and the price would be the same.

The price of the basis is made in the spot markets. Since the conservative merchant keeps completely hedged he makes his profit or loss

not in the rise or fall of the price level of cotton but in trading in the basis, which is his chief business.

The price of cotton varies widely from year to year, depending on the volume of supply and the world's business conditions. In 1923 the price of middling spot cotton in New Orleans reached 36 cents with an American crop of 10,140,000 bales. In 1926 the production was 17,977,000 bales and the low point in the price was 11.68 cents. In 1927 the crop was 12,955,000 bales and the price reached a high of 23.5 cents. The widely fluctuating yields, especially from farm to farm, render cotton growing an extremely hazardous business.

The cotton business is done in terms of time. This entails great risks, which stimulate efforts at price forecasting and estimating. The most important causes of price changes are changes in supply, changes in the general price level and changing demand. The market supply is made up of carryover plus forecasted crop within the range of futures. The wholesale price index gives the price level, and the ratio of the price of cotton to cotton yarn is a good index of the strength of demand. There are a number of statistical services which make cotton price estimates and forecasts.

Since the volume of American cotton is so large in comparison with that of other countries the price of it is a very important factor in determining the price of other growths. The production of cotton in the countries growing the minor crops is even more hazardous than that in the United States. A low price in the United States is a result of large yields which partly compensate for low price; but if India, Russia or some other country has a short crop at the time the United States has a large one, the former countries will have both a low yield and a low price.

COTTON, JOHN (1585-1652), Puritan clergyman and theologian. As an undergraduate at Trinity College, Cambridge, and later as fellow of Emmanuel College, which at that time was the stronghold of Puritanism, Cotton was deeply influenced by the Puritan movement and the doctrines of Calvinism. His introduction of Puritan reforms into the ritual of St. Botolph's Church, Boston, England, of which he was vicar from 1612 to 1633, finally brought upon him such extreme interference from the religious authorities of England that he was forced to flee to the Massachusetts Bay Colony. His renown as a Biblical scholar and eloquent interpreter of the Scriptures led to his immediate appointment as "teacher" in John Wilson's church in Boston, where during the next twenty years he was

one of the most influential preachers and statesmen among the pioneers, taking an active part in all the major ecclesiastical and political conflicts in the colony.

Being a Puritan, not a Separatist, he maintained the doctrine that the Congregational churches, having purified themselves of "the inventions of men," should continue to be established by law and should constitute a theocracy. By insisting with Anne Hutchinson on an explicit regeneration (called the Covenant of Grace) as a basis for church membership and confining political privileges to church members he attempted a more rigorous version of theocracy than did the majority of his fellow ministers and freemen. He attempted repeatedly to uphold the authority of the magistrates in the face of demands made by the freemen, but in the end he was compelled to yield. He was also compelled to modify his doctrine of the Covenant of Grace when Anne Hutchinson carried it to extremes. He took for granted, as did his fellow Puritans, that democracy is "the meanest and worst of all forms of government"; and he defended theocratic intolerance against Roger Williams, who believed that civil authority should extend only to men's bodies, not their souls. Cotton held that the state, although in theory a separate society with clearly defined functions, was in practise an agency for maintaining the moral discipline established by the church and the law of God.

The demands on the part of certain elements in the colony for a definite body of laws led Cotton to outline a rigorous, almost Mosaic, constitution and penal code, dubbed by Winthrop "Moses, his Judicials." Although it failed of adoption in Massachusetts it served as the basis for the frame of government of the colony of New Haven, of which Cotton's friend, John Davenport, was cofounder. Cotton's draft for the Cambridge Platform in 1648 was not accepted, but he wrote the preface for the slightly less strict draft of Richard Mather which was adopted. His catechism, *Milk for Babes* (London 1646), was widely used until it was supplanted by the Westminster *Shorter Catechism*.

To his contemporaries his fame rested less on his defense of theocracy than on his defense of Congregationalism. He defended the rights of independent churches against both Presbyterians and Anglicans, and in spite of his anti-democratic sentiments he provided in his defense of the Congregational covenant an argument which was widely and effectively used by

later champions of democracy. Congregational theology is expounded in his three treatises, which had a great influence in England: *The Way of the Churches of Christ in New England* (London 1645); *The Keyes of the Kingdom of Heaven* (London 1644); and *The Way of Congregational Churches Cleared* (London 1648).

COUNCIL OF THE INDIES (Consejo de Indias) was the administrative body through which the Spanish crown for several centuries governed its vast overseas possessions. It owed its separate and legal existence to a decree of Charles V of August 1, 1524. In the beginning, from the time of Columbus' second voyage in 1493, affairs of the "Indies" were entrusted to Juan Rodríguez de Fonseca (1451-1524), member of the Council of Castile, assisted after 1501 by a secretary for colonial affairs. In 1503 the Casa de Contratación (*g.r.*) was established and from 1510 there was a special committee, or Junta de Indias, consisting of five and later seven members of the Council of Castile, presided over by Fonseca. But with the conquest of the mainland territory of New Spain by Cortés and the increased burden of administrative business the creation of a separate tribunal became necessary; for this the death of Fonseca provided a convenient occasion.

Its personnel at first consisted of a president, five or more councilors (*letrados*, men trained in civil law), two secretaries, a crown attorney (*fiscal*) and a reader or reporter. In 1528 a grand chancellor and his deputy were appointed. Other officials were added from time to time during the next hundred years: a treasurer, four ac-

countants, two attorney's assistants, a lawyer and a solicitor for poor suitors, two additional reporters, a chaplain, a notary, several ushers and a bailiff. The number of secretaries varied from two to four but was finally fixed at two, one for the viceroyalty of New Spain, the other for the viceroyalty of Peru. In 1571 was created the post of historian and cosmographer, twenty years later divided between two individuals, and in 1595 was added a professor of mathematics. Councilors chosen were preferably men who had filled important offices in the Indies, such as former viceroys, governors and judges, so that the benefit of their experience and advice might be had.

Under the Hapsburg kings the Indies were held to belong to the crown of Castile to the exclusion of Aragon, for it was under the auspices of Queen Isabella that they had first been discovered and explored. Consequently the laws and institutions of Spanish America were modeled on those of Castile, although changes in form and function developed to meet local needs. Moreover, in Castile on the ruins of baronial anarchy the Catholic kings and their successors created a royal absolutism, which in the New World found a field free from the traditions and inhibitions of an Old World society. The Indies therefore were treated as the direct and absolute possession of the king. They did not belong to Spain or even to Castile as such. Mexico and Peru were kingdoms, combined with the kingdoms of Spain under a common sovereign, bound together only by a dynastic tie. This theory was lost sight of in the eighteenth century under the Bourbon dynasty, but it was reasserted by the colonists to justify their demands for political autonomy.

The Council of the Indies, therefore, was a *real y supremo consejo*, independent of, and coordinate with, the other royal councils. It had the same jurisdiction over Spanish communities in America and the Philippines as was possessed within the Spanish peninsula by the Council of Castile, a body which had been brought to its high state of importance by Ferdinand and Isabella and which formed a model that the Spaniards tended to follow when devising governmental organs for such great divisions of their empire as Aragon, Italy and the Netherlands. The competence of the Council of the Indies extended to every sphere of government: legislative, financial, judicial, military, ecclesiastical and commercial. The king was absolute lord of the Indies and the council was his

mouthpiece. It resided at the court and its deliberations were secret.

All laws and ordinances relating to the administration, taxation and police of the American dominions were prepared and dispatched by the council with the approval of the king and in his name, and no important local scheme of government or of colonial expenditure might be put into operation by American officials unless first submitted to it for consideration and approval. In consultation with the crown it traced the territorial divisions of the American empire. It proposed the names of colonial officials whose appointment was reserved to the king, and to it all such officers were ultimately accountable. It corresponded with the authorities in the New World, lay and ecclesiastical, and kept jealous watch over their conduct. Since by early papal bulls the tithes and the patronage of the church in America were reserved to the crown of Castile, the supervision of ecclesiastical matters also fell within the council's jurisdiction. Nominations to all important benefices were made in this tribunal, and no papal letters or decrees might be published in America without its exequatur. With respect to the Spanish Inquisition and its agents, however, the council was far from enjoying undisputed supremacy.

In its judicial capacity the council sat as a court of last resort in important civil suits appealed from the colonial audiencias and in civil and criminal cases from the judicial chamber of the Casa de Contratación. Reserved to it were all other cases arising in Spain and concerned with the Indies, as were all matters relating to *encomiendas* of Indians. Supervision of the interests of the aborigines was indeed one of its special concerns, for their conversion and civilizing were always regarded as the crown's peculiar responsibility. The council also made arrangements for the *residencia* (judicial review of an official's conduct at the end of his term of office) of viceroys, governors, judges and other important colonial officers. From time to time it sent to the Indies inspectors general (*visitadores*) to investigate every phase of colonial life and administration and report back to the council. In the sixteenth century it audited the accounts of colonial treasurers and comptrollers of the exchequer. But, owing to distance and to the difficulty of securing a regular remission of accounts, the establishment of courts of audit (*tribunales de cuentas*) at Lima, Mexico and Santa Fé de Bogotá, from whose decisions there was no appeal, was ordered in 1605.

Like most Spanish councils the Council of the Indies was a hard working body. It was required to meet from three to five hours every day except holidays, three councilors constituting a quorum. Important matters were decided by the council as a whole; minor questions were assigned to smaller committees by the president. From 1601 to 1609 and after 1644 there was a permanent committee for all matters of royal favor and patronage called the Consejo or Junta de Cámara de Indias. Military and naval affairs after 1597 were reserved to a Junta de Guerra de Indias consisting usually of four councilors of the Indies and four from the Consejo de Guerra of Castile. It nominated important naval and military officers in the fleets and in America and also those charged with the expenditure of naval and military funds.

Powers of censorship were also exercised by the council. No book treating of the Indies could be printed in Spain or the colonies without its previous inspection, approbation and license, and no such book could be introduced into the Indies without its express permission.

Although the principles and ideas behind colonial administration doubtless emanated from the crown, especially in the formative period of the sixteenth century, the influence of the Council of the Indies upon legislation must have been considerable. But an institution such as this, responsible collectively to an autocratic king, possessed the defects inherent in a conciliar system of government: on the one hand, absence of individual responsibility; on the other, growth of a spirit of routine which paralyzed procedure and made rapidity of decision and action difficult. Like other councils of Hapsburg Spain it deliberated interminably. Matters were referred to the king, from the king back to the council and to the king again. There were instructions after instructions, memorials upon memorials and endless accumulation of documents, useful as preserving precedents and enlightening to the modern historical investigator but serving only to clog the wheels of government.

Under a paternalistic monarchy legislation for the Indies soon became very voluminous, touching every aspect of the duties, rights and responsibilities of the colonists and of the officials set to rule over them. Much of it in time became obsolete or contradictory. More than a century of effort to compile and systematize it resulted eventually in the promulgation on May 18, 1680, of the *Recopilación de leyes de los reynos de las Indias* (4 vols., Madrid 1681; 5th ed. 2 vols.,

1841). This famous code, in spite of defects visible to the wider experience of a later day and in spite of the restrictive, paternalistic spirit which dictated it, is a notable monument of colonial legislation. Its shortcomings were chiefly those common to the colonial policy of most European nations in that age. At least it did not, according to recent investigators, prevent the growth of customary law in the overseas territories, in which considerable elements of aboriginal law are to be found.

When Bourbon princes came to occupy the Spanish throne from the beginning of the eighteenth century they brought with them the administrative experience and practices of France, and in the course of time many innovations were introduced into the political organization of the state. Cabinet ministers were appointed, among them a minister of marine and Indies in November, 1714. To the latter were transferred all matters relating to war, finance, navigation and commerce, and the nomination of all but purely political and judicial officers, including members of the Council of the Indies and of the Casa de Contratación. By a decree of July 8, 1787, a second minister of the Indies was appointed with jurisdiction over patronage and justice; but three years later, in April, 1790, the two portfolios were suppressed and their functions distributed among five ministers who presided over the respective departments of government for the peninsula: foreign affairs, war, marine, justice and finance. The older Hapsburg theory of the relation between the crown and its American possessions was forgotten or ignored.

The council, however, continued to serve in an advisory capacity to the king, shorn of many of its former powers but proud of its traditions. Several changes in its organization and prerogatives were introduced in the reign of Charles III, notably by decrees of 1773 and 1776, which divided it into three chambers—two of government (one for Mexico, the other for South America) and one of justice—and increased the number of councilors to fourteen. The Cortes of Cádiz, in which natives of America participated, abolished the council along with the other old councils and tribunals, by a decree of April 17, 1812. It was reestablished by Ferdinand VII after his restoration in 1814. After the loss of the major part of the Spanish American Empire it was abolished by a law of March 24, 1834. There existed, however, from 1851 to 1854, a Consejo de Ultramar.

To a certain extent the type of colonial gov-

ernment embodied in the Council of the Indies was applied to the rule of the Portuguese colonies during the union of that country with Spain. The establishment in 1591 of a Council of Finance divided into four sections for the government of Portugal and its domains was followed by the creation in 1604 of a Council of the Indies which shared the government of the colonies with the Council of Finance. Although this body possessed many of the powers of its Spanish model, for various reasons it never enjoyed as much authority as the latter. Nevertheless, many features of the Spanish regime did not fail to survive the restoration of 1640.

COUNTRY LIFE MOVEMENT. This term is used to designate a widely varied group of organized activities which have as their main concern the cultural and social welfare of the

rural population. The conditions which have called it forth are a product of the past century, but the movement has grown to importance only within the last twenty-five years. Within that time vague sentiments of concern for the rural population and unrest among farmers and country dwellers have crystallized into definite programs for action or study. It is still true, however, as Dean L. H. Bailey, chairman of the Roosevelt Commission on Country Life, said in 1909, that the country life movement "is not an organized movement proceeding from one center or even an expression of one set of ideas. It is a world-motive to even up society as between country and city."

Through the many generations during which the rural segment of society approximated economic and social self-sufficiency there was little possibility or necessity for special consideration of the social aspects of rural life. The industrial revolution brought with it, however, a sharp demarcation between the urban and the rural dweller, while the agrarian revolution with its scientific and machine efficiency led to the commercialization of agriculture. Agriculture ceased to be a way of life and became a method of business enterprise. The standard of living of the farm family automatically came to be conditioned by market prices for farm products and money profits on the farm enterprise. In the meantime, methods of transportation and communication had developed to a point where the farm population was thoroughly aware of the manner of life of city populations. The social and intellectual as well as economic inadequacies of modern country life, apparent in a conscious comparison and competition of urban and rural standards of living, were manifested by the drift of rural populations to urban centers. A steady movement to the city had been taking place in all western civilization ever since the advent of the industrial revolution, but it became pronounced in the United States only when the limits of the frontier were reached and the tide of population turned back on itself. The belief spread that the drift to the city was leaving a decadent civilization in the rural areas. It was as an outcome of governmental as well as private concern over these alarming tendencies that the country life movement developed. In the United States the sentiments and ideas which had been fostered for two generations in the large farmers' organizations such as the Grange, the Farmers' Alliance and the Farmers' Union gave added impetus to the demand for improvement.

The first organized expression of the movement came in the United States in 1908, when President Roosevelt appointed a Commission on Country Life and charged it with the responsibility of discovering if possible the weak spots in American rural life and their remedies. In his message to the United States Senate and House of Representatives on February 9, 1909, he said: "The object of the Commission on Country Life, therefore, is not to help the farmer raise better crops, but to call his attention to the opportunities for better business and better living on the farm." He opened the concluding paragraph of his message with the following words: "I warn my countrymen that the great recent progress made in city life is not a full measure of our civilization; for our civilization rests, at bottom, on the wholeness, the attractiveness, and the completeness, as well as the prosperity, of life in the country."

The report of the Roosevelt Commission on Country Life was made in January, 1909. It reviewed the most prominent deficiencies in rural life and encouraged the formation of a variety of voluntary organizations to give greater vitality and greater stability to country life.

This report stimulated popular and academic concern in the problem and gave rise to a series of studies and investigations of country life. About the same time, the movement derived considerable new impetus from the development and spread of general interest in a recognized technique of social work. Moreover, the sociologists, and especially those concerned with community life and organization, had begun to realize that rural attitudes and rural institutions presented an important field of study. Intelligent analysis has revealed distinct culture patterns of the country which cannot be recast into a city mold but require a fair chance to achieve independent fruition. Ten years after the publication of the report of the Roosevelt commission the National Country Life Conference was formed in Baltimore, Maryland, at a meeting of the leaders of social agencies and institutions working in rural areas. This conference has become a centralizing agency within the movement. Since its formation it has held annual meetings, at each of which a single topic has been discussed and an attempt made to mobilize information, discussion and opinion on the problem at issue. At the second meeting of the conference, held in November, 1919, rural health was the topic of discussion. The wide range of interests is indicated by the subsequent

topics of the annual programs: rural organization, town and country relations, country community education, the rural home, religion in country life, needed adjustments in rural life, farm youth, farm incomes and rural progress and urban-rural relations. The association has had a full time executive secretary for the past eight years and in addition to its annual proceedings publishes in New York the magazine *Rural America*, which now appears ten times each year. The association fosters state and regional country life conferences and now plans to sponsor a National Rural Forum on agricultural issues and policies. A National Council of Rural Social Agencies has also been formed recently to coordinate the work of the various bodies doing actual work in rural areas.

There have been various other manifestations of an interest in country life in the United States during the last half century. Increasing numbers of magazines and periodical articles have been devoted to rural living, and many realistic novels, semipopular and semiscientific books on the changing conditions of rural existence have appeared. Membership has increased yearly in the great general farmers' organizations and farmers' cooperatives, many of which emphasize the social and intellectual as well as the economic side of farm life. Rural sociology has found an increasingly important place in the curricula of American colleges and universities, with approximately six hundred persons now teaching such courses; and approximately \$100,000 per year is being expended in rural social research.

The country life movements of European countries have started with quite different premises and problems than those of the United States. Rural society in Europe has had traditions as old as, and until very recently stronger than, urban traditions. The definite class structure of European society soon made agriculturalists seek to improve their conditions through association. The peasants' and farmers' organizations which multiplied so rapidly in most of the European countries during the nineteenth century concerned themselves with all aspects of living—economic, social, intellectual and moral. Thus there was for a long time no place for a country life movement such as that in the United States, organized for the most part by semipopular associations and teaching agencies. With the increasing drift of population to the city, governments in Europe also became concerned with the status of rural life, and about 1910 there was considerable interest in the re-

Country Life Movement—County-City Consolidation 499

vival of folk life and folk arts in a number of European countries; but the most effective activity has been the encouragement of existing cooperative organizations. Denmark and Ireland are outstanding examples of the remaking of rural life through such cooperative movements. Since the war an increased interest of outside groups in rural social welfare has been manifested. The Women's Institute in England, founded in 1915, constitutes a country life movement similar in aims to that of the United States. It has fostered the organization of community clubs and organizations all over England. In no European country has the formulation of rural sociology or the promotion of research and investigations in the field of rural social life developed to any extent. But there are indications of an increasing development and application of social work and community organization techniques to rural problems in many of the European countries.

These developments have been of sufficient force to result in the organization of an International Country Life Conference, the first meeting of which was held in Brussels, Belgium, in July, 1926, the second at East Lansing, Michigan, in August, 1927, and the third at Budapest in June, 1929. Thirteen countries were represented in the first conference, twenty-five in the second and nine at the third. The objects of this international organization are the exchange of information and views between the rural improvement agencies of the different nations and the encouragement of such agencies throughout the world.

COUNTY AGENT. See EXTENSION WORK, AGRICULTURAL.

COUNTY-CITY CONSOLIDATION. An important problem of local government, especially in the large metropolitan communities, is that of the relation between the governments of the city and the county. Where a large city contains much the greater part of the population of the county in which it is located there is duplication of governmental machinery and an overlapping of functions, causing waste and opening the way to conflict of authority. The cumbersome system of county government becomes more complex in counties containing large cities; and in elections for both city and county offices candidates for the latter are likely to receive very scant attention. The problem is more acute where the metropolitan area and the political limits of the city do not coincide. In such cases the city is hampered in the performance of its proper functions. City police are unable to control the suburban areas, which in the case of many large American cities become havens for gamblers, bootleggers and other undesirables. The acquisition of wooded tracts for city parks, the extension of fire protection, the proper planning of building zones and traffic highways, all require control or cooperation over an area larger than that contained within the political limits of the city.

To meet these problems consolidated county-city governments have been established both in the United States and in other countries. In Prussia cities of over 25,000 population are constituted as "circles"—local districts corresponding in some degree to the American counties. In England the larger boroughs (until recently all over 50,000 population) are classed as county boroughs and vested with the powers of county councils as well as those of boroughs. In the United States some measure of county-city consolidation has been established in a number of the larger cities, including New York, Philadelphia, Baltimore, Boston, St. Louis, Denver, New Orleans and San Francisco. As in England, cities in Virginia are automatically removed from the control of the county authorities. In other places the problem has been under active consideration in recent years and various plans have been proposed for its solution.

New York City and county covered the same area from early colonial days. The city was extended in 1898 to include four counties, and a fifth has since been created by the division of New York county. County and city functions have been merged to some extent—in financial administration, local charities, public works and

ordinance powers. But each county elects certain officers prescribed by the constitution, mainly for the administration of justice. Each county also constitutes a borough, with an elected borough president in charge of some local municipal activities. The city of Baltimore was separated from Baltimore county in 1851, and the city has in effect the legal status and powers of a county. In 1854 the city limits of Philadelphia were extended to include the entire county of Philadelphia. Some county offices (those of commissioners, treasurer and auditors) have been discontinued, but other officials connected with the judicial courts (judges, clerks, district attorney, coroner and recorders) continue as elective officers. A consolidated government for the city and county of San Francisco was established in 1856, and the plan of government has since been altered and somewhat simplified. A board of supervisors serves as both county board and city council, and one set of finance officials (assessor, tax collector, treasurer and auditor) acts in both county and city affairs. There are duplicate legal and law enforcement agencies, however, with separate district and city attorneys, sheriff and city police. The city of St. Louis was separated from the county of the same name in 1876 and a combined city-county government established for the city. Some county offices were discontinued, including the county fiscal court. The new system seems to have secured substantial results in economy and efficiency. But with the growth of the community beyond the boundaries of the city new difficulties have arisen and thus far efforts to extend the area of the city have failed. Boston includes nearly the whole of Suffolk county, and there has been some consolidation of city and county agencies. The mayor and council of the city have the powers of a county board, and the finance officials of the city (treasurer and auditor) act also as county officers. There are, however, a number of elective county offices. By an amendment to the Colorado constitution adopted in 1902 Denver was separated from the county of Arapahoe and established as a consolidated city and county. A home rule charter was adopted, with a simplified form of government eliminating duplication of officers and functions. Consolidation was delayed by legal proceedings for nearly ten years but has now been more completely carried out than in other American cities.

County-city consolidation, even when only partial, appears to have brought about increased

efficiency and financial economy. But in most cases the consolidation is by no means complete and new difficulties have arisen as the combined city-county overflows its boundaries.

Several state constitutions have provisions authorizing county-city consolidation. The Missouri and Michigan constitutions authorize cities of over 100,000 population to be organized as separate counties, the Minnesota constitution has a similar provision for cities of over 20,000 population and the California constitution provides for the consolidation of city and county governments. Constitutional amendments authorizing county-city consolidation were adopted in Montana in 1922 and Georgia in 1924. Efforts to secure a similar amendment in Ohio in 1919 were not successful. But no instances of county-city consolidation other than those already noted have been carried out under these provisions. Active efforts have been made in several places, including Alameda county, California, Multnomah county (Portland), Oregon, and Silver Bow county (Butte), Montana. In Pennsylvania a constitutional amendment was adopted in 1928 authorizing a federated system of local government for Allegheny county, including the city of Pittsburgh, and a charter to make this effective has been prepared for submission to popular vote.

Opposition to the consolidation of city and county government comes in part from the residents of the suburban and rural portions of the county, who fear a higher tax rate, and in part from the political officeholders, who fear the loss of their positions. Poor municipal government strengthens the position of those who object to absorption in the larger organization. A federal system of organization, as in London and Berlin, with some autonomy for local districts seems to offer better prospects for success than a completely centralized system. Other difficulties arise from the need of securing enabling legislation. Often the state constitution must be amended. The growing practise of submitting consolidation proposals to a referendum in the areas concerned increases the difficulty. Financial and technical problems necessitate careful study before a satisfactory adjustment can be reached.

Other methods of dealing with particular problems of metropolitan regions are by the creation of special districts, such as the Metropolitan District of Massachusetts, the Port of New York Authority and the Sanitary District of Chicago; and by the voluntary cooperation of

various local authorities, as in regional planning for New York and Chicago.

A., and Kneier, C. M., *County Government and Administration* (New York 1930) ch. xviv.

COUNTY COUNCILS. The reform in county government brought about by the Local Government Act of 1888, which established the county councils for the first time, was at least fifty years overdue. So far back as 1835, when the frequently corrupt and degenerate borough councils were set in order by the Municipal Corporations Act, it was already clear that the justices of the peace, who at that time comprised the only important constitutional rulers of the county, were utterly unfit to carry on the administration of local government in the modern state.

Public opinion ran strongly against the county justices not merely on account of their general inefficiency and lack of integrity but also because of their biased and arbitrary attitude in regard to such matters as the administration of the game laws, the stopping up of footpaths and the restriction of public house liquor licenses. The immediate result of this criticism was the passing of legislation which removed from the jurisdiction of the justices, entirely or in part, certain important functions which they had previously exercised. Thus the Poor Law Amendment Act of 1834 placed the supervision of the poor law in the hands of the central government; and similar action was taken in regard to the prison service by the Prisons Act of 1835, the control of ale houses by the Licensing Act of 1828 and the control of lunatic asylums and to some extent action even in regard to police management by other statutes. The Factory Act of 1833 took away from the justices the power they had possessed for thirty years of inspecting cotton

factories and transferred the function to the Home Office inspectors.

The justices in quarter sessions were manifestly incapable of discharging the heterogeneous mass of legislative, judicial and administrative powers which had been conferred upon them since Tudor times. Yet strangely enough no attempt was made for nearly half a century to set up an adequate municipal structure to supersede them. The justices were regarded primarily as judicial authorities, and it is to this fact that their survival in the ensuing decades must be ascribed.

The Local Government Act of 1888 divided the country into administrative counties differing in various respects from the ancient or historic counties in all save one or two cases. Thus large ancient counties such as Yorkshire, Lincolnshire, Cambridgeshire, Hampshire, Northamptonshire, Suffolk and Sussex have been divided into two or three administrative counties each. On the other hand, various cities comprise parts of two or three ancient counties. The administrative county of London, for example, was created from parts of the three ancient counties of Middlesex, Surrey and Kent. Then again, the ancient counties include the county boroughs, large or important towns possessing the powers of both a borough and a county council, whereas under the act of 1888 each county borough is "an administrative county of itself." The ancient or historic counties are, as their name suggests, the oldest counties known to us. But they are no longer units of local government for any purpose whatsoever. The census of 1911 was the first taken on the basis of modern administrative counties, and since the Representation of the People Act of 1918 the ancient county has been abandoned even as an area for division into parliamentary constituencies.

The act of 1888 set up in each county a popularly elected council consisting of a chairman, aldermen and councillors. These county councils were entrusted with the management of the administrative and financial business of the county. The administrative business of the justices of the peace for the county in quarter sessions assembled was thus transferred to the county councils. The most important functions thus conferred were the maintenance of main roads and bridges, reformatory and industrial schools, asylums for pauper lunatics, the execution of the acts relating to animal disease, destructive insects, fish conservancy, weights and

measures and wild birds. The justices have been left with only two administrative functions: the issuance of licenses for the sale of liquor and a share in the administration of the police. The county police is under the control of a standing joint committee composed of an equal number of members chosen by the county council and the justices in quarter sessions. The judicial functions of the justices have not been affected.

Since 1888 a further mass of functions has been conferred on the county councils, especially with regard to education, health and charitable institutions, so that today they administer services of great diversity and magnitude. The Local Government Act of 1929 contained important reforms affecting the county councils. On its administrative side this statute abolished the boards of guardians and transferred all their powers, duties and property to the county councils and county borough councils. In this way the Poor Law after three centuries of separate existence has been woven into the general municipal structure. At the same time the act of 1929 has placed under the jurisdiction of the county councils practically the entire mass of highways, apart from those in the independent county boroughs and excluding a certain number of streets in minor towns. The act also confers extensive town planning powers on the county councils.

Despite this vast accumulation of powers, indeed to a large extent because of it, the county councils are beset with grave difficulties. These arise from two distinct sources. On the one hand, the county councils are not completely in command of county government because of the existence of minor authorities possessing independent or concurrent powers. Within the sixty-two administrative counties of England and Wales there are no less than 255 non-county borough councils, 783 urban district councils, 644 rural district councils and approximately 7200 parish councils and 5646 parish meetings. In every part of the county there are at least two and often three local governing authorities. Public health and education, to take two important examples, are divided between the county council and the county district council. The division is not based on any logical or coherent plan. Each council is independent and without power over the other. Both draw their revenue from a single source of taxation. The tendency in recent years has been for Parliament in passing new legislation to make exclusive use of the county councils in preference

to the smaller authorities. This has been strenuously resisted by the county district councils.

The county councils are engaged, on the other hand, in a bitter struggle with the large independent towns and cities—the county boroughs. This is due to the persistent efforts of non-county boroughs to secure promotion to county borough status and also to the continuous enlargement of boundaries achieved by existing county boroughs at the expense of the county councils. A non-county borough, although possessed of a directly elected borough council with extensive powers, is nevertheless within the area of the administrative county for purposes of taxation, and the county council administers many important services therein. When it attains county borough status it is completely severed from the surrounding administrative county for all local government purposes and becomes entirely independent of the county council.

The measure of success attained by the towns in this twofold movement may be judged by the fact that between the years 1889 and 1925 the number of county boroughs increased from sixty-one to eighty-two. The effect of this was to transfer 1,300,000 persons, 100,000 acres of land and £6,500,000 of ratable value from the counties to the county boroughs. During the same period there were 109 extensions of boundaries effected by county borough councils, which removed from the dominion of the county councils a population of 1,700,000 persons, 250,000 acres of territory and £8,000,000 of ratable value. The total losses to the counties involved by these changes were thus 3,000,000 citizens, 350,000 acres of land and nearly £15,000,000 of ratable value. This represents losses to the administrative counties of 8.55 percent of their ratable value and 8.92 percent of their population. A loss of prestige was also involved. The protests of the county councils resulted in the appointment of a Royal Commission on Local Government in 1923 to investigate this and other important questions. The recommendations of the commission have resulted in a change of procedure whereby all contested applications are decided by Parliament under the private bill procedure.

The counties vary widely in size, population, wealth and character. The boundaries of a county were often the limits of the jurisdiction of a feudal earl. The ancient counties, which form at least the basis of the administrative counties, appear to have reached some approximation to

their present extent and form before the Domesday Book was compiled about 1085; their boundaries were gradually defined in the centuries between the Angle and Saxon settlements and the middle of the eighteenth century. Their immense inequalities of area, population and wealth, their irregular and irrational boundary lines, the frequent disregard of natural configuration and economic frontiers, contribute in greater or less degree toward making many of the counties imperfect as areas of local government. Moreover, the progress of science, the extended sphere of public administration and improved means of communication have made even the best of the counties inadequate from the point of view of optimum efficiency. Such services as electricity supply, road transport, land drainage, higher education, town planning and the control of river pollution require not only much larger areas of operation, if the best results are to be obtained, but also areas expressly designed to meet the special needs of each function.

These facts, the importance of which has become accentuated with the passage of time, have given rise to a number of schemes of reform. In particular, mention may be made of the plan for great regional councils put forward by G. D. H. Cole and others; the system of municipal "cells" from which areas of any shape or size could be built up proposed by Sidney and Beatrice Webb; and the numerous suggestions made before the Royal Commission on London Government shortly after the war. The weakness of most of these schemes is that they involve the supersession of the county councils, which constitute one of the strongest political forces in the

London presents a special problem in itself, partly on account of its great size, partly on account of the stubborn vested interests and historic traditions which impede a settlement based only on considerations of good government. The area of the London County Council is manifestly inadequate to its task. It does not include the square mile of the so-called City—the wealthy commercial and financial heart of the British Empire—which is governed by the Corporation of the City of London. Nor does it include the vast dormitory areas which spread out for miles in every direction and which contain many thousands of residences for workers of all classes. These workers form a huge tidal wave of population which surges in and out of the city on every working day. Costly services have to be provided for this invading army dur-

ing the daytime by the London County Council or the metropolitan borough councils; but as their homes are outside the area they escape taxation in respect of these services.

The labors of the Royal Commission on London Government to find a solution for this problem were abortive, largely on account of the powerful opposition put forward by the surrounding authorities and the city corporation to the proposal for a comprehensive authority covering the entire area. But the difficulties of the present position continue. The achievements of the London County Council mark it out as the authority on which an increasing degree of responsibility must inevitably fall, whatever changes ensue.

The county councils follow the practise of all English local governing bodies of working by means of administrative committees, some of which are required by law, others of which are optional. These committees are nearly always appointed so as to represent the various groups on the council approximately in proportion to their strength. The principle of co-option is in some cases prohibited, in other cases permitted and in a few instances required by legislation.

There has been a strong tendency in recent years for local government in Great Britain to develop on party lines. This has been particularly noticeable since the rise of the Labour party. But up to the present party politics has penetrated less to the county councils than to any other type of municipal authority. This is due in part to the lack of popular enthusiasm shown toward county government and in part to the inability of the Labour party to find candidates able to afford the time and expense involved in service on the county council, which is unpaid. The councils usually meet during the day, and the fares for traveling to the county town amount often to a considerable sum. The result at present is that low polls and uncontested elections are frequent; little interest is shown in county elections in the majority of cases; and in most counties the council is drawn from the well to do or leisured or landed classes. In consequence the social outlook of the counties tends generally to be conservative. But the administration is pure and incorrupt; the county officials are usually men of considerable ability; and a seat on the county council is regarded as something of an honor. The position is, however, in a state of flux, and the next decade may witness far reaching changes.

The county councils are linked together in a

powerful body known as the County Councils Association. This body forms the external policy and defends the interests of the county councils. It also represents them in negotiations with the central government or other local authorities.

COUNTY GOVERNMENT, UNITED STATES. The county is the most common area of local government in the United States. Each of the forty-eight states is divided into counties except Louisiana, where such districts are known as parishes. With the exception of Indian and other government reservations and some cities every part of the territory of the United States is in a county. The county government of each state is established by its own constitution and laws. There are large variations in county organization between the different states, but important features of similarity inevitably result from the common origin in the English county of the seventeenth century and the active intercourse between the several states.

When the American colonies were first settled England was divided into shires, or counties, and these in turn into parishes, while there were also other districts, known as hundreds, manors and boroughs. The principal county officials were the lord lieutenant, the sheriff, the coroner and justices of the peace. All but the coroner were appointed by the crown, but in practise local administration was largely decentralized. The lord lieutenant was head of the militia

system. The sheriff was chief conservator of the peace and executive officer of the centralized judicial courts. Local affairs were mainly in charge of the justices, acting in some matters individually and in others in petty or special sessions of several justices, while the justices in each county met in quarterly sessions as a criminal court and as the fiscal and administrative authority for the county.

Counties were early established in some of the American colonies and had been organized in most of them before the revolution, with officials similar to those in England. But some important changes were made in certain colonies. About the end of the seventeenth century locally elected county boards of various types which acquired the fiscal and administrative functions of the justices were established in New York, New Jersey and Pennsylvania. In Pennsylvania the office of sheriff was made locally elective in 1705. County treasurers were provided first in Massachusetts in 1654, local prosecuting attorneys in Connecticut in 1704. Records of deeds were created in most of the colonies. The development of town government reduced the importance of the county in New England and to a smaller extent in the middle colonies. Parishes, manors and hundreds were established in some colonies but soon disappeared. A number of boroughs and cities were also established.

Many of the first state constitutions included provisions concerning county government, with minor changes in the direction of a more decentralized system, such as provisions for legislative appointment or local election and the fixing of definite terms of office. Further changes in the same direction took place during the first half of the nineteenth century as settlement moved westward. Voting rights were extended, elective county boards were introduced and other county officials were made locally elective and their number increased. Toward the end of this period constitutional restrictions on the formation of new counties were adopted. Since the Civil War counties have been organized throughout the country and the scope of county administration has increased. But except for a few recent experiments and some state supervision of county administration the decentralized and disorganized regime of county officials has remained, often imposed by constitutional provisions.

About two thirds of the state constitutions contain numerous provisions relating to county

officers and restrictions on the formation of new counties, on special legislation and on local debts. The exceptions are mainly in New England and other states, such as Iowa, Oregon and Wisconsin, where there has been no general constitutional revision since 1860. Provisions as to the formation of new counties usually require the consent of the voters concerned and fix a minimum area—commonly about 400 square miles but ranging from 275 square miles in Tennessee to 900 square miles in Texas. Some constitutions also require a minimum population, ranging from 1000 in North Dakota to 10,000 in Ohio. A few states authorize cities with more than a certain population—100,000 in Michigan and Missouri, 20,000 in Minnesota—to be organized as counties without regard to the minimum area. About a third of the states require a local referendum for changes in county lines and about the same number require a local vote, in some cases more than a majority, for a change in the county seat. Except in a few of the southern and western states the creation of new counties or the readjustment of county boundaries rarely occurs.

There are more than 3000 counties in the United States. Most of the larger states have from 60 to 100 counties. Texas has 254, the largest number; Rhode Island with five and Delaware with three have the fewest. In area and population there are wide variations, not only over the country as a whole but within many of the states. Nearly two thirds of the counties have an area of from 300 to 900 square miles, the most usual area being from 400 to 650 square miles. But Bristol county, Rhode Island, contains only 24 square miles, while San Bernardino county, California, has 20,000 square miles. Most counties have from 10,000 to 30,000 inhabitants; but there are many counties below and above these limits. Thus Crane county, Texas, had a population of 37 in 1920, while Cook county, Illinois, had over 3,000,000. In New England, county areas are somewhat larger and population much greater than in the typical county. In the north Atlantic states most counties have over 50,000 population. In the southern states counties are usually smaller than the average both in area and population; in the western states, much larger in area and smaller in population than elsewhere. About two thirds of the counties are distinctly rural areas, in which the largest village or city has less than 5000 population and often less than 2500. About a fourth of the counties include along with a substantial

proportion of rural population and some villages a city of 5000 to 25,000 population. In about a twelfth of the counties the urban population distinctly preponderates.

The great majority of American counties are much smaller in population than counties in England or the corresponding districts in other countries. This reduces the importance of the public business to be carried on. Under present conditions of transportation many American counties are too small both in area and population for efficient public administration.

Like most other local governments the county occupies a dual position. On the one hand, it is a subdivision of the state for the administration of state laws and, on the other hand, it is a district for local administration. In England until recently and in the early days in America counties were primarily administrative districts for the general government and were not recognized as having the status of a legal corporation. They are now referred to as bodies corporate and politic and are recognized as public corporations. In most states they are considered quasi-corporations but in some they are included in the class of municipal corporations. As corporations they may within the scope of their powers acquire, hold and dispose of property, make contracts and incur debts and sue and be sued in the courts. But their property is more subject to legislative control than is the property of cities, while the county is ordinarily not liable for damages in cases of torts committed by county officials and employees.

Counties differ further from municipal corporations in that they are created by the state and not established voluntarily by the local inhabitants. Their functions as agents of the state government are so important that it has been held in a judicial opinion that counties "exist only for the purpose of the general political government of the state. They are the agents and instrumentalities the state uses to perform its functions. All the powers with which they are entrusted are the powers of the state, and the duties imposed upon them are the duties of the state" (*Madden v. Lancaster Co.*, 65 Fed. Rep. 188, 191; 12 C.C.A. 566). A more conservative statement by another court holds that "a county organization is created almost exclusively with a view to the policy of the state at large" (*State v. Downs*, 60 Kans. 788).

Primarily the county is a district for the administration of justice, the enforcement of law and the maintenance of peace and order. Courts
